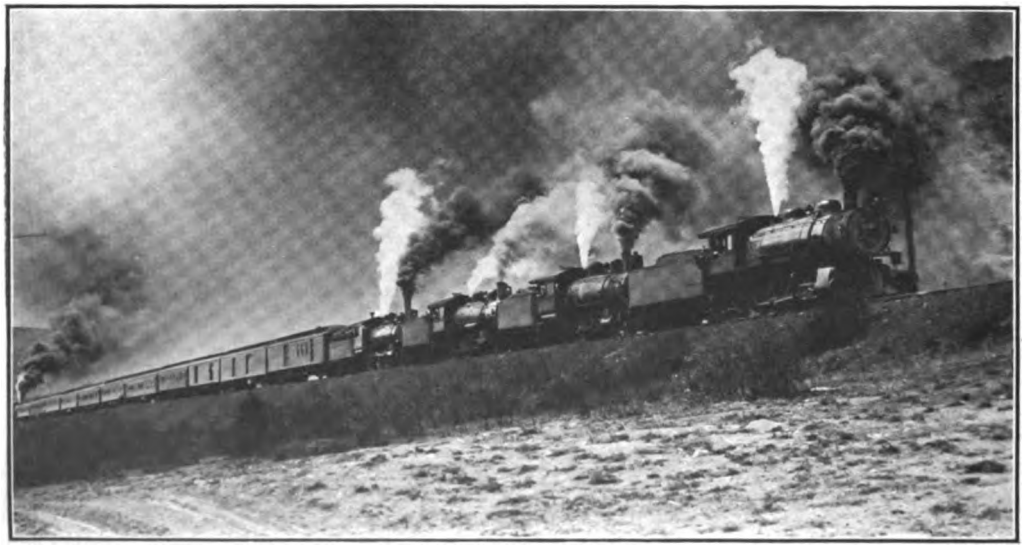
ONE of the most important pieces of railroad work that is being done in the West this year is the reconstruction of the Denver and Rio Grande Railway grade between Soldier Summit and Tucker, Utah. According to the contract, the work is to be completed August 1st, 1913. The job will cost $1,500,000.

The Soldier Summit grade, where the Denver and Rio Grande double track crosses the Wasatch Mountains in Utah, is one of the heaviest



DENVER AND RIO GRANDE PASSENGER TRAIN CLIMBING SOLDIER SUMMIT, WASATCH MOUNTAINS, UTAH.

Digitized by Google

hauls in the Western states. The old line between Soldier Summit and Tucker is seven miles long, the grade being 4 per cent, or 211 feet to the mile.

The new piece of road will have one 255-foot tunnel. Numerous concrete arches will be built instead of bridges. When finished, the line between Soldier Summit and Tucker will be fifteen instead of seven miles long, but the grade will be reduced from 4 per cent to 2 per cent, or 105½ feet to the mile. Jordan Narrows gravel will be used in ballasting, and 90-pound steel rails will be laid.

The cost of this improvement is enormous, but it is more than justified by the reduction in curvature and grade. The increase in mileage and the decrease in grade may be said to balance fairly even, while the railroad will profit by reduction of curve and elimination of continual bridge expense.

The reconstruction of this piece of road was necessary because of the enormous traffic at that point. Heavy coke and coal shipments go from the Utah mines to Salt Lake, and the Montana and Nevada smelters, each day. The cost of maintaining "helpers" for the many freight and passenger trains has always been a big item.

Prospective increase in freight business after the opening of the Panama Canal, and passenger business during the Panama-Pacific Exposition probably exerted considerable influence in the matter of bringing about this commendable improvement.

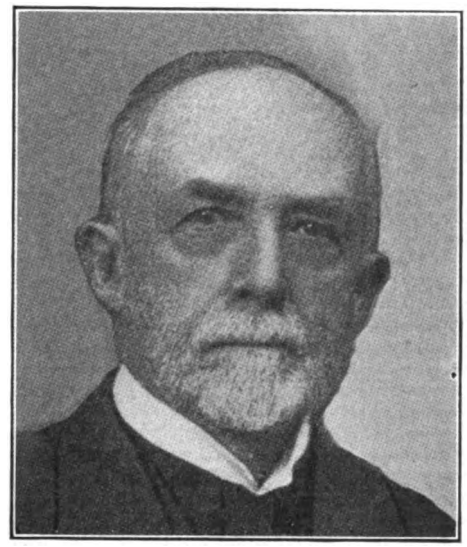
Personal

A. T. Hardin.

A. T. HARDIN, who was on April 1st. elected vice-president of the New York Central and Hudson River Railroad, entered railroad service in 1882, as telegraph operator on the Richmond and Danville Railroad, with which road he stayed until 1894 when he procured a position in the maintenance of way department of the Southern Railway. In 1898, he was appointed supervisor and division engineer of the New York Central and Hudson River Railroad, and in September, 1899, was made engineer of track of the same road. In 1893, he became engineer of maintenance of way and in 1905 assistant to general manager, becoming assistant general manager in 1906. This position he held until April 15, 1912, when he was elected assistant vice-president, holding this position until his recent election to the vice-presidency.

William Mahl.

WILLIAM MAHL, vice-president and comptroller of the Southern Pacific Company at New York, voluntarily retired on April 7th, under the pension rules of the company, after 53 years' continuous railroad service, 31 of which were in the service of the Southern Pacific Company. Mr. Mahl was born in Carlsruhe, Baden, December 19, 1843, and came to America with his parents in 1852. In 1860 he was entered as an apprentice in the shops of the Louisville & Nashville. In four years he became successively a machinist, a draftsman and chief clerk in the mechanical department. From 1864 to 1872 he was auditor and purchasing agent of the Louisville, Cincinnati & Lexington. For a few years he served under Colonel Thomas A. Scott, as auditor, purchasing agent and financial agent of the Texas & Pacific. Soon after the panic of 1873, he returned to the Louisville, Cincinnati & Lexington, becoming its general superintendent. In February, 1882, Mr. Huntington called him to New York, where he served successively as general agent, comptroller and assistant to the president of the Chesapeake & Ohio and the Southern Pacific and the various collateral railways, steamship lines and other large interests of Mr. Huntington. After Mr. Huntington's death Mr. Harriman extended Mr. Mahl's functions so as to cover the entire Union Pacific and Southern Pacific systems. He was vice-president and comptroller of both systems from October, 1909, until the Union Pacific and the Southern Pacific were separated under an order of the Supreme Court; and on February 6, 1913, resigned from the Union Pacific.



WILLIAM MAHL.

J. J. Bernet.

J. J. BERNET has been appointed vice-president of the Lake Shore & Michigan Southern, Lake Erie & Western, Cleveland, Cincinnati, Chicago & St. Louis, Michigan Central, Peoria & Eastern, Cincinnati Northern, Toledo & Ohio Central, Zanesville & Western, Chicago, Indiana & Southern and the Indiana Harbor Belt, in charge of operation, maintenance and construction, with headquarters at Chicago. Mr. Bernet was born February 9, 1868, at Brant, Erie County, New York; educated in the public schools of Buffalo, and began railway work in 1889 as telegraph operator for the Lake Shore & Michigan Southern. He was advanced to train

J. J. BERNET.

despatcher in March, 1895, was trainmaster of the Eastern Division from April, 1901, to March, 1903, when he became assistant superintendent of that division. On February 1, 1905, he was made superintendent of the same division, and in November of that year, he was promoted to assistant general superintendent of that road, which position he retained until October 1, 1906. He was then advanced to the general superintendency, with headquarters at Cleveland, Ohio. Mr. Bernet subsequently, on June 1, 1911, was made assistant to vice-president of the New York Central lines west of Buffalo, and was appointed assistant vice-president of the same lines on April 15, 1912. He now becomes vice-president of those roads.

J. W. Taylor.

J. W. TAYLOR, recently appointed assistant to the president of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, began his service as messenger in the office of the St. Paul's car department at Milwaukee, Wis., in 1888. He subsequently filled several positions in the mechanical department until 1904. He then was promoted to general storekeeper, and five years later, in 1909, he was made a division superintendent. The following year, in 1910, Mr. Taylor became assistant to the comptroller, which position he held until March 15th, of this year, when he received the appointment of assistant to President Earling.

Clark B. Ferry.

CLARK B. FERRY, recently elected vice-president of the Chicago, Milwaukee & St. Paul, with headquarters at New York, was born on May 18, 1859, at Bethel, Conn. From 1868 to 1873 he was a student at the Trinity Institute, Tivoli, N. Y., and in 1875 he graduated from Essex Hall Institute, Orange, N. J. On June 30th, of the same year, he began railway work as a clerk in the financial office

CLARK B. FERRY.

of the Chicago, Milwaukee & St. Paul, and has been in the continuous service of that road ever since. In January, 1883, he was elected assistant secretary, and on April 8th, was elected also vice-president of the same road.

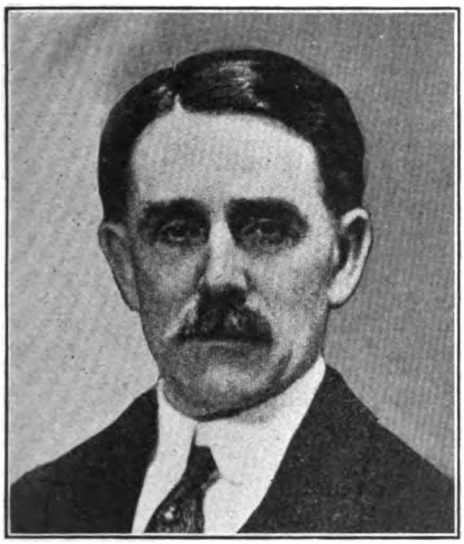
Lewis Lukes.

LEWIS LUKES, recently appointed assistant to the president of the Canadian Northern Railway, and to MacKenzie, Mann & Company, with headquarters at Toronto, Canada, was born at Yorks Mills, Ontario, November 14, 1854, and after receiving a common and high school education, entered railway service in 1878 as general clerk at Collingwood, Ontario, to the contractors who were at that time engaged in the construction of the Hamilton and Northwestern Railway. In 1879 he became pay clerk and bookkeeper for the same construction company at St. Ignace, Michigan, who were at that time engaged in the construction of the Mackinaw and Marquette Railway. In 1881 he became general clerk at the

Digitized by Google

LEWIS LUKES.

head office Toronto, during the construction of the Ontario and Quebec Railway, and in 1883, was made cashier at the end of track on the Canadian Pacific Railway's main line from Medicine Hat to Revelstoke. In 1886 he became general representative of the contractor in the construction of the Canadian Pacific Railway from Montreal to St. Johns, and from 1890 to 1897, he was engaged in the railway contracting business. In the latter year, he became associated with Mackenzie, Mann and Company as manager of construction, and in March of the present year. was made assistant to the president of this company and of the Canadian Northern Railway.



C. A. Morse.

CHARLES A. MORSE, who has resigned as chief engineer of the Atchison, Topeka & Santa Fe System to become chief engineer of the Rock Island Lines, was born at Bangor, Me., January 1. 1859. He was educated at the University of Maine and in 1880, entered railway service with the Chicago, Burlington & Quincy R. R., and as chainman, instrument and office man, remaining with that road until its completion in 1884. After service with the Mexican Central Ry. as division engineer, Mr. Morse was again with the Burlington for a year and a half. He accepted a position as transitman with the Atchison, Topeka & Santa Fe Ry., in January, 1886. After serving as division engineer and resident engineer in July, 1901, he was made assistant to the chief engineer at Topeka, Kas. From February, 1902, until March, 1903, he was principal assistant engineer at La Junta, Colo., and from that date until July of the same year division engineer at Topeka. He was then appointed acting chief engineer and served in that capacity until his appointment as assistant chief engineer, July 8, 1904. From September 1, 1905, until his appointment to the office of chief engineer Mr. Morse was acting chief engineer of the Coast Lines of the Santa Fe System.

C. F. W. Felt.

C. F. W. Felt, who, on April 1st, became chief engineer of the Atchison, Topeka & Santa Fe System, with headquarters at Chicago, was born April 29. 1864, at Salem, Mass. He was graduated from the Massachusetts Agricultural College in 1886, and began railway work in September of that year with the Atchison, Topeka & Santa Fe Railway. From September, 1886, to October, 1887, he was rodman and later until February, 1888, was bridge engineer. He was then for three months with the Denver & Rio Grande as levelman; from August, 1888, to April, 1889, instrument man for the Arizona & Southeastern, and from the latter date to February, 1890, transitman on the Topolobampo line in Mexico. In April, 1890, Mr. Felt was made resident engineer of the Northern Division of the Gulf, Colorado & Santa Fe at Cleburne, Tex., and in July, 1892, he went to the Rio Grande & Southern as office engineer, returning to the Gulf, Colorado & Santa Fe in February, 1893, as division engineer.

Digitized by Google

Three months later he was transferred to Galveston, Tex., as resident engineer, and in September, 1896, he was promoted to chief engineer of the Gulf lines of the Santa Fe at Galveston, which position he held for thirteen years, being advanced to chief engineer of the Eastern and Western lines, with office at Topeka, Kan., in November, 1909. This position he held until his recent appointment.

John B. Berry.

JOHN B. BERRY, heretofore chief engineer of the Rock Island Lines, is to be assistant to the president. Mr. Berry entered the employment of the Chicago & North-

western Ry. in 1878, and was engaged in various capacities in the engineering department until 1893. He then went to Omaha, Neb., as chief engineer of the Fremont, Elkhorn & Missouri Valley R. R. He remained in that position five years. In 1898 he was appointed chief engineer of the Union Pacific R. R., where he remained seven years. In 1905 he was appointed chief engineer of the Rock Island Lines, which position he has occupied to the present time. Mr. Berry's work in the reconstruction of the Union Pacific Railway forms an important part of the railway engineering history of the country.

W. E. Morse.

W. E. MORSE has been appointed general manager of the Denver, Northwestern & Pacific Railway. Mr. Morse was born September 27, 1864, and entered the railway service December, 1881, with the Chicago & Northwestern Ry., as telegraph operator. After holding various positions in the station service, in 1884 he was made train dispatcher. From 1887 until 1897 he served as train dispatcher and assistant superintendent and from 1897 to 1906 as superintendent of various districts of the Northwestern. He was appointed general superintendent in 1906, serving in that capacity until October, 1910, when he was ap-

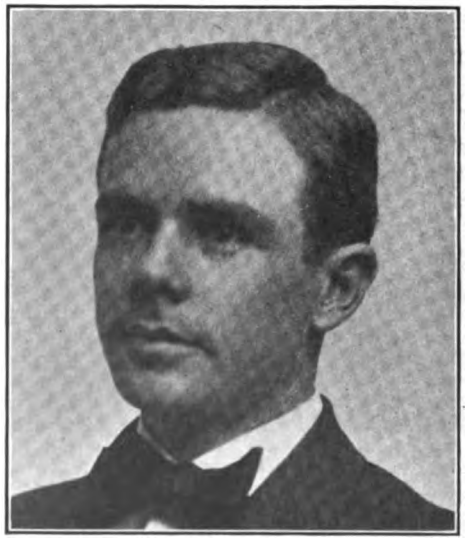
pointed assistant general manager. Mr. Morse's health compelled his resignation in March, of last year.

H. W. MacKenzie.

HENRY W. MACKENZIE, who was recently appointed comptroller of the Seaboard Air Line Railway, with headquarters at Portsmouth, Virginia, was born on December 30, 1876, in Hampton County, South Carolina. He was educated in the common schools and entered railway service on May 1, 1891, with the Florida Central and Peninsular Railroad. He filled various clerkships with this company until July, 1900, on which date that road became part of the Seaboard Air Line Railway, and Mr. MacKenzie was made bookkeeper for the comptroller. He occupied this



H. W. MACKENZIE.

Digitized by Google

position until February 1, 1902, when he became general bookkeeper. In 1906, he was made assistant to the comptroller and on February 19, 1913, he was appointed to his present position.

C. J. Jones.

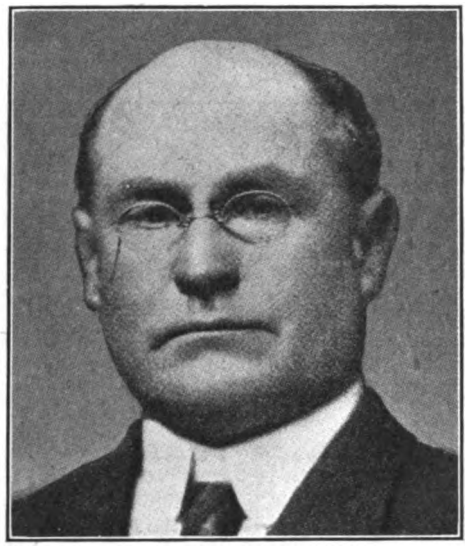
C. J. Jones, who, on April 1st, became general freight agent of the Southern Pacific, with headquarters at San Francisco, Cal., began railway work in 1880 with the Burlington, Cedar Rapids & Northern at Muscatine, Iowa, as a telegraph operator and clerk in the local freight office. after completing a high school course. He went to the Arizona & New Mexico in 1883 as trainmaster and agent at Lordsburg, N. M., and entered the service of the Southern Pacific in 1887. He was employed by that company as local agent and trainmaster at various places until 1901, when he was appointed district freight and passenger agent at Sacramento, Cal. Two years later he was made freight agent at the San Francisco local station, and in 1904 he was promoted to assistant general freight agent.

C. J. JONES.

He left the Southern Pacific in 1910 to accept the position of traffic manager of the Alaska Steamship Company and the Copper River & Northwestern, with headquarters at Seattle, Wash., and now returns to the Southern Pacific as general freight agent.

E. Richards.

E. RICHARDS, recently appointed superintendent of the St. Louis Southwestern Ry. at Pine Bluff. Ark., entered railway service as telegrapher with the Chicago & Alton R. R. in 1881. After similar service with the Wabash R. R. National Ry., of Mexico, and St. Louis Southwestern lines, Mr. Richards served as train dispatcher, chief train dispatcher and trainmaster of the Cotton Belt; 1899 and 1900, general manager of the Louisiana & Arkansas Ry.; 1901, train dispatcher, Chicago & Northwestern Ry., at Boone, Ia.; 1901, chief train dispatcher, Missouri, Oklahoma & Gulf Ry.; 1902 to 1905, chief train dispatcher, St. Louis &



E. RICHARDS.

Southwestern Ry., of Texas; 1905 and 1906, trainmaster, Louisiana Ry. & Navigation Co., Shreveport, La. In 1907 he returned to the Cotton Belt as assistant superintendent at Pine Bluff, Ark., was transferred to the Fort Worth Division as superintendent in October, 1912, and remained at that post until his recent appointment, March 27th, as superintendent at Pine Bluff.

Charles Forrester.

CHARLES FORRESTER, who has been appointed superintendent of the Stratford Division of the Grand Trunk. with headquarters at Stratford, Ont., was born on March 5, 1876, at Wanstead and was educated in the public school of his native town and at the high school at Petrolea. He began railway work on July 15, 1891, with the Grand Trunk, and has been in the continuous service of that road ever since.

Obituary

George T. Nicholson.

ON Sunday. March 30th, there passed away in Los Angeles, George T. Nicholson, vice-president of the Santa Fe, in charge of traffic.

George T. Nicholson was born in Belvidere, N. C., on July 1, 1856. He was educated at Earlham College, Richmond, Ind., and at the University of Kansas. At Lawrence he married Julia Watson, who, with one daughter, survives him.

He entered Santa Fe service in 1882 as a clerk in the general passenger and ticket office, since which he has been consecutively rate clerk, chief rate clerk, chief clerk, assistant general passenger and ticket agent and general passenger agent. From February 1, 1897, to May 1, 1898, he was general passenger agent of the St. Louis & San Francisco Railway, but was recalled by the Santa Fe to become passenger traffic manager. From October 4. 1905, until his death he was vice-president in charge of all traffic matters.

Opportunity opens the door wide for those entitled to enter. It wasn't magic or luck or "pull" that made Mr. Nicholson's life so brim full of success. He earned all he got; that type of individual rarely gets all he earns, because it is difficult fully to reward the work that is done for work's sake. The answer is evident. He made it a point to keep in training for the job higher up.

Mr. Nicholson studied hard; he took infinite pains; he didn't watch the clock; he dug things out for himself. and he was trustworthy, a man of unquestioned integrity. Brains, plus hard work, plus character, is a combination bound to win.

The following resolution was passed by the directors of the Santa Fe in session in New York on April 1st:

WHEREAS, George T. Nicholson, vice-president of this company, departed this life at Los Angeles, Cal., on Sunday. March 30th, 1913, after a brief illness and following a surgical operation; therefore, be it

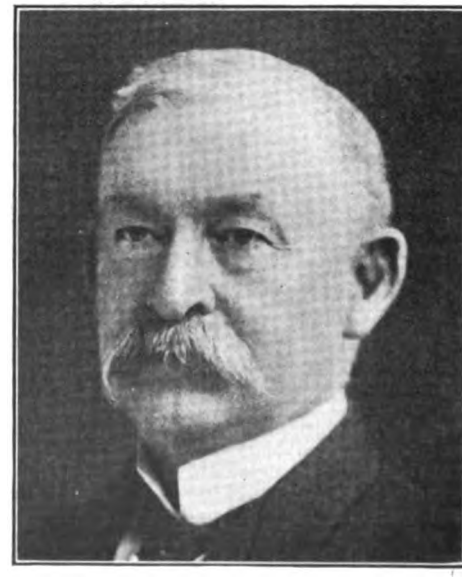
RESOLVED, That we hereby express our most profound sense of bereavement and our deepest regret. We appreciate, as fully as possible, the great work done by Mr. Nicholson for this company in his thirty-one years of arduous official service. We appreciate also his rare qualities as a gentleman, a citizen and a friend. At all times gentle and kindly and generous, he won not only the highest respect of his business associates, but, as well. the affectionate regard of all who knew him. He was at once a leader in his profession and a simple, unostentatious and lovable man, loyal to his friends and faithful at all times in all things to all his obligations.

Charles E. Pugh.

CHARLES E. PUGH, former first vice-president of the Pennsylvania Railroad Company, died at Old Point Comfort, Va., on April 8th.

Mr. Pugh retired from the service of the Pennsylvania Railroad Company on March 1, 1911, after having served it fifty-one years and five months, and having risen from station agent at Newport, Pa., to the second highest office in the organization of the railroad.

His record with the company was indicative of its policy of starting its employes at the lowest round of the ladder and advancing them step by step in any regular department. Born at Unionville, Chester County, Pennsylvania, on February 25, 1841, all of Mr. Pugh's activities were confined to Pennsylvania. His early education was received in the district school of Unionville, while later on he attended the State Normal School at Millersville, Lancaster County.



CHARLES E. PUGH.

Digitized by Google

Mr. Pugh entered the service of the Pennsylvania Railroad Company as agent at Newport, Pa., on October 1, 1859. To familiarize himself with all the details in the practice and theory attending the running of trains, he entered the train service and served as a passenger conductor for a period of six months. In 1864 he was appointed train dispatcher of the Philadelphia Division; on August 1, 1870, general agent for Philadelphia; on April 1, 1879, general superintendent, Pennsylvania Railroad Division; on October 1, 1882, general manager; on March 1, 1893, third vice-president, and on February 10, 1897, second vice-president.

Mr. Pugh, at the time of his retirement, was first vice-president of the Pennsylvania Railroad, Northern Central Railway, Philadelphia, Baltimore & Washington Railroad, and the West Jersey & Seashore Railroad, and was an officer in some fifty other corporations affiliated with the Pennsylvania Railroad System.

Peter S. Archibald, who was chief engineer of the Intercolonial Railway from March, 1878 to 1898, died on March 16, at his home in Moncton, N. B. He was born on March 18, 1848, at Truro, N. S., and began railway work in July, 1867, in the engineering department of the Intercolonial Railway, and held various positions in that department until his promotion to chief engineer. He resigned from that position in 1898, to become a consulting engineer.

Caspar Buhrer, formerly roadmaster of the Lake Shore & Michigan Southern at Sandusky, Ohio, and later superintendent of the tie and timber-treating plant of that road near Toledo, died at his home in the latter city on March 23rd, aged 58 years. Mr. Buhrer was connected with the Lake Shore some 35 years and had been roadmaster about 30 years. He retired about two years ago owing to ill health. Mr. Buhrer was the inventor of the Carnegie steel tie and one or two reinforced concrete ties.

Emil E. Kuersteiner, formerly bridge engineer of the Louisville & Nashville R. R., died at his home in Louisville, Ky., following a long illness, aged 55. He was born in New Orleans, La., and educated in Cincinnati, Ohio, and Zurich, Switzerland. In 1881 he returned to America and entered the service of the Cincinnati Southern Ry., as assistant engineer. He became connected with the Louisville & Nashville in 1898.

John R. McCord, formerly traveling passenger agent of the Cincinnati, Hamilton & Dayton, died on April 2nd, at Washington, D. C., at the age of 59.

Richard R. Metheany, secretary and auditor of the Grand Rapids & Indiana, died suddenly at Grand Rapids, Mich., on April 7th, aged 58 years. Mr. Metheany was born at Lima, Ohio, February 4, 1855, and had been in railway service since 1870, when he began as clerk in the auditor's office of the Grand Rapids & Indiana. From 1877 to October 1, 1895, he was chief clerk in the same office, and on the latter date was made secretary and auditor.

E. A. Peck, superintendent of the St. Louis Southwestern, with headquarters at Pine Bluff, Ark., was found dead near Hot Springs, Ark., on March 20th. It is stated that he committed suicide owing to continued ill health. Mr. Peck was 61 years old and had been superintendent at Pine Bluff since June, 1901. From June, 1893, to April, 1901, he was general superintendent of the St. Louis, Iron Mountain & Southern, and previous to December, 1892, he had been with the Cleveland, Cincinnati, Chicago & St. Louis for some years as an assistant general superintendent and general superintendent.

J. W. Petheram, formerly from October, 1893, to the latter part of 1909, chief engineer of the Missouri, Kansas & Texas Railway of Texas, died on March 26th at his home in Dallas, Tex., aged 70 years. Mr. Petheram was born in Largo, Scotland, and was educated at Madras College at St. Andrews, Scotland. He entered railway service in June, 1873, as resident engineer of the Credit Valley Railway of Canada, and from February, 1875, to August, 1879, was assistant engineer of the same road. From April, 1881, to January, 1884, he was successively chief engineer of the Georgian Bay & Wellington and assistant engineer of the Chicago & West Michigan, and was then until January, 1888, chief engineer of the latter road. Subsequently to October, 1893, he was general roadmaster of the Missouri, Kansas & Texas of Texas, and was made chief engineer on the latter date, which position he held for about sixteen years, when he sustained a stroke of paralysis, from which he never fully recovered.

Howard W. Rogers, traveling freight agent of the Illinois Central, with headquarters at Kansas City, Mo., died in that city on March 14th, aged 30 years.

George A. Rump, commercial freight agent of the Wabash R. R. at Cincinnati, Ohio, was drowned at Hamilton, Ohio, during the recent floods. Mr. Rump with two others were attempting to cross the river in a motor boat and on nearing the shore the craft was wrecked. His companions were rescued, but he was lost.

Reuben F. Smith, president of the Cleveland & Pittsburgh, with office in Cleveland, Ohio, died in the latter city March 11th, aged 92 years. He had been connected with the Cleveland & Pittsburgh since 1855, when he was made paymaster. He became auditor six years later, and in 1869 was chosen vice-president. Later, under lease of the property to the Pennsylvania Railroad, he was appointed assistant general manager of the Cleveland & Pittsburgh division of the Pennsylvania Lines West of Pittsburgh. Subsequently he was elected president of the Cleveland & Pittsburgh Railroad.

P. J. Tapp, commercial agent of the Southern, at Kansas City, Mo., died suddenly in that city on March 20th, aged 50 years.

Digitized by Google

Financial

J. Pierpont Morgan.

THE death of Mr. J. Pierpont Morgan overshadowed all other financial events during the past month. Obituaries of Mr. Morgan have repeatedly referred to him as a great constructive influence. This, in our opinion, is inaccurate. Mr. Morgan's work throughout his business career has been one of reconstruction, rebuilding and conservation. He was no pioneer, his interest was in the preservation and improvement of existing corporations, and what has been usually regarded as his greatest achievement—the United States Steel Corporation—was conceived in a desire to bring a number of potentially hostile interests in the steel trade into a working agreement.

We regard Mr. Morgan's greatest work to be the large number of railway reorganizations in which he figured. J. P. Morgan & Co., have been active in the financial development of nearly every important railroad in the country. Of companies which his house reorganized there come readily to mind the Reading, the Erie, the Baltimore & Ohio, the Chesapeake & Ohio, the Hocking Valley, the Richmond & West Point Terminal and the Northern Pacific. At an earlier date, acting in the interest of the New York Central, he acquired the West Shore for that company. These reorganizations were carried through on sound principles, although on drastic lines. Without exception they have justified the wisdom of the plan upon which they were founded.

Mr. Morgan's services to the railroad were not confined to financial reorganization. He was a pioneer in the field of complete publicity of railroad accounts. His advent to a position of control in the affairs of a railroad was signalized by the furnishing of complete information, not only in annual statements, but in monthly, and often in weekly returns. He was also responsible, more than any other man, for the establishment of harmonious relations among independent railway companies whose heads have learned in the course of years, largely as a result of his constant insistance, to avoid destructive and ruinous competition, and even though not bound together by organic corporate relations, to work in harmony for the common good.

Of Mr. Morgan's work in the field of banking proper this is not the place to speak. In all his work the secret of his enormous influence was the implicit confidence which all men had, not merely in his judgment, but also, and primarily, in his absolute integrity. The high reputation which he acquired forty years ago for direct and honest dealing was never marred by a single misstep. In his long life of constant activity in large financial affairs, not once was he accused of a questionable transaction. At the time of his death he possessed, in a higher degree than any other man in public or private life, in this or any other country, the absolute confidence and trust of the business world.

Improvement in Financial Situation.

THE financial situation has improved. The leading explanation for the marked relaxation of tension in the money market is the settlement of the Balkan War. While peace has not yet formally concluded, it is assured, and with the definite conclusion of peace it is believed that at least $500,000,000 of funds, which have been hoarded by investors and bankers, will be released for investment. During the stringency caused by the threatening political situation in Europe, New York bankers were forced to send nearly $50,000.000 of gold abroad. The general disposition to hoard and retrench was responsible for the heavy sales of American securities which proved more remarkable than foreign issues, and the decline in railroad securities carried down the entire market. During the past month the stock market in New York has shown much improvement. The surplus reserve of the New York banks has held steady between $12,000,000 and $14,000,000 and rates for both call and time money have been reduced. The Bank of England, the best indication of relaxation in the monetary situation, on April 17th, reduced its rate of discount from five per cent, at which figure it had stood since October 17th, to 4½ per cent. That the market has stood up so well is proof that the financial position of the country is inherently strong. In spite of numerous laws introduced to harass as well as regulate capital, in spite of a complete change in administration, in spite of the threat of tariff revision, continued unrest in Mexico, disastrous floods in the Middle West, the danger of foreign war, and the death of Mr. Morgan, the investment markets have shown a surprising amount of resistance to the natural effect of liquidation. With the improvement in the general situation which is now in progress, there is every reason to expect that the market will respond.

Decline in the Rate of Return on Railway Investments.

ACCORDING to figures compiled by a special representative of the Delaware & Hudson and made public in the recent report of President Loree, the rate of return on the capital invested in American railways is steadily declining. This is a new point and one which possesses the deepest interest for the public. Owing to the rapid growth in operating expenses there was available for interest and dividends in 1911, $9,000,000 less than in 1907, although the investment in road and equipment was $2,044,416,617 greater than in 1907. The railroads evidently received no return on the money which they have put into their property since 1907. The rate of return on the total investment, in no year since 1907, equalled the 5.8 per cent earned in that year.

This unpromising situation, looking at the railroads as a whole, is aggravated by the policies of certain States. To the natural hesitation of the investor to put his money into a business whose profits are stationary and declining in relation to the capital employed, is added the efforts of certain States which have not yet learned by experience to let the railroads alone. A recent illustration of this policy is the Public Utilities Bill which is now before the Colorado Legislature. Mr. William E. Green, president of the Denver, Laramee & Northwestern Railroad,

Digitized by Google

believes that no more railroads will be built in Colorado if the Public Utilities Bill is enacted in its present form. He bases this conclusion on the experience of Texas. "There has not been an independent road started and completed in Texas for the last fifteen years and I attribute that fact to the laws of the State restricting the issuance of railroad securities. Denver would to-day be without a through line to the Gulf of Mexico except for the fact that the Colorado & Southern and the Rock Island, two systems whose greatest mileage is outside of Texas, jointly undertook the construction of the Trinity and Brazos Valley Railroad."

President Green said that the Texas Commission allowed the new company only ten per cent margin for the sale of its securities. The bonds sold for 92 which left only two per cent to cover commissions, cost of seasoning the roadbed and other expenses incidental to the inauguration of efficient service on a new line. "Investors will not put money into a project where only a ten per cent margin is allowed to cover these costs and the incidental risks which accompany the transaction. The margin should be at least twenty-five per cent. The Trinity and Brazos Valley would never have been built if the two older systems had not undertaken the work."

President Green calls attention here to the consequence of restrictive railroad legislation which is probably not in the minds of those who advocate it. The effect of such laws is to confine the building of new railroads to systems with established credit. It is impossible to secure money for new railroad construction on such a narrow margin of discount as Public Service Commissions are disposed to allow.

Railway Financing.

WHILE the general business situation shows every sign of strength and resistency, the investment market is not encouraging. The reception given the St. Paul issue has been, to put it mildly, unenthusiastic. When the issue was first announced the following comment appeared in the Wall Street Journal:

"Applications for participation in the underwriting syndicate for the new $30,000,000 St. Paul general mortgage 4½ per cent bonds have resulted in a healthy over subscription for the issue. All bankers are willing to take a chance on a savings bank issue of this class that is to be brought out on a 4½ per cent basis. A strong syndicate has been formed, and it is expected in some quarters that the bonds will be put away with institutions and investors in a few days' time and the success of the sale will stimulate the market generally."

And then, a few days later, we have their comment in the same column:

"When it was published after two days of the offering that only one-half of the issue had been taken, bankers began to modify their views, but they still all maintained that the issue, with its price four points below other savings bank issues, would go to an over subscription before the closing of the books on the fifth day.

"For that reason the announcement that the issue failed to stimulate enough buying to absorb more than four-fifths of the total comes as a great surprise.——A strong banking syndicate reaching nearly all the investment pockets of the country is not able under present conditions to put away with the 'ultimate consumer' in five days $30,000,000 of the highest grade bonds even when they return nearly one-fourth of one per cent more than other such bonds."

Since this note appeared a considerable additional amount of bonds have been sold but the demand was not strong and the price has shown a tendency to lag.

This poor success of the St. Paul bonds is interpreted to signify a speedy readjustment in the prices of other savings bank bonds of this class. Atchison generals selling on a 4.22 basis, New York Central at 4.19, and Reading general 4½ at 4.17, it is unreasonable to expect that the cool reception given both the St. Paul and the Baltimore and Ohio, which also went mostly to the bankers, will fail to exert a depressing influence throughout the savings bank list.

Such a development, however, should not occasion suspense. It will only continue a movement which has been in progress for some time. The Wall Street Journals average for March of the prices of 25 representative bonds was below 87. This is eleven points below the maximum figures of 1906, and only five points below the low level of the 1907 panic. The most rapid decline, moreover, since 1907, has been during the last two months.

We refuse to accept the pessimistic conclusions as to the future of the bond market, which are naturally drawn from these figures. In our opinion, based on considerable inquiry among bond houses, the decline in these representative savings bank bonds, represent nothing more than a long deferred readjustment of prices, to bring these bonds to the proper position. The investor demands five per cent; that is the substance of the situation, and railroad bonds are in the march to meet his demand. The monopoly of the conservative investors' favor, which railroads have long enjoyed, has been broken. While railroad bonds will always sell at higher prices than competing public utility and industrial securities, the difference in quotation will not be so great as in the past.

The Policy of the Pennsylvania.

THIS leads us naturally to comment upon the policy of the Pennsylvania in adding ten per cent by subscription to its enormous stock issue. With the addition of this allotment the capital stock of the Pennsylvania will fall just short of $500,000,000. It has always been recognized among bankers that the finances of this company have been managed by men who have shown singular ability in forcasting financial tendencies. For many years, the Pennsylvania has relied upon its stockholders to furnish its capital and has increased its debt at a much slower rate. At the end of their last calendar year, the capital stock of the Pennsylvania was more than double its funded debt. The policy of favoring stockholders has resulted in the building up of a margin of value above the bonds which would enable the company in case of need, to utilize its credit on very favorable terms. In times past, the Pennsylvania could have obtained money readily at four per cent. It sold six per cent stock instead and it maintained its dividend. To-day its directors, with the enor-

Digitized by Google

mous stock interest to draw upon, can undertake the most extensive program of improvements, with utter indifference to the course of bond prices.

The decline in railroad bonds, will, we believe, result in a general return to the old-fashioned methods of finance, so well exemplified by the Pennsylvania, by which the owners of a company furnish the money for the expansion of its business.

New Issues During First Quarter of 1913.

READJUSTMENT in bond values is having its effect in deterring new issues. During the first quarter of 1913, according to New York "Journal of Commerce," the total of new securities announced by railroad and industrial corporations showed a decline of $139,322,000 as compared with last year. For almost the whole of this decrease the railroads were responsible. When we express this decline in percentage here—18 per cent upon the $750,892,000 of the first quarter of last year, we can realize that with $611,570,000 of new securities issued, the investment market is still capable of furnishing an enormous sum of money for the continuous service of industrial expansion. General business, about equally divided in its dependence upon the crops and the supply of new capital to maintain its volume, shows little signs of slacking.

The Tariff and Business.

APPREHENSION is felt in some quarters over the probable consequences of what Herman Sieckles ably termed the "Tariff for Politics" as distinct from the tariff for either revenue or protection. In the textile industry, the hesitation is most marked and the distribution trades show some falling off. Other basic industries, however, continue to expand. The iron and steel industry is especially prosperous. The crop outlook is even better than last year, showing indeed, practically no unfavorable indications. If the Democratic administration can be "assimilated" by the spirit of business progress, if President Wilson and his advisors can be brought by the logic of circumstances to think less of changing the basis of division and more of increasing the amount to be divided, there is nothing in the path of a rapid advance of the United States to an era of greater prosperity than the people ever before enjoyed.

Railway Business for February.

RAILWAY business in the United States for February was slightly greater than for the corresponding month of 1912. This is indicated in statistics compiled by the Bureau of Railway Economics from the reports of steam railways, operating over ninety per cent of the mileage of the country, to the Interstate Commerce Commission.

The returns for February average as follows per mile of line: Total operating revenues per mile amounted to $1,015, which is 5.3 per cent greater than in February, 1912; operating expenses per mile amounted to $756, or 6.4 per cent greater than in 1912; net operating revenue per mile amounted to $259, or 2.4 per cent greater than in 1912. Taxes amounted to $46 per mile, an increase of 5.7 per cent. Operating income, which is what is available for rentals, interest on bonds, appropriations for betterments, improvements, and new construction, and for dividends, after the payment of operating expenses and taxes, amounted in February to $212 per mile. This represents an increase over February 1912, of less than four dollars a mile, or 1.8 per cent.

As February contained twenty-nine days in 1912, and but twenty-eight days in 1913, the returns for this month of the current year, other things equal, would be somewhat less than for February, 1912. A comparison of operating income on the basis of income per mile per day eliminates the effect of the extra day in 1912. On this basis operating income per mile per day averaged $7.58 in February, 1913; $7.19 in 1912, and $6.49 in 1911.

The railway returns here presented are for the month ending February 28th, and do not reflect the recent impairment of railway operating conditions on account of floods in the Middle West and the South. It will not be possible to trace the effect of these impaired conditions in the railway record until the returns for March, April and later months are available.

Interest in railway earnings always centers in these roads which have figured in the news of recent days because of realized or threatened misfortune. This month's record of such companies is encouraging. Take Missouri Pacific, for example; this company under the improved management which it now enjoys, has made a remarkable recent improvement. Gross earnings for eight months to February 28th, were $5,494,000 ahead of the same period of last year, and net earnings $3,253,000 ahead, this too, after the expenditure of $1,261,000 additional on maintenance. In place of a deficit to April 7th, of last year of $1,200,000, indications are that this year will show a surplus of $1,800,000 over charges. Flood damage will not amount, it is believed, to more than $300,000, the amount of the flood loss sustained last year.

The Wabash is another Gould property, although Mr. George Gould announces that he has personally been out of the company for several years, which shows great improvement. March earnings of this company increased over eleven per cent and February earnings nearly twelve per cent. Flood damage, which it was first feared would be severe, will not amount to over $150,000.

St. Paul, while showing a slight loss in net earnings in February, has every reason to be satisfied with the year's showing, up to this time. On March 1, 1912, net operating income was about $950,000 behind the figures of 1911. This year, operating income for eight months shows an increase over last year of $7,829,479.

Rock Island in the West and Erie in the East are companies whose financial situation has not in 1912, been especially promising. Each of these companies shows a marked gain in net earnings over last year. Rock Island lines gained $1,300,000 net after the deduction of taxes in the eight months ending February 28th. At the same time, maintenance expenses were increased $1,800,000 to the evident benefit of the property.

Operation

Progress of the Safety First Movement.

THE "Safety First" movement continues to attract an enormous amount of attention on the part of railway officials and employes. As we have previously noted, the original enthusiastic and rather unorganized efforts to this end are giving way to a calm and more scientific method of approach. The work already done is being critically analyzed in order to determine in what respects it may be improved or augmented. The result is that while there has been no marked or radical development during the month under review, a large amount of very useful work has been done.

Upon motion of Commissioner Cram, the New York Public Service Commission, First District, ordered a hearing at which representatives of the large railroad companies centering in New York City, and the manufacturers and distributors of electric current were represented. The engineering staff of the New York Central, Pennsylvania, the Edison Companies of New York and Brooklyn and the Interborough Rapid Transit Company, besides many others, were present.

A code of thirty-one rules drawn up by the electrical engineer for the Public Service Commission was submitted. The point was made by some of the representatives present that these rules might not apply fairly in all cases. After considerable discussion the Commission requested the representatives present to submit a series of rules applicable to their respective cases at a future meeting, the date of which has not yet been set.

One of the most important developments of the month has been the issuance of a call by Mr. A. T. Smallen, safety supervisor of the St. Paul System, for a meeting of safety supervisors, to be held in Chicago on April 21st. Thirty-four railroads have signified their intention of being represented. The purpose of the meeting is to discuss the advisability of forming a national organization for the promotion and extension of this movement.

It is becoming increasingly apparent that the problem which must now be solved in this movement is to get the men to put into practice the principles which they so readily accept. Experience has demonstrated that hardly a railway employe will fail to appreciate theoretically the advantages to himself, the company and his associates from this work. The difficulty is to maintain his interest to the point where it will affect his actions and thus make the movement not a theory but a condition. This is one of the problems which will be discussed at the Chicago meeting, and it is hoped that from the discussion it will be possible to evolve plans by which this condition can be successfully handled.

Numerous experiments are being tried to effect this result. The General Safety Agent of the New York Central Lines, for example, has issued to the members of the safety committees of his road a circular letter asking each member on all of the committees to personally see and canvass the matter with three employes in his own branch of the service, and to point out, if possible, in what respect the three individuals handled their work in a way which endangered them or their fellow employes. The success of this experiment will be watched with interest. In some quarters there is a feeling that perhaps the matter of "dont's" has been overdone in the safety campaign, and that not sufficient attention has been paid to constructive work or positive suggestions. It is also coming to be recognized that in the long run the real success of the safety first movement will lie in the care and thoroughness with which new employes who come into the service from time to time are trained. It is as easy to teach a man the proper way to handle his new task as a slipshod and careless way. It is believed that if men can from the outset be impressed with the necessity for care, and the absolute adherence to well devised methods of handling their work, that the corrective part of the movement will be very much reduced in the course of a few years.

Mr. R. C. Richards, of the North-Western System, has made the telling point that the greatest measure of success in this work can only be achieved if it does not appear to be disciplinary in its nature; in other words, the movement must come from among the men themselves rather than as a disciplinary measure by the owners. What discipline there must be in the long run, as against persistent offenders, should be dealt out, if possible, after mature judgment has been passed by representatives of the men. Through co-operative efforts of this character it is believed the final solution of the question will come.

Mr. Richards has made public some comparisons showing the results of the work on his system. Comparing the year ending June 30th, 1910, with that ending June 30th, 1912, the reduction in killed and injured trainmen, switchmen, trackmen and bridgemen averages roughly from 40 per cent to 50 per cent. Even the casualities to stationmen have been very materially reduced. The only lines in which there has been an increase in those killed and injured is in the case of car repairers and unclassified employes. The total number of killed in 1910 was 353, while in 1912 the number was 249. The number of injured in these years was respectively 10,163 and 7,115.

The Whisky Habit and Safety.

IT is the opinion of Mr. C. W. Egan, general claim agent of the Baltimore and Ohio, that the whisky habit is perhaps the greatest evil with which the railroad has to deal, and that it lies at the root of more accidents than any other single factor. The Pennsylvania system evidently subscribes to the same doctrine, for it is announced that a new system of inspection is to be inaugurated to prevent employes who have taken spirituous liquors from going to work. Inspectors have been appointed whose duty it shall be to discover whether the men have been drinking whisky, by detecting it on their breath, or in any other way which may be available. Those who persistently offend are to be discharged.

Innovation in Safety Work.

THE Chicago and Alton has prepared a number of maxims, which have been printed in the form of a bulletin, and distributed to the employes. Among the most catchy of these mottoes are the following:

Digitized by Google

"One accident occurs every fifteen minutes of each day of each year.

"It is the men and not the stockholders, officers or foremen who are being killed or injured.

"We want to stop making cripples, widows and orphans.

"A minute of judgment is sometimes worth a day of energy.

"Do not think because an accident has not happened it won't happen.

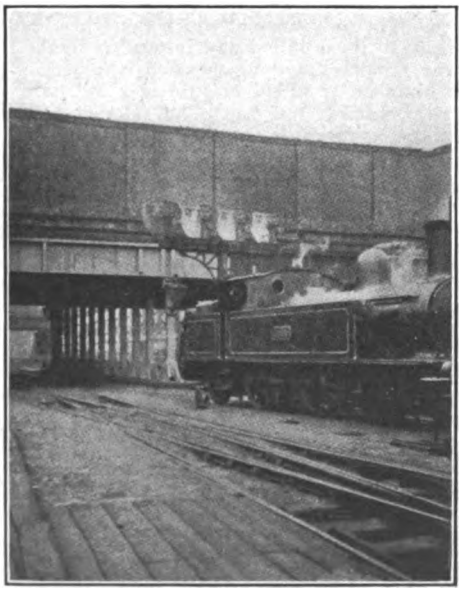
"You have no right to take chances. The other fellow may have to take the consequences."

The Illinois Central is endeavoring, in connection with its safety movement to break up the practice of its passengers of alighting from trains at points where regular stops are not made. To this end bulletins are being distributed among its passengers, which state in part that "The practice of getting on and off trains at unauthorized localities is dangerous. While you personally may be mentally and physically endowed to protect yourself from personal injury, there are others not so well equipped. They are apt to imitate you. Please use the regular station facilities."

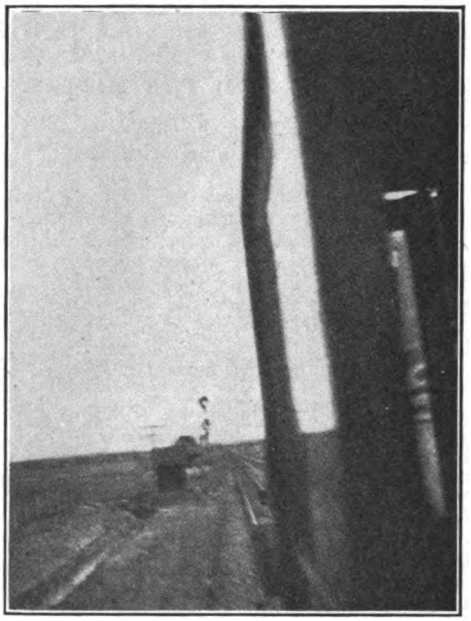
Railway Signals and Visual Requirements of Employes.

MR. NELSON M. BLACK, of Milwaukee, Wisconsin, is the author of a most interesting article appearing in *The Safety Heating and Lighting News* on the application of ophthalmology to the railway field—or, in other words, safeguards which should be taken to insure proper vision on the part of railway employes.

Dr. Black points out that with modern high speed equipment it is necessary to determine and read a signal half a mile before it is reached, in order that a train may be brought to a stop. That this is no easy task is, of course, apparent to anyone who has given it consideration, for the ordinary semaphore arm is but four feet long and six inches wide, while the roundel of the lamp at night is six inches in diameter. It requires almost perfect vision to discern signals under all sorts of weather conditions under such circumstances, even when the observer is stationary. The engineman, however, does not have the advantage which the stationary observer possesses, for he is rushing at the signal at a high rate of speed, and it is a peculiar fact, graphically illustrated in the accompanying cut, that an engine, when in motion, produces a blurring effect, even to the almost instantaneous eye of the camera. This renders the correct reading of a signal a matter of great difficulty, and when with this is combined the many other factors which handicap the engineer, such as escaping steam from injectors, leaky valves, connections, piston rods or air pumps, the dust from passing trains or highway crossings, the reflection of snow, bodies of water, green foliage, and the glare of the sun when directly ahead, it is readily seen that only those possessing the clearest sort of vision are fit for such work. At night the glare of the furnace door, the effects of opposing headlights or of arc lights in yards, upon bridges or at other points near the right of way, offer equal difficulties.



SPECIAL BACKGROUND INSTALLED ON ENGLISH RAILWAYS FOR SIGNALS WHERE NATURAL BACKGROUND IS POOR.



BLURRING EFFECT PRODUCED BY MOTION OF ENGINE WHEN TRAVELING AT A HIGH RATE OF SPEED.

Dr. Black next proceeds to analyze the advantages and disadvantages of glasses for protection to employes, and as a means of increasing their vision. The objections ordinarily stated are, that the glasses become smeared and dirty from grease and dust or smoke; that they become misty from fog, rain or snow, or when coming from the cold into the warm air of the cab; that they are dangerous through the liability of being broken; that while theoretically satisfactory in the testing room, they do not give the same clearness of vision at very long range, and finally, that from a legal aspect, in case of accident, they are disadvantageous to the railroad company. In Dr.

Digitized by Google

Black's opinion none of these objections is of grave import. When looking through dirty glasses the vision is impaired for objects at close range, but at distances of 100 feet to 1½ miles they offer little obstruction to the sight. The objection to mist is chiefly disadvantageous as regards the handling of cab mechanism by the engineman. Experience has demonstrated that the danger from a possible breakage of glasses is almost nothing.

As regards the theoretical versus practical efficiency of glasses, he concludes that while there may be some basis for this objection, yet the employe with naturally defective vision can see much clearer under service conditions with glasses than without them. Dr. Black does not agree with the objection that vision is better without correcting lenses in dusk or darkness. This phenomenon is only apparent, he says, in attempting to define details of objects which must be seen by reflected light, and does not apply to those seen by transmitted light or self-luminous objects as the case with signals.

As regards the legal objections to having enginemen wear glasses, Dr. Black quotes with approval the statement of A. E. Manchester, superintendent of motive power of the St. Paul System, that this objection can only be overcome by conventions of oculists, establishing the fact that it is better for a man to wear glasses than to have moderately deficient eyesight.

Dr. Black offered the valuable suggestion that railroads could with profit furnish backgrounds for signals likely to be misread because of bad surroundings. This policy is followed extensively by English roads and by an increasing number of American railroads.

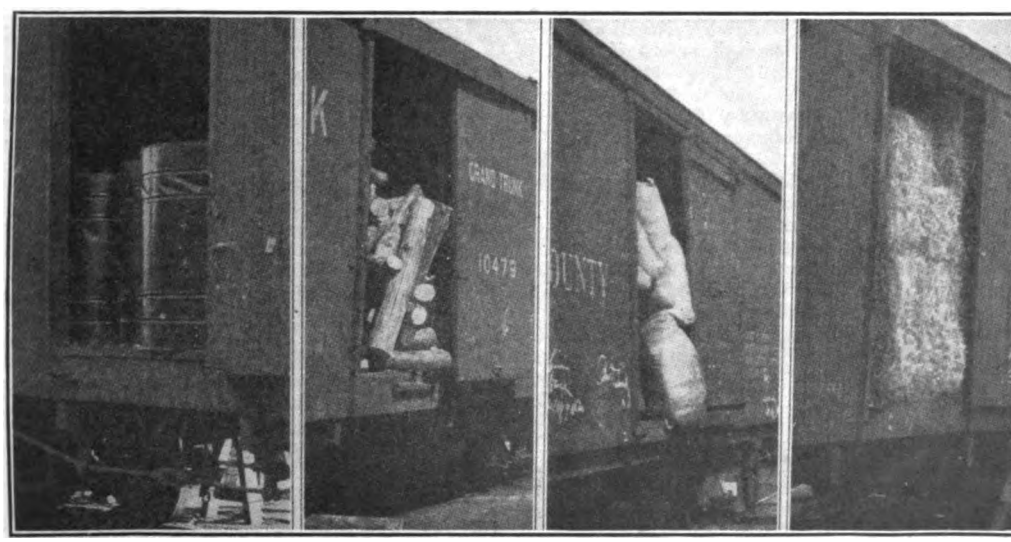
The Transfer and Adjustment of Loads.

ONE of the most interesting discussions which has recently taken place before gatherings of railway men is that which occurred at the March meeting of the Central Railway Club. The subject under consideration at this meeting was the report of the committee of the Master Car Builders' Association appointed to consider the revision of the rules of interchange. The speaker of the evening was Mr. W. H. Sitterly, the chairman of the committee.

In addition to outlining the changes recommended by the committee, which are quite lengthy, and, therefore, cannot be adequately summarized, Mr. Sitterly presented a number of illustrations, some of which are reproduced herewith, showing in a striking way the results of improper loading. The speaker stated that it was not necessary to convince railway men of the cause and effects of improper loading, and that constructive work must lie along the direction of educating shippers in the proper method of loading material both in open and closed cars. He advocated that industrial plants be furnished with a copy of the M. C. B. loading rules, and that a representative of the railroad, who was thoroughly familiar with the rules, be sent around to instruct the shipper. It was his experience that the majority of shippers welcomed co-operation of this character.

It is necessary for the railroad to see that the representative sent to instruct the shipper be thoroughly familiar with the loading rules, and has sufficient ability to meet any peculiar conditions or problems which may arise out of the shipments of each particular company. The committee found that a considerable proportion of the bad loads originated at stations where there is no inspector. In such cases the agent passes judgment on the load, and to his incomplete knowledge must be charged the resulting damage. The speaker advocated that under such conditions the agent should take the matter up with his superior, and that the company should send a car inspector, or other representative competent to handle the matter, to the point where the car is being loaded in order to instruct the shipper as to the proper method to be followed.

The committee also found that a considerable number of cars which had to be reloaded were in bad physical condition when placed upon the siding by the railroad company. In other words, they were not fit to receive the shipment. Mr. Sitterly asserted that 90 per cent of the foreign cars held in shops and transportation yards await-



FOUR EXAMPLES WHICH SHOW, IN A STRIKING MANNER, THE RESULTS OF IMPROPER LOADING.

Digitized by Google

ing disposition from the owner on account of poor physical condition, started away from the loading point in improper condition, carrying a load which was almost certain to be damaged in transit.

The Administration of the State Railways of Prussia-Hesse.

MR. WILLIAM J. CUNNINGHAM presented an unusually complete description of the administration of the state railways of Prussia-Hesse, at the meeting of the New York Railroad Club, held on Friday evening, April 18th. Every feature of organization and operation was touched upon, and the problems of the railways of that country were illustrated by numerous statistics compiled by the speaker. His auditors gained a very good impression not only of this system of railroads as a whole, but particularly of the points in which there were radical differences from our standards of construction and operation.

It was the conclusion of the speaker that it was impossible and needless for anyone to attempt to make a comparison of the freight rates, passenger rates, expenses and operating ratios of railroads of this country with those abroad, because of the great difference in operating and traffic conditions. He believed that the only question worth considering, as regards transportation, is, how well does it serve the country in which it is located. From this standpoint it was his opinion that state operation of railways in Prussia was successful, and that the railways were operated with reasonable efficiency. While Prussia has succeeded with Government ownership and operation, yet it does not follow, because of the difference in conditions, that this country would be equally successful. Mr. Cunningham declared that nowhere are conditions more ideal for Government ownership than in Prussia. The Minister of Public Works, having charge of railways, is appointed by and responsible only to the King. Changes in this office are infrequent. Civil service conditions apply throughout the system, and the employes are subject to what is approximately military discipline. It was his opinion that the administration was entirely free from graft and the evils of political partisanship.

Settlement of Controversy Concerning Cotton Shipments.

REPRESENTATIVES of the steamship companies, railroads, cotton compressers and others interested in the handling of the cotton crop effected a settlement of the long drawn out controversies concerning the conditions under which the movement of cotton shall be made, at a meeting recently held at Dallas, Texas. The resolutions representing the conclusions of this gathering provided that the standard size gin box is to be 27 inches by 54 inches; that all bales turned out in boxes of larger length or width shall be subject to an extra charge of $1 per bale on ocean freights, and that the compressers shall charge $1 a bale over the regular price for compressing bales of a larger size than that agreed upon. In addition the existing contracts between the carriers and the compress companies shall be rewritten so as to provide: "That no receipt or clearance shall be given by the compress companies as a basis for the issuance of bills of lading except for cotton or cotton linters actually in their possession for shipment; that such receipts or clearances shall show the actual condition of such cotton or cotton linters and shall indicate whether any of the following conditions are present:

"1. Not sufficiently covered. Covering insufficient to retain marks. More or less wet. More or less stained. More or less soiled.

"Negotiations to be made on the through export bills of lading, corresponding to the notations. A clean bill of lading only to be issued against clean clearances.

"2. That each bale covered by such receipts or clearance shall be compressed to a density of not less than 32½ pounds per cubic foot, and that receipts shall show any bales which cannot be so compressed.

"3. That such receipts or clearances shall show the number of bands on each bale.

"Such contracts to provide that the compress company will not issue clean clearances for account of any shipper with whom they have not made satisfactory arrangements for the reconditioning of the cotton. In the event of its joint inspection, prior to loading such cotton is found not to conform to the clearances for account of any shipper, contract further to contain a provision for the employment of joint inspectors to the time it is compressed or loaded, for the purpose of determining the true condition of the cotton and keeping records for use in connection with any claim that may subsequently be filed.

"Any cotton for which clean bills of lading have been issued shall not be loaded by the compress company into railroad cars until such cotton as may have been damaged in the interim has been conditioned to comply with the through bill of lading. It is further agreed that if for any cause it should be necessary to load upon the cars cotton which has been damaged while waiting shipment and after the signing of the clean through bill of lading it is thereby agreed that the railroad interested will furnish in confidence to the ship agent concerned a copy of such exceptions."

Northwestern Plans Freight Loss Campaign.

THE freight traffic department of the Chicago and North-Western is giving unusually close attention to the question of how the enormous loss and damage claims for injury to freight, paid by this company as well as all others, may be reduced. This company has compiled statistics showing that while during the last year less than carload freight tonnage was only 5.7 per cent of the total tonnage, and the revenue accruing from it 21.5 per cent of the aggregate, the loss and damage arising from this class of freight was 53.7 per cent of the whole. Looking at the matter from another way, on carload freight, only 1 per cent of the revenue derived was paid out for damages, while .4 per cent was returned on less than carload shipments. The North-Western has urged upon its employes to use intelligent efforts to reduce the losses in every way possible, pointing out that under the common law, a common carrier is an absolute insurer for freight accepted by it. Its liability for goods is even greater than for passengers, for there is no such thing as contributory negligence in the case of freight.

Digitized by Google

For the guidance of its employes in bringing about the desired result, the railroad company offers a number of suggestions, among which are that: "No shipment should be accepted that is not legibly and distinctly marked, because many of the claims grow out of careless marking; no shipment should be received that is not properly packed; all merchandise tendered in a defective or insecure container should be refused until such condition is remedied; great care should be given to loading less than carload freight in the car, and in handling goods from the freight house to the car and vice versa."

Railroads Dissolve "Military Pool."

LEARNING that the arrangement known as the "Military Pool" operated among railroads westward from Chicago, would be attacked by the Federal Government as a combination in restraint of trade, it has been decided to abolish this agreement. The pool was established several years ago, and provides in effect that all lines subscribing to the organization should participate in the transportation of Federal troops in rotation. Whenever a railroad was next in line it would submit a bid to the Government which was lower than that submitted by the other roads nominally competing. Some time ago the Southern Pacific, Western Pacific and Santa Fe announced they did not care to continue their membership. This action presaged the breaking up of the pool, which has now been definitely accomplished.

Increased Efficiency in Freight Car Movement.

ACCORDING to the statistics compiled by the American Railway Association on the performance of the freight cars of the country during December, 1912, there has been a marked increase in the efficiency of car movements over the corresponding period of the previous year. During December, 1912, the average movement during the month was 396 ton-miles per day, as against 361 ton-miles a day in the previous year. This increase in car movement is to be explained partly by the open winter, which greatly facilitated railway operation. In spite of this advantage, however, the results are most encouraging, as showing increased efficiency in operation.

The latest report of the Association covering the car supply shows that on April 15th, of the present year, there was a net surplus of 57,498 cars as compared with 79,389, on April 11, 1912. This, on its face, indicated a better traffic condition than existed a year ago, but shows a slight increase in the net surplus as compared with April 1st of the present year. This increase was greatest in coal cars, the box and flat car surplus showing a slight decline.

The Accident Roll.

IT is gratifying to be able to record that the number of serious accidents occurring during the month has been unusually small. The most serious accident was that which occurred on the Western Maryland on April 5th, due to a train running into a landslide at Tonoloway, Maryland. At the time of the accident President J. M. Fitzgerald and other executive officers of the road were aboard the train, but none was injured, although the front end of Mr. Fitzgerald's private car was smashed. The engine turned over on its side, and the three coaches which comprised the train were derailed. None was killed, although a number were more or less seriously injured.

Another accident during the month occurred on the Cleveland Terminal Valley Division of the Baltimore and Ohio, near Magnolia Station, 15 miles south of Canton. Due to defective track conditions, a car was derailed, 8 persons being injured, 2 of them seriously.

The report of the Georgia State Railroad Commission for the year 1912 shows an increase of 100 per cent in the number of employes of steam railroads killed in Georgia in that year as compared with 1911. On the electric roads of the state not a single passenger or employe was killed during 1912.

Pennsylvania Establishes Employes' Health Rule.

CONSIDERABLE attention has been attracted to the rule recently established by the Pennsylvania Railroad debarring from employment in its dining car and restaurant department any person who shows even a tendency toward a communicable disease. A quarterly physical examination of every employe having anything to do with the preparation or serving of food is to be inaugurated. Those who show any disease or a tendency thereto are to be laid off until they can exhibit a "certificate of ability" from one of the company's doctors. The order has been issued for the purpose of promoting public health.

Alton and Santa Fe to Pipe Oil over Mountain.

THE Santa Fe System has awarded a contract to the General Petroleum Company, of San Francisco for the transportation of its fuel oil by a pipe line from the Kern fields over the Tahachapi Mountains to Mojave. The petroleum company has also entered into a contract with the Southern Pacific for a similar purpose. From the two contracts the petroleum company will receive a rental of approximately one million dollars a year. The closing of these contracts has eliminated the necessity for the construction of a pipe line by each of these companies, and enables them to devote from 250 to 400 tank cars to commercial use instead of using them in railroad service. The greatest advantage accruing to the companies, however, is in the decreased cost of fuel oil to them at the point of consumption.

Mr. George H. Baker, recently appointed fuel director of the Alton system, is making a special effort to lessen the waste of coal. He has requested engineers to aid firemen in boiler feeding, and steps are being devised to train firemen in better methods of work, looking towards an avoidance of waste.

Remarkable Locomotive Performance.

ANNOUNCEMENT has been made by the Virginia Railway of some remarkable locomotive performances on that line. The record was made with a 2-8-8-2 articulate locomotive on that portion of the line between Elmore and Clark's Gas, on the Deep Water division, for

Digitized by Google

a distance of about 14 miles, nearly all of which is on a grade of 1 in 45, with a maximum compensated curvature of 12 degrees. Over this grade, with one light Mallet as a leader and two of the articulated engines as above described as helpers—the tractive power of the three locomotives combined being about 332,000 pounds—a train load of 4,230 tons has been hauled.

Ban on Unnecessary Whistling.

ORDERS have been issued by the various railroads entering Chicago designed to prevent unnecessary whistling within the city limits. Employes are instructed to avoid all unnecessary whistling, and where whistling is necessary, the blasts should be as short as is practicable, and care should be taken to make them distinct, or properly spaced. This order follows the practice heretofore inaugurated by the Illinois Central of prohibiting the indiscriminate ringing of locomotive bells at stations.

Southern Pacific Inaugurates "Supply Train."

THE Southern Pacific System has put into operation a supply train of about 20 cars which makes regular trips over each line in its territory every thirty days. Stops are made at all section houses, construction gang headquarters, etc., and upon requisition, supplies of all kinds are unloaded. At the same time the train picks up all waste and scrap material which has accumulated during the interval, taking it back to headquarters. The train is in charge of a division officer to check up requisitions and the supplies as issued. It is believed that the train will work considerable economy in the cost of distributing supplies, and will be particularly advantageous in reclaiming scrap and waste.

Frisco Method to Avoid Waste.

MR. W. C. NIXON, vice-president of the St. Louis and San Francisco Railroad, has issued an appeal to his employes to avoid waste. If each employe engaged in maintenance of equipment and transportation work would save an average of even five cents a day for the company by preventing the waste or misuse of little articles, the total saving in one year would be nearly $400,000 on this system. Mr. Nixon points out that the prosperity of railroad employes is dependent upon the prosperity of the railroad, and that this saving, if it could be effected, would have a material bearing upon the amount of wages which the road could afford to pay.

New Developments in Signals and Dispatching.

PRESIDENT FINLEY, of the Southern Railway Company, announces that work will be commenced at an early date on the installation of automatic electric block signals on the line between the Alexandria Terminals and Orange, Va., a distance of 78 miles. When this work is completed, the Southern Railway will have its entire line from Washington, D. C., to Orange Va., protected by automatic block signals.

The New York, New Haven and Hartford is perfecting arrangements to comply with the recommendation recently made by the Public Service Commission for the reconstruction of its signal system on the line between Springfield and New Haven. It is planned to install a new signal system on the lines in both Massachusetts and Connecticut. New signals are to be similar to those now in use on the line between Hartford and Waterbury, displacing the old "banjo" signals now in use.

The Burlington System, after two years of experience in telephone dispatching on the line between Hannibal and St. Louis, has announced that on June 1st all trains between St. Louis and Burlington will be dispatched by this method. The new change means that the old method of dispatching by telegraph is to be superseded in favor of the more modern method.

In this connection it is interesting to note that the Missouri Pacific-Iron Mountain System is now using the telephone method of train dispatching with apparent success over a wide area. The entire Illinois division from Dubuque to Cairo and Illmo, and branch lines reaching to the Illinois coal fields; on the Eastern division from St. Louis to Jefferson City; the Central Kansas division from St. Louis to Jefferson City, and from Kansas City to Hoisington, the Omaha division from Kansas City to Falls City and that portion of the Arkansas division from Little Rock to Texarkana, is now being operated in this manner. In all a total of 822 miles of line with 148 stations are equipped for telephone dispatching.

The Alton is about to experiment with the plan introduced by the Union Pacific some years ago of having signal systems looked after by the section foreman. The Alton has selected a stretch of 40 miles, between Bloomington and Odell, for the experiment. The two signal maintainers heretofore employed are to be dispensed with. The foreman is to receive an advance of $10 per month to compensate him for the additional work and responsibility, and is to be held responsible for the maintenance of the signals in his section. It is believed this will effect a large economy, and will, moreover, enable the railroads to get a higher grade of men for section foremen because of the increased compensation which they can afford to pay.

Grand Trunk Offers to Give Line to Rhode Island.

PRESIDENT CHAMBERLIN, of the Grand Trunk Railway, has written to the Governor of Rhode Island offering to make an inalienable gift of the incompleted road, representing an expenditure to date of two and a half million dollars, to the state of Rhode Island on condition that the state shall complete the road and operate the line in one of two ways, as follows: "First, if the state desires to operate the railroad we will grant running rights on reasonable terms over our lines, so as to make the line sufficiently long to constitute an operating division; and we will also make a traffic agreement for a division for through rates on a mileage basis; or,

"Second. We will lease the state-owned railroad for a rental equivalent to 5 per cent on the actual cost to the state of completing the whole line."

If the state is unwilling to accept this offer he asks its consideration of his previous proposition, to have the state guarantee the amount of bonds necessary to finance the completion of the line. If neither of these propositions is acceptable to the state the Grand Trunk will abandon the line and drop the project.

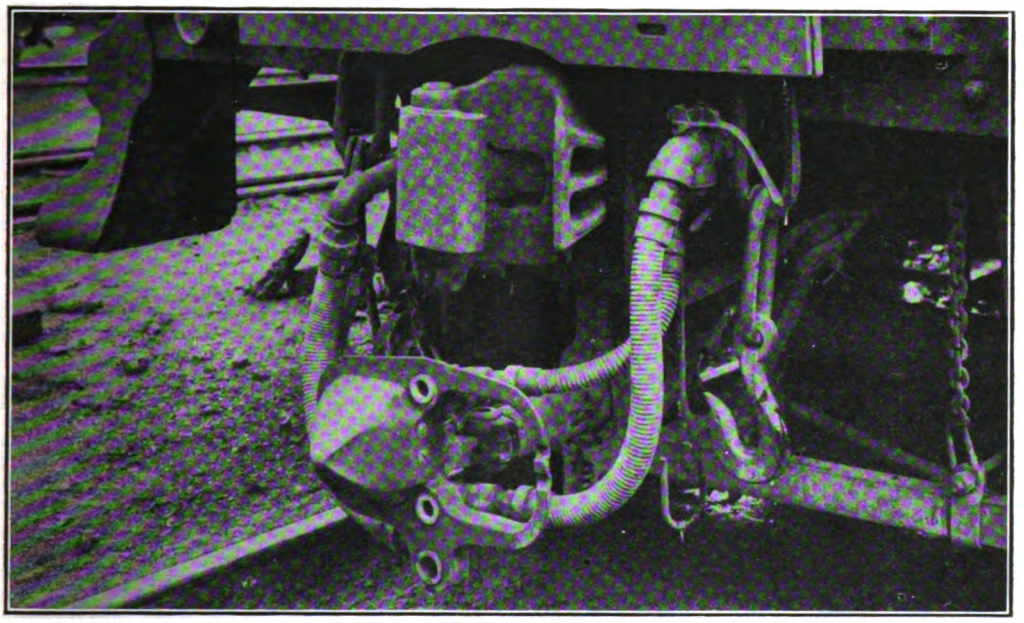
Mechanical

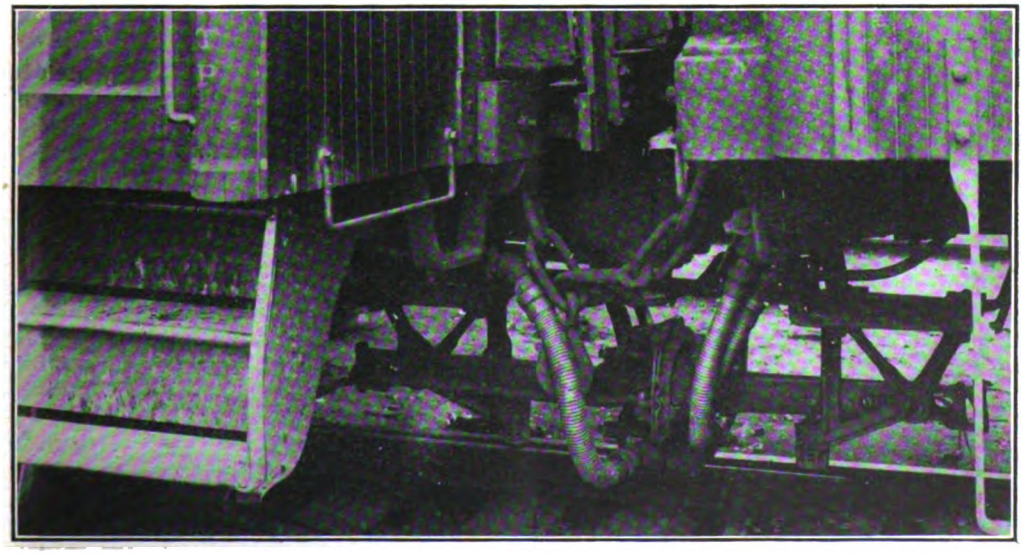
AUTOMATIC TRAIN TELEPHONE COUPLER

ONE of the latest inventions designed to prevent accidents to trainmen, is the automatic train pipe connector, manufactured by the Durbin Automatic Train Pipe Connector Company of St. Louis. This connector couples air, steam, signal line and telephone line automatically, and has been regularly employed on one of the trains of the Queen and Crescent Route, operating between Cincinnati, Ohio, and Danville, Kentucky, since March 5th. In the opinion of the general manager of that road it has, so far, proved satisfactory.

This device, as the accompanying illustrations indicate, is a butt faced type and is suspended from the car by carrying irons independent of the drawbar. The face of the connector when uncoupled extends 3½ inches beyond the inside face of the car coupler knuckle, and is pivoted to a



THE DURBIN AUTOMATIC TRAIN PIPE CONNECTOR.



SHOWING THE DURBIN AUTOMATIC TRAIN PIPE CONNECTOR IN OPERATION BETWEEN CARS.

Digitized by Google

main shaft containing a vanadium compression spring 2½ inches in diameter. When the connectors are coupled the compression on the face is eleven hundred pounds. In addition to this there is a positive lock on either side of the connector head which automatically locks and unlocks the heads. The gathering range of the connector head is 6 inches vertically and 6½ inches laterally. The vertical movement of the connector when coupled is 10 inches. The curvature allowed for is practically unlimited, and the connector will couple and register when drawbars slip by. The device clears the rail 7 inches and the drawbar 5 inches. Gaskets can be removed and replaced without the separation of cars. The nipples are held in place by a clamp and in order to remove them it is only necessary to loosen a nut on the back of the connector head, which allows the clamp to be turned to one side.

A telephone connection is made automatically by two contact posts which are situated on the inner face of the connector head.

The weight of the connector is one hundred and forty pounds, and it is made of malleable iron. Its employment obviates the necessity of trainmen crawling under cars to make connections for either steam, air or telephone.

By its use the engineer, by simply pushing an electric button on his telephone, may signal to the conductor, brakeman or baggagemaster, as he may desire and a bell rings in each coach, while any member of the train crew can call the engineer by the same process.

THE MINE RESCUE CAR OF THE LEHIGH VALLEY COAL COMPANY

THE mine rescue car, which has been in course of construction at the Lehigh Coal Company's shops at Drifton, has now been completed and is fully equipped. Nothing has been omitted in the final arrangements which will contribute to the safety or comfort of the sufferers from any possible mine accident.

Rescue outfits have been kept for the last half dozen years at four central points in the company's collieries, and the mine rescue car is to be maintained ready to be rushed on call to any point in addition to these previous provisions.

The car is a former combination baggage and smoking car converted for its present use. The side doors of the forward half, or former baggage part of the car, have been left as they were, and especially prepared flights of steps are carried beneath the car in order to facilitate the transportation of any injured mine worker in through the broad doors. The forward compartment, to which easy access is thus gained, contains the operating table, surgical instruments, lockers for the men's clothes, water coolers, and the first aid supplies consisting of splints, bandages, absorbent cotton, Red Cross towels, Bellevue gauze, adhesive plaster, picric acid gauze for burns, germicidal soap, tourniquets and aromatic spirits of ammonia. Hospital authorities were consulted and passed on every point from the height of the operating table to the medical supplies.

In this compartment there are also six regular United States Army stretchers in overhead racks, a dozen rubber blankets and twice as many woolen ones. Here also are the fifteen big oxygen tanks, held in racks along the wall, and the pump for charging the Draeger Oxygen Helmets, a dozen of which line the wall at the forward end of the compartment. These hang above the low lockers in which the stores are kept, and which are so constructed that a cot arrangement which will accommodate four men can be placed on top of them. Rows of spare potash cartridges, two hundred in number, and of small oxygen tanks to be used with the Draeger helmets, kept in racks around the ceiling, pulmotors, inhalators, and tools for any kind of inside work,—saws, axes,

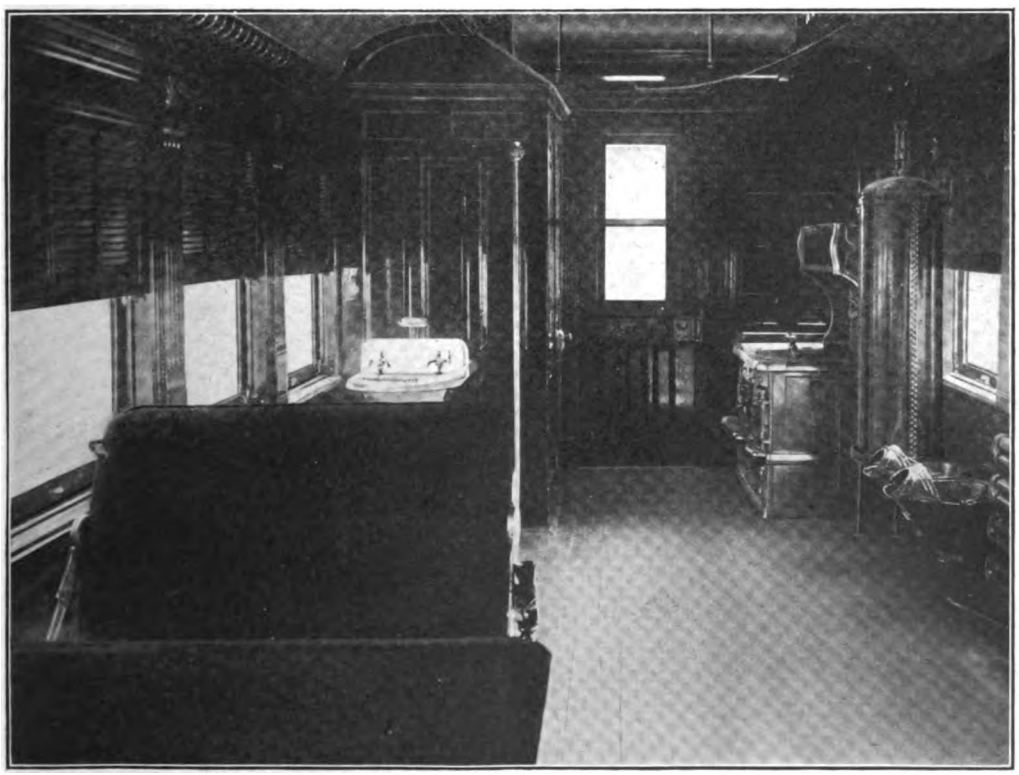
hatchets, picks and hand drills for mining, ventilation and timbering,—complete the necessary equipment. Every inch of the car is kept immaculately clean with the cleanliness of a hospital.

The latter half of the car contains a stove for cooking, shelves and a sink, tables which can be stowed away in an overhead rack, and two facing seats which can be converted into a bed. The water supply is carried in an overhead tank, and both hot and cold water are at all times available.



KITCHEN END OF CAR WITH OVERHEAD WATER TANKS. SEAT IN FOREGROUND CAN BE MADE INTO BED.

Digitized by Google

The car is heated by steam, so arranged that a steam hose can be run to it from any colliery, and the radiators have ample heating surface so as to insure comfort for its occupants in any weather. It carries two fire extinguishers to protect the car itself from fire, and two larger extinguishers to be carried into the mines.

The car can accommodate fifteen men, and while primarily designed for actual rescue work, it is never idle, as it is also used as a demonstration and instruction room for teaching the men at the various collieries this most important work. It is in charge of the Rescue Foreman, and the men to receive instruction are selected by the mine foreman, but the company issues a certificate to them when they are sufficiently expert, and this may be withheld if they do not qualify.

AUTOMOBILE SHIPPING PLATFORMS

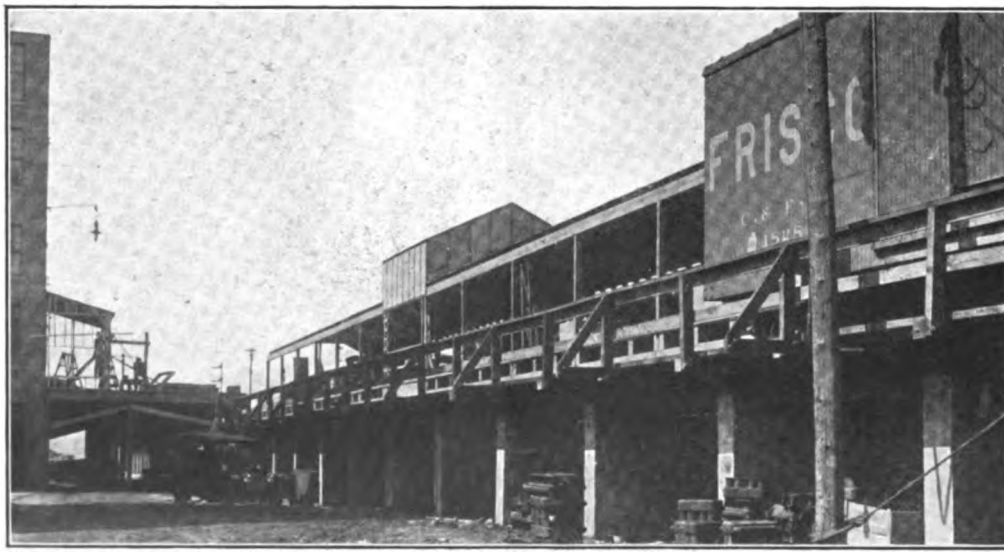
TEN years ago it was an easy matter for the railroads to handle the automobile shipments from Detroit, by diverting a few furniture cars from Grand Rapids or some other Michigan town. This condition no longer prevails. All the trunk lines have been forced to invest heavily in special rolling stock to handle the 300,000 or so new cars which are shipped annually. Solid trains of these automobile cars are of frequent occurrence in all long hauls, and the problem of the railroads to provide these cars has grown to be one of the live issues in traffic.

In the spring of 1912, the Detroit manufacturers were forced to store thousands of cars, on account of the overwhelming demand for transportation facilities. Every warehouse in the city was filled and several factories were forced to use circus tents. Police were called out to quell disturbances caused in the yards when gangs from rival factories fought over box cars. The lesson of last spring resulted in further investments in rolling stock by the big roads. In the meantime, wise traffic managers spent days in missionary work among the manufacturers, preaching the need of co-operation in loading facilities.

The Studebaker Corporation, appreciating the necessity for better loading facilities, has had constructed the automobile loading platform shown in the accompanying illustrations. By its use during the past two months 200 cars a day of the three Studebaker types have often been loaded. Another advantage is the speed with which other supplies are handled. One of the elevators connects with the warehouse where parts, advertising literature and miscellaneous shipments are boxed and placed on small trucks. The trucks are elevated to the platform from which access is easy to any car on either side of the long aisle.

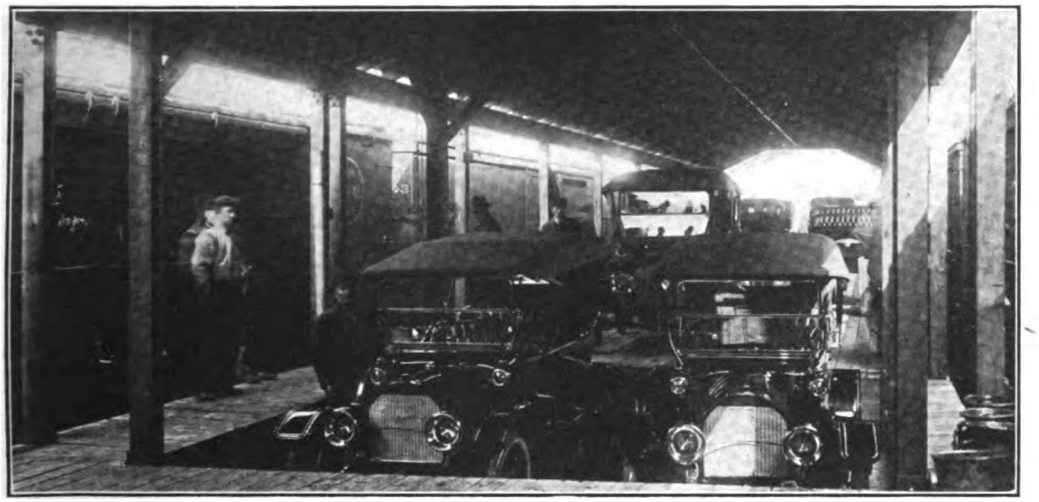
A further novelty is a rolling bridge which crosses the inner siding where it connects with the main line. Actuated by an electric motor, this bridge can be removed to allow switching. The platform proper is lighted and roofed, permitting work in all sorts of weather. The manufacturers regard their investment of $60,000 in loading facilities as one which is already paying.

In the construction of the platform the fact that the main line tracks back of the plants are fully twenty feet above the level of the factory yard, due to a separation of grades at three streets, had to be given due consideration. Formerly completed cars had been driven uo an inclined plane, under their own power. The new plan boldly abandoned this idea, extending the main line tracks at their grade, in the form of a massive, cement-supported shelf that projected over the factory yard, for two city blocks. The new loading platform was placed between two sidings and was pierced for two elevators, one in each city block.



STUDEBAKER SHIPPING PLATFORM. THE SPACE BELOW THE SHELF CAN BE USED FOR THE STORAGE OF A LARGE NUMBER OF FINISHED AUTOMOBILES.

Digitized by Google

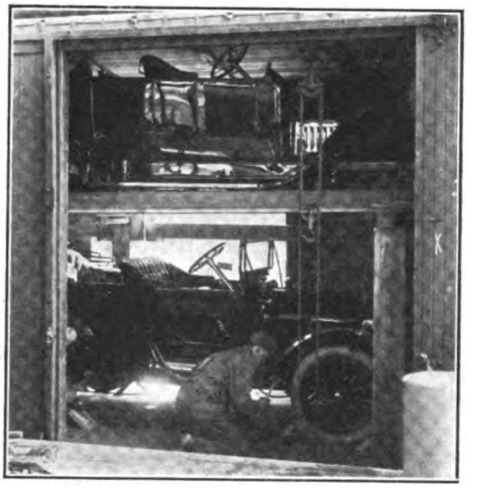


ONE OF THE TWO HYDRAULIC ELEVATORS USED BY THE STUDEBAKER CORPORATION FOR COMMUNICATION BETWEEN FACTORY YARD AND THE SHIPPING PLATFORM, MAKING ENTRANCE TO THE PLATFORM POSSIBLE, REGARDLESS OF THE NUMBER OF FREIGHT CARS ON THE SIDING.

Completed cars are driven to the elevators, two at a time, and lifted to the platform, the floor of which is level with that of the standard automobile car. Day and night loading by a large crew permits quick work, even when cars are double-decked for long shipments. Two trains can be loaded at once, one on either side of the platform, thus simplifying switching operations. Entrance being from below, is always possible, regardless of the position of cars on the siding.

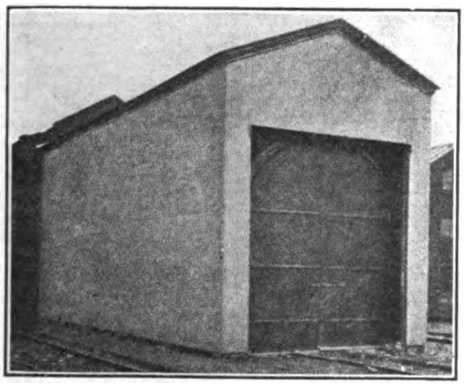
The company's traffic manager says that the advantages of the platform, direct and indirect, have been fully up to expectations. He says:

"We have found our new facilities to be every bit as advantageous as we had hoped, so far as promptness and convenience are concerned. But the most helpful feature is the pleasant relation it has cemented with the railroads. They have lost no opportunity to show how they appreciate our efforts toward added freight car efficiency. There is sometimes a tendency for the manufacturer and the railroad to work at cross purposes. We have found that the ideal situation is one in which shipper and the railroads work in harmony, anticipating each other's wants and spending money, when needed, to smooth out the rough spots."



DOUBLE-DECKING A CARLOAD OF AUTOMOBILES.

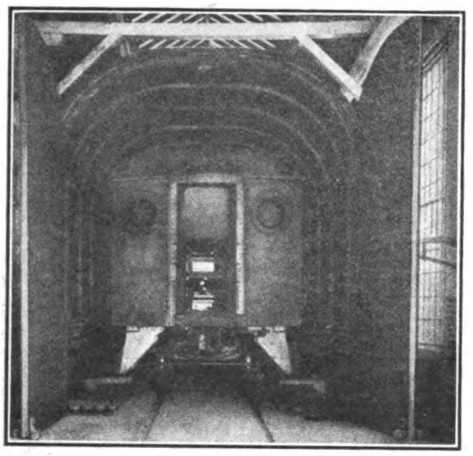
PAINTING STEEL CARS



EXTERIOR OF OVEN USED FOR BAKING PAINT ON STEEL CARS.

AT a meeting of the American Society of Mechanical Engineers of New York, held on April 8th, Mr. C. D. Young, engineer of tests of the Pennsylvania Railroad, described in detail the process of baking enamel paint, which had been worked out at the Altoona shops of his company. This process is almost identical with that followed by the Hudson and Manhattan Railroad, the chief difference being that the Pennsylvania bakes both the exterior and interior of the car, and that it uses steam heat instead of electric heat, as does the Hudson and Manhattan. The difficulty with artificial driers and gums, according to Mr. Young, is that while they hasten the time of drying and hardening, they continue this process after the desired point has been reached, thus giving the varnish unnecessary hardness and brittleness. This results in cracking and checking, the destruction of the surface being hastened by the unequal expansion and contraction of the metal surface as compared with wood; the

Digitized by Google



STEEL CAR AND OVEN.

linear expansion of steel being more than twice that of wood. The steel cars show interior varnish cracks and checks, in many cases, after four months of use. About 80 per cent of the cars of the Pennsylvania, after from four to eight months' use, showed serious interior varnish cracks, while the proportion of serious exterior cracks was only 6 per cent.

After a series of experiments made by painting a number of panels and baking them in a heated oven, it was found that artificial driers could be almost entirely eliminated, and that elastic varnish could be used on the exterior of the cars which, after being dried in the oven, was much superior under service conditions.

After these experiments had been completed, an oven was designed and built, the general nature of which is shown in the accompanying illustrations. It is 90 feet 3 inches long, 13 feet wide and 15 feet high. At each end are large doors through which the car can be moved. The oven is lined on the inside with steel plate, between which and the outer shell is a three-inch space filled with magnesia lining. The interior of the oven is lined with 16 rows of 1½ inch steam pipes, giving over 2,000 square feet of heating surface, and making possible a temperature over 250 degrees F.

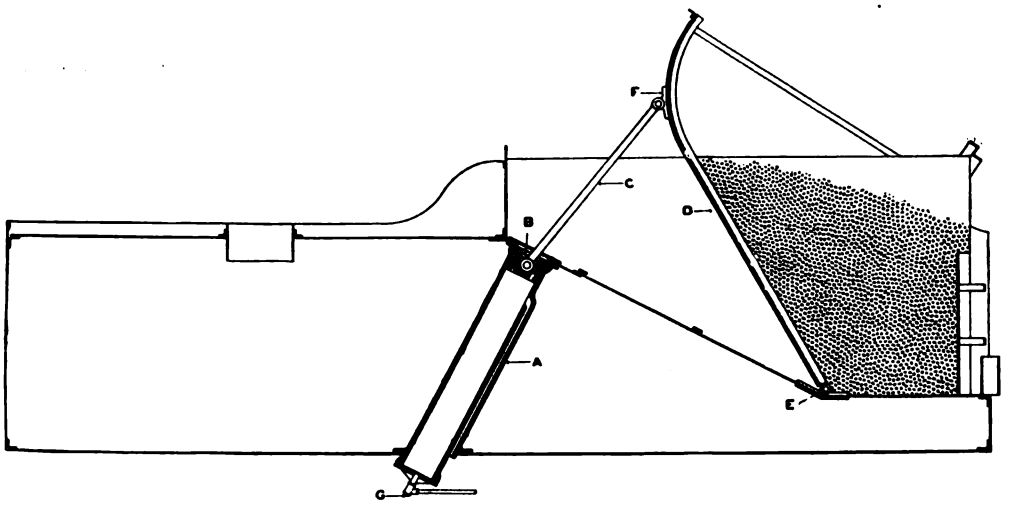
After the car has received these several coats of paint, including lettering, striping, etc., three coats of high grade finishing varnish, especially adapted for the baking process, are applied. Each coat of varnish is baked at a temperature of 120 degrees to 150 degreees, for a period of three hours, after which the interior of the surface is rubbed down with pumice stone and oil, giving the desired "flat-finish."

It is believed that this process will practically eliminate check cracking, increase the life of the paint, and hence decrease maintenance costs.

AN INTERESTING MECHANICAL COAL PASSER

A PATENT has recently been issued upon a most interesting device intending to solve in part the problem of firing the huge locomotives now demanded by operating conditions. The Ryan-Galloway mechanical coal passer, the general nature of which can be seen from the accompanying illustration, is intended to reduce the amount of labor required of the fireman in firing that portion of the fuel supply located in the back end of the tender. This portion of the supply must be carried a considerable distance, in the case of a large sized tender, before it can be thrown into the firebox. This greatly increases the work of the fireman at a time when he is naturally more or less exhausted, towards the end of his run. The essential feature of the coal passer is a tilting hopper, which is raised or lowered through a plunger, operated either with steam or compressed air.

One of the features claimed for this device is



THE RYAN-GALLOWAY MECHANICAL COAL PASSER, SHOWING THE TILTING HOPPER RAISED AS IN OPERATION.

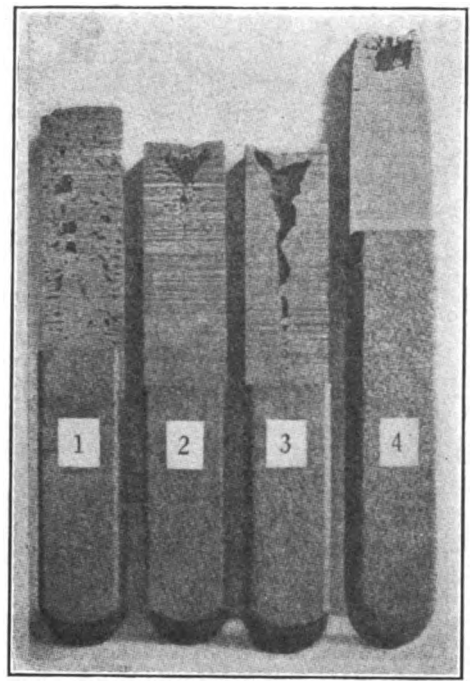
Digitized by Google

that it mixes the slack with the coal, allowing it to be burned in proportionate amounts throughout the run, rather than, as is now the case, having it all remain towards the end of the run, thereby greatly reducing the steaming ability of the engine at this time.

METHOD OF ELIMINATING RAIL FLAWS.

MANY engineers and steel manufacturers are keenly interested in the proposal of Sir Robert Hadfield, the famous English metallurgist, of a new method of casting steel ingots, which will eliminate the piping and air holes, now generally regarded as being responsible for most of the defects in steel rails. The new process by which this is to be accomplished, as described by Mr. A. Troller in *La Nature* (Paris), aims to assure the progressive solidification of the ingot by horizontal layers from the bottom upward, keeping the upper part in the liquid state as long as possible, so as to enable occluded gases to escape and impurities to collect at the top.

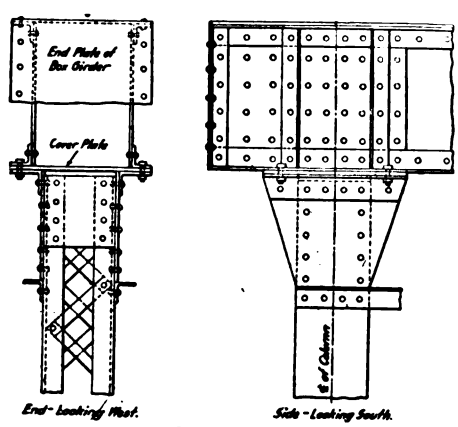
We reproduce illustrations of a number of ingots claimed to show the advantages of this process. It will be seen that while in the old ingots blow holes and imperfections are apparent almost throughout the entire upper half of the ingot, in the Hadfield ingot a very small percentage at the top is thus affected. The distinctive feature of the new process is a change in the ingot mould described by Mr. Troller as follows: "It bears a movable upper piece, furnished with a lining of refractory sand. The metal having been poured rapidly and the proper amount of aluminum having been added, there is placed on the upper surface of the molten metal a thin layer of cinders topped with a layer of coal. Compressed air is blown on the coal, which burns brightly, and thus keeps the head of the ingot at a good heat during a sufficient time."



COMPARISON OF OLD AND NEW PROCESS IN STEEL INGOT MANUFACTURE. 1-2-3, OLD STEEL INGOTS; 4, HADFIELD INGOT.

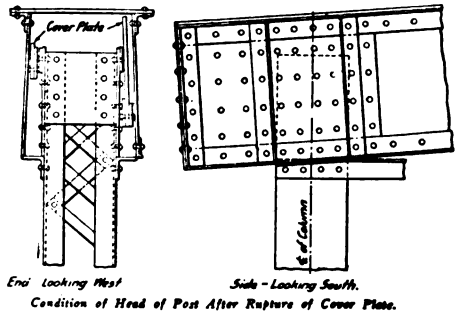
REPORT OF GLEN LOCH DERAILMENT.

CHIEF INSPECTOR H. W. BELNAP and Engineer James E. Howard have submitted their report to the Interstate Commerce Commission upon the wreck which occurred at Glen Loch, Pa., on the Pennsylvania Railroad, on November 27th, last. The main features of this wreck were reported in the "Railway WORLD for January. Mr. Howard, in his report, states that the initial line of rupture in the bridge appears to have been the completion of a fracture which existed prior to the accident. In the cover plate of one of the columns carrying the bridge the initial fracture extended from the outer surface downward to a depth about 5/8 inch, leaving about 1/8 inch sound metal. The failure to discover this fracture, which developed slowly, and the fact that the successive pounding of passing trains, coupled with the tangenital thrust the bridge being on a curve—made it inevitable that a complete fracture would result. The period of time during which the fracture was developing was a matter of inference; it may have been coming on for years, although it is certain that it has developed since the bridge was last painted, four years ago. The report states that on this division of the Pennsylvania there are from 500 to 600 bridges to be inspected monthly, and the force doing this work consists of six inspectors. It appears that the master carpenter, who has charge of the inspectors, knew, prior to the accident, that some of the angle bolts of the main girder were disturbed, and that he and the track foreman were of the opinion that the bolts in the east end of the plate girders were broken off down in the stonework of the abutment. The report finds that "The design of the bridge prevented disclosure of the fracture 'under the usual inspection.' It was inaccessible



Structure as Built.

Digitized by Google



Condition of Head of Post After Rupture of Cover Plate.

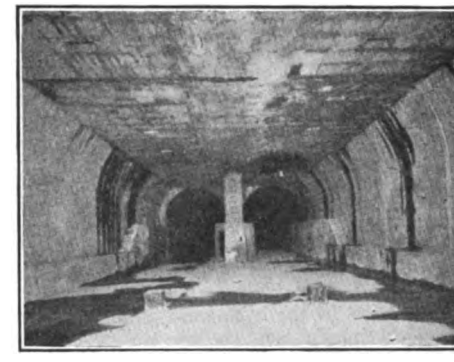
but in a comparative sense only, that is, as respecting the usual inspection. The cover plate was a short one and easily reached for painting. The double latticing of the box girder prevented direct visual inspection of the plate along its most strained section, which part otherwise was exposed to full view.

"Portable apparatus for the inspection of inaccessible surfaces has been in use for many years in other lines of inspection service, consisting merely of a mirror, with a lamp for illumination. It would doubtless be an innovation to introduce such an apparatus in bridge inspection, but in a case like the present one it is a question whether the most vital part of the structure shall go uninspected because the inspector cannot get his head into position to view the critical part or to employ the necessary means to view the same. Vital parts, demanding careful inspection, should be pointed out to the bridge inspectors by the bridge engineers, since the latter have the plans at hand and opportunity to judge by computation what parts are most strained, according to the design of the structure."

OPERATING RESULTS WITH FINISHED TUNNELS IN NEW YORK.

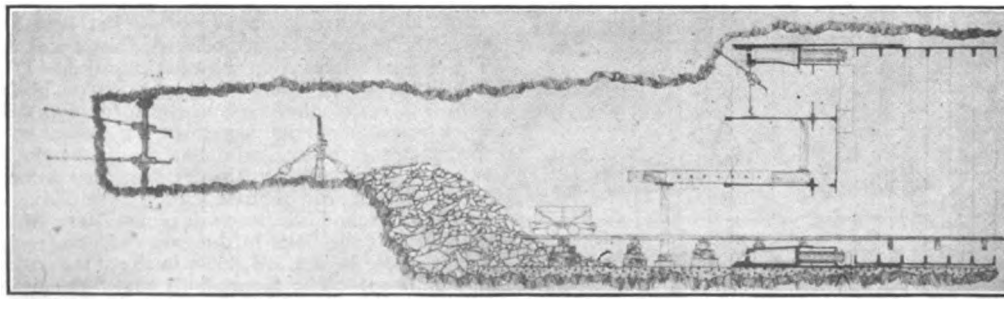
MR. ALFRED NOBLE, the eminent consulting engineer of New York City, recognized the world over as one of the leading authorities on the question of tunnels and tunnel construction, read a most complete paper before a recent meeting of the Franklin Institute on "The Railway Tunnels of New York City." This paper is printed in full in the journal of that Institute for April, 1913, and constitutes a most important contribution to the literature on the construction of large tunnels. The various engineering questions, which have to be solved in such work, the evolution of the present-day methods of tunnel construction, and the interesting and instructive features of the work of construction of the various large tunnel enterprises were reviewed by Mr. Noble. He illustrated his discourse with numerous diagrams and illustrations, showing the work of construction and the interior of various tunnels which have heretofore been built. Mr. Noble's article covers, in a large degree, ground which has been heretofore described in detail with the progress of such work.

An interesting feature of the article, however, which has not heretofore been printed, concerns the operating results which have been secured by the Pennsylvania Railroad with their New York tunnels. Mr. Noble states that the castiron lining of the tunnel is not perfectly waterproof, but while not absolutely water tight, the leakage is insignificant. A sump of some form is provided



VIEW IN THREE-TRACK TUNNEL.

at the lowest point of each tunnel or pair of tunnels, and pumped out when necessary by pumps regularly installed. "The daily leakage into the 5½ miles of river tunnels of the Pennsylvania Railroad is 2,300 gallons. The magnitude of this will be better appreciated by stating that it amounts to one drop per lineal foot of tunnel every 17 seconds, or by stating that the entire amount of leakage in one day would be removed in one or two minutes by a pump of the capacity ordinarily used by contractors of foundries. The



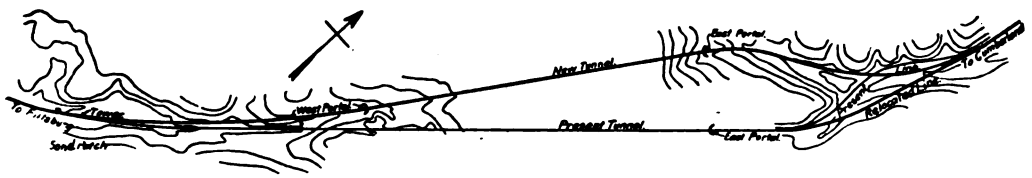
PENNSYLVANIA RAILROAD'S EAST RIVER TUNNEL. METHOD OF TUNNELING IN ROCK.

Digitized by Google

pumps provided at the new dry dock at the Brooklyn Navy Yard would remove the day's leakage in about two seconds."

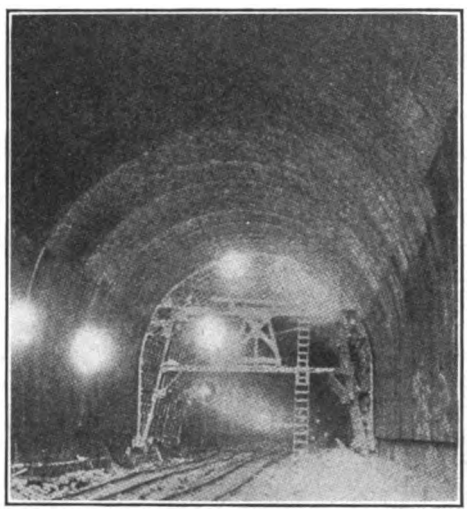
While provision was made for artificial ventilation of the Pennsylvania tunnels when they were constructed, Mr. Noble states that it has been found in practice that these ventilators are not necessary. Experience has shown that the movement of trains, forcing the air ahead, causes an entire change of air within a short time. The fans, therefore, have no value other than for emergency use, as, for example, in case there should be a fire in the tunnel, when they might be used to remove smoke, and facilitate the escape of passengers. Such a contingency, however, is most remote.

COMPLETION OF IMPORTANT TUNNEL BY BALTIMORE AND OHIO.



Alinement of New and Old Tunnels.

THE Baltimore and Ohio has completed the construction of a new tunnel at Sand Patch, Pa., on the Connellsville division. This tunnel, which is about 4,000 feet in length, is designed for double track operation, and parallels the present single track tunnel. Sand Patch is the summit of the Baltimore and Ohio lines in crossing the Allegheny Mountains. The approach from either side is by heavy grades—1.5 per cent from the east and 1 per cent from the west—which when combined with the single track tunnel, made very difficult operating conditions. For some time the old tunnel has been gradually disintegrating, requiring the introduction of wooden under-timbers to hold it up, except in the comparatively small section which was lined. This, together with the poor ventilation, made it impossible to use pushers with heavy freight trains. Accordingly, in 1911 plans were adopted for the construction of a new double track line, 11,000 feet in length, upon the north side of the present track, in which would be located a 4,000-foot tunnel. The maximum grade on the new line is 1.5 per cent on the east approach to the tunnel, although through the tunnel the grade is only .05 per cent, making unnecessary pusher service through the tunnel. Because there has been no reduction in grade, it follows that no increased tonnage capacity over this division can be expected. The accompanying illustrations show something of the magnitude of the work of construction, and the interior of the tunnel when practically completed.



INSIDE OF NEW BALTIMORE AND OHIO TUNNEL, SHOWING BRICK FACING OVER CROWN OF ARCH.

REPORT OF COMMITTEE ON SIGNALS AND INTERLOCKING.

ONE of the most interesting reports which was submitted at the recent meeting of the American Railway Engineering Association, was that of the Standing Committee on Signals and Interlocking. The major portion of the report of this committee is devoted to a discussion of the effect of treated and metal ties on track circuits. The committee sent out a circular letter to all members, to which 126 replies, representing 92 railroads, were received. Sixty-nine of these roads use no zinc treated ties; 4 of them use these ties to such a limited extent as to render an opinion impossible; 7 companies use these ties extensively, but do not have them installed where track circuits exist. Out of the total number of companies replying, only 12 use such ties in connection with track circuits. The committee points out from this fact that the question of the effect of zinc treated ties upon signal circuits is not a pressing one to the great majority of roads at the present time, but it is of value chiefly from the standpoint of future development.

The conclusions of the committee, based upon an analysis of the replies received, and other evidence collected, is:

"(1) That track circuits a mile in length are rendered inoperative by the extensive use of zinc-treated ties.

"(2) That track circuits 2,000 feet in length may be operated successfully even with 50 per cent or more of ties so treated.

"(3) That 10 per cent to 15 per cent renewals a year will not materially affect such length circuits.

"(4) That where renewals are made of fifteen

Digitized by Google

or twenty adjacent ties the leakage is much greater than where they are made singly at uniform distances, i. e., with 15 per cent renewals (every sixth or seventh tie).

"(5) That while the surface salts are present more leakage occurs during wet weather than with untreated ties, as these wet salts form a better conductor than ordinary wet wood.

"(6) That in dry, hot weather the salts are drawn to the surface and constitute a more or less perfect conductor.

"(7) That after a period varying from three months to a year these salts disappear and subsequently no interference is noticeable."

As regards metal ties, the committee stated that it was self-evident that each rail must be completely insulated from its ties to prevent a short circuit; that defective insulation at any point will cause leakage, and a current at both ends of even one tie will throw the track circuit out of service. So far as the committee was able to ascertain, the effect of creosoted ties is not serious, particularly where alternating current track circuits are used.

The committee on ties submitted a report, stating that an exhaustive study of stresses in cross ties had been made during the previous two years. The committee was of the opinion that it was impracticable to define experiments which would determine the proper size of cross ties. The report further stated that the committee had been unable to obtain any definite information relative to the effect of different designs of tie plates and spikes on the life of the tie, although experiments now being conducted would, it was hoped, give such information.

Report of Committee on Ballast.

THE committee on ballast, in its report, proposed service tests to determine the proper depth of ballast of various kinds. In all six tests were proposed covering practically every condition ordinarily encountered, the cost of which is estimated by the committee to be about $3,000. The committee reported concerning the cleaning of stone ballast by the use of screens, expressing the conclusion that a gang of twelve men, properly equipped with tools, could cover about 165 feeet of double track per day of ten hours, making the cost per mile of double track $540, including not only cleaning the ballast, but dressing the track and disposing of dirt.

Material for Signs, Fences and Crossings.

THE committee on signs, fences and crossings, reported the results of an exhaustive study of various classes of material for use in such work. The average life of each class of wood was stated as ranging from 25 years for Bois d'Arc to 10 years for white oak. The committee pointed out that the decision should not be based entirely upon the question of life, but upon the question of cost, the final result being worked out on the amount which must be set aside each year for purposes of renewal. Upon this basis the relative cost per fence post ranges from one-half cent to two cents per year of life.

A very interesting feature of the committee's report was the discussion concerning concrete fence posts. The report presented a large amount of information concerning the design and method of manufacture of eleven different types, ranging in price from 12.8 cents to 25 cents per post.

The conclusions of the committee as regards concrete fence posts were that they were practical, economical, and a suitable substitute for wood; that the reinforcement should be placed as near the surface of the post as possible, one-half inch from the surface being the best location; that the post should taper from the base to the top, not being less than 5½ inches at the base and 4 inches at the top; that the concrete mixture should consist of one part cement to one of pit gravel, or one part cement, two parts sand and four parts crushed rock or screen gravel, the gravel or rock to range from one-fourth to one-half inch in size; that posts should not be made out of doors in freezing weather, and not exposed to the sun, but instead should be sprinkled with water during the first eight or ten days after being made; that the posts should be cured for not less than 90 days before being set or shipped, and when shipped, to be packed in straw, sawdust or other suitable material, and carefully handled.

The Fence Wire Question.

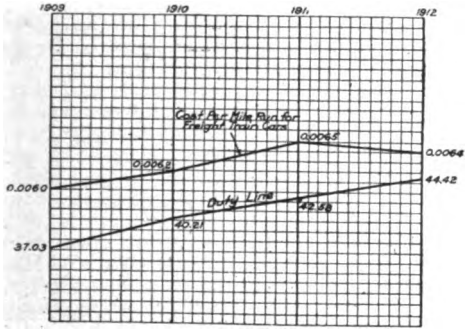
ANOTHER interesting report was that submitted by the committee appointed to investigate the means for obtaining non-corrosive fence wire. The committee reported that developments in the manufacture of such wire had been very few, both in this country and abroad. The committee found that English railway companies were not satisfied with wire supplied by United States manufacturers, and that one company had installed machinery for the purpose of manufacturing wire for its purposes. It was claimed, according to the committee, that English galvanizing was greatly superior to that of this country; that it was very largely done by the cold process of what was termed "electro-galvanizing." One American railroad company, the name of which was not given, which had been conducting tests since 1909, reported that the wire galvanized after weaving was found to be in perfect condition, with no indication of rust. With the ordinary dipping process corrosion had been rapid during the past year, the galvanizing entirely disappearing. The specially galvanized wire was found to be in excellent condition, while sherardized wire showed corrosion in an advanced stage, the preventative having practically disappeared. The last named method of treating wire had proved less satisfactory than any of the others.

Maintenance Cost of Freight Cars.

MOST car builders have recognized for years that the calculation of the maintenance cost on the car mileage or car-per-year basis is an unsatisfactory method because no consideration is taken of the productive mileage which the car has made. The enormous number of cars which must be covered in such accounting, and the fact that during a large part of the time they are on foreign lines, has made this problem particularly difficult, although it is generally recognized that an accurate unit of measure should be devised.

Mr. J. C. Fritts, master car builder of the Delaware, Lackawanna and Western, has made the suggestion that a proper basis of comparison would involve the three principal factors of car

Digitized by Google



Showing Comparative Trend of Maintenance Cost and Duty Performed by Freight Cars on the Delaware, Lackawanna & Western.

miles, carrying capacity, and average tons per train. He suggests the following formula: "Average mileage per car multiplied by average capacity per car multiplied by the average train tons divided by 4,000,000. (The figure 4,000,000 has no significance; it is merely used in reducing the result to a figure more easily handled)." Applying this formula to the freight equipment on the Lackawanna system, he finds that while the cost per car mile for repairs has increased 66-10 per cent from 1909 to 1912, the duty performed by the car equipment has increased in the same period 19-110 per cent. The comparison by years is shown graphically in the accompanying chart.

Automatic Train Stops.

THE general details of the two automatic train stopping devices which have been selected by the New Haven for the purpose of experimentation, as announced in the last issue of the RAILWAY WORLD, are now available. The two devices which are to be tried are being constructed respectively by the Union Switch and Signal Company and the International Signal Company. Both devices are similar in so far that they are both intermittent contact devices, and the most promising feature of each is that the apparatus is tested each time the train passes over it.

The speed control feature of one of these devices is particularly promising, as it is impossible to vary the speed control according to physical conditions and speed desired, so that at one point if the engineman should exceed a speed of twenty-five miles an hour while passing a stop or slowdown signal, the train would be stopped; while at another point, if he should exceed a speed of fifteen miles an hour under the same conditions the train would likewise be stopped.

The other device is superior in that it requires no electrical apparatus on the locomotive and therefore the device may be inspected by enginemen who are familiar with air brake apparatus and valves.

New Electric Car Heater.

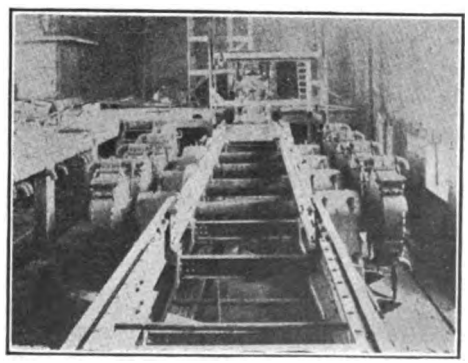
ONE of the serious questions confronting railway men in connection with the electrification of their roads is that of car heating. The Pennsylvania System is now experimenting with a new style of heater devised by Mr. J. T. Wallis, general superintendent of motive power of the Altoona shops. The new system consists of an electrically heated boiler of the flash type, designed to generate steam, a four-cylinder feed pump and a water tank placed between the frames of the electric locomotive. In operation, when the steam reaches a certain temperature and predetermined pressure, the pump is automatically shut off, and remains so until more water is required, when it is again automatically cut in, thus supplying the necessary water for steam heat. Through this device it is possible with electric locomotives to heat cars in exactly the same way as is now done.

Tests of a New Brake.

IT is reported that tests are being made on the West Jersey division of the Pennsylvania System of a new device which it was claimed will bring a train to a complete stop within a much shorter time than is now possible. Trials are being made with a view to the introduction of the device, if found satisfactory, in connection with electrical operation. At present the electric trains on the West Jersey and Sea Shore, and in fact on all of the Pennsylvania lines, are supplied with air brakes which are constructed on the same system as brakes in use on trolley cars; that is, the increase or decrease of pressure in the air tank automatically starts and stops an electrically propelled pump, which keeps up a given amount of air for supplying the brake pistons. Under the new methods air will be eliminated as an agent of control and the train will be operated, lighted, heated and brought to a stop by the use of electrical power.

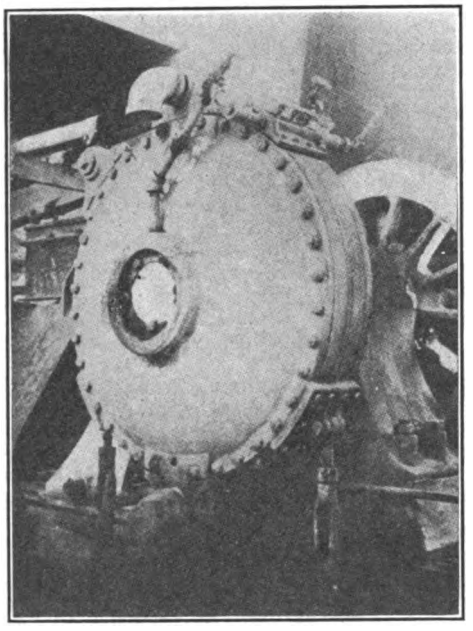
New Locomotive Testing Laboratory.

AT its last session, the Legislature of the state of Illinois included among its appropriations for the University of Illinois the sum of $200,000, which has been expended by that institution for the erection of a transportation building and a locomotive laboratory for the department of railroad engineering. This plant, which has just been completed, is one of the most complete in the world, and will be of the greatest service to the railways in the scientific settlement of many important questions concerning the design and con-



REAR END OF TESTING PIT, SHOWING THE REMOVABLE TRACK, THE SUPPORTING WHEELS, THE BEARINGS AND THE BRAKES IN POSITION.

Digitized by Google



AN EXTERIOR VIEW OF ONE OF THE BRAKES.

struction of locomotives. Some of the interesting features concerning the equipment of the plant are shown in the accompanying illustrations. The general design of the testing devices is similar to those heretofore employed in the dynamometer in the Pennsylvania Railroad Company's plant at Altoona. While the Pennsylvania plant has a maximum capacity of 80,000 pounds, the new plant of the University of Illinois possesses a capacity of 125,000 pounds, or about 15,000 pounds in excess of the greatest tractive effort which could be imposed upon it by even the most powerful Mallet locomotive now in existence. The plant has been designed to receive the largest existing locomotives of the Mallet type, while considerable margin has been left at every point to take care of the future increase in the size, weight and power of locomotives. The type of brake used to absorb the power from the driving wheels is shown in the accompanying illustration. It is of the type used in all other American testing plants, and proven by experience to be satisfactory in operation. Each brake is designed to develop resisting torque of 18,000-pound-feet, which is more than is likely to be submitted to it by the most heavily loaded locomotive driver. Considerable latitude has been allowed in the construction of the bearing pedestals, permitting the use of from 52 inches to 72 inches diameter supporting wheels. The laboratory throughout is fitted up in the most approved manner, and contains every device essential for the accurate and scientific testing of locomotives of every description.

Electrical

Discussion on Electric Operation before the New York Railroad Club.

THE New York Railroad Club held its ninth annual "Electric Night" on March 20th. These evenings have become matters of great interest to all railway men interested in electrical operation, because at these gatherings are brought together some of the most eminent men in this field, whose prepared remarks and extemporaneous discussions serve to sum up in an authoritative manner the progress which has been made in the preceding year. Mr. William McClellan, consulting engineer of New York, opened the discussion. He stated that not a dollar had been spent for the advancement of new projects during the year 1912, and that the most important work for the year 1913 would be that already announced by the Rio Grande and St. Paul systems. It was his opinion that no steam railroad could contemplate the large investment required for electrification under present conditions, considering the trend of regulation of corporations, the prices of material and the uncertainty of the labor situation. There was nothing experimental about the technical side of the question; it was one of finance and of the current situation.

Mr. E. B. Katte, chief engineer of electric traction of the New York Central, reported that during the past year his company had extended its multiple unit operations to the present terminal at Croton, and that a considerable amount of electrical installation in sub-stations, distributing lines, etc., had been made necessary thereby. Electrical and multiple unit cars of this company have now been in operation for more than six years, and during 1912 the maintenance and renewal cost of locomotives, including shop expenses, painting, etc., was 3.34 cents, while compared with 3.2 cents in 1910 and 3.08 cents in 1911. The maintenance and renewal cost of the multiple unit cars had been respectively 1.08 cents, 2.1 cents and 1.9 cents in these years.

Mr. Frank J. Sprague reviewed the various advantages and disadvantages of single phase alternating current and direct current operation. He stated that while the art had practically arrived in sight of the limiting potentials of such system, there was still no general agreement as to fundamentals, and the situation was much involved because of professional and manufacturing rivalries. He believed that greater co-operation should be brought about between manufacturers to relieve the railways, in a large measure, of the financial burden of electrical equipment. He believed that this would require the development of a financial organization outside of the manufacturing and railway companies. He advocated the creation of a group of consulting engineers, to be compensated by the manufacturers through a joint fund, to whom all difficult technical questions might be referred for advice, and the formulation of conclusions. Such a board of engineers, which would devote their entire time to this work, would collect and correlate all of the reliable information to be had upon the various questions confronting the industry.

This view was endorsed by Mr. C. O. Mailloux, consulting engineer of New York, who pointed to

Digitized by Google

the work which a technical commission had done in Germany in carrying out the famous Zossen high speed electric railway tests. According to his views not more than 10 per cent of the steam railroads in the United States could be profitably electrified at the present time. Mr. Frank Hedley, vice-president of the Interboro Rapid Transit Company, took issue with this statement, believing that a larger percentage of steam railroads were ripe for electrification.

Details Concerning Pennsylvania Railroad's Electrification.

ALTHOUGH no official information has been forthcoming regarding the plans of the Pennsylvania Railroad Company to electrify its main line from Philadelphia to Paoli, other than the official announcement reported in the April issue of the RAILWAY WORLD, what appears to be authentic information concerning some of the main details are forthcoming. *The Electrical World* states that it is unofficially informed that alternating current will be used, and that the company will buy energy locally, at least for the next few years. This is borne out by an answer which President McCall, of the Philadelphia Electric Company made in response to a question of one of the stockholders at the annual meeting of his corporation, in which he stated that the "prospects were bright" for securing the contract for supplying the energy for the line to Paoli. From other sources it is reported that the third rail, rather than the overhead system of supplying electric current will be employed, and that the suburban service will be operated largely with the multiple unit system rather than by the use of electric locomotives.

It is rumored that the company is seriously considering the question of electrifying its Baltimore Terminal. This rumor is given some color by recent large purchases of land in Baltimore in the interest of the Pennsylvania. According to the *Baltimore Sun*, the plan includes not only the electrification of the Calvert Street Station and of the tunnel, but also of the suburban lines outside of Baltimore on the Northern Central up to and perhaps beyond Parkton and through the Green Spring Valley as well as the Pope's Creek branch and the Sparrows Point line. The *Wall Street Journal* states that the next steps in the Pennsylvania electrification, in addition to the work in Baltimore, will probably be the electrification of the Washington Terminal, and eventually the coupling up of the Philadelphia, Baltimore and Washington sections by the electrification of the entire line between these points.

NEW TYPE OF ELECTRIC LOCOMOTIVE FOR NEW YORK CENTRAL.

THE New York Central has recently placed in service an electric locomotive of a new type, representing an advance over the standards heretofore employed by this company. The new locomotive, which is the result of an exhaustive series of tests made by the railroad company, is being constructed by the General Electric Company. It possesses the advantage of being some 15 tons lighter than those now in service, the estimated weight of the new locomotive being 100 tons. At the same time it is more powerful, and is designed with ample forced air ventilation, with a view to continuous high speed service. In the old type of locomotives only 70 out of 115 tons of weight was carried on the driving wheels, the balance of over 40 tons being surplus weight, which was carried by the bogie trucks, and which was added for the sole purpose of guiding the locomotive. The new locomotive, on the other hand, carries the entire weight on motor driven axles, and is capable of exercising sufficient tractive effort to haul a train weighing 1,000 tons at 60 miles per hour. It will have, in regular service, a continuous capacity of 1,400 horsepower, and can develop as high as 5,000 horsepower for very short periods.

The most striking change in the new locomotive, as compared with the previous standard, is the addition of motors to the bogie trucks and a still greater separation of the fixed wheel base and the guiding trucks. The latter has necessitated the lengthening of the machine, requiring the construction of the running gear in two halves, with a spring-connected articulated joint between the frames. The general appearance of the locomotive and its more important dimensions can be gathered from the accompanying illustrations.

High-Speed Locomotive—Elevation Showing General Dimensions

Plan to Compel Electrification in Chicago.

AN ordinance was introduced into the City Council of Chicago on April 14th requiring all railroad companies to operate trains by power other than steam on and after July 1st, 1914. A fine of $200 for each time a train or car is operated after that date in a manner that produces smoke or gas injurious to the public health, comfort or convenience is provided. The ordinance was referred to the committee on local transportation.

Electrification of California Lines.

IT is reported that the Ocean Shore Railroad, running between San Francisco and Santa Cruz, has decided to electrify its line. No decision has been reached as yet concerning the question of the advisability of using storage battery car, the overhead trolley or the third rail system, although it is believed that under the circumstances the storage battery car may prove to be the most desirable.

The new Oakland, Antioch and Eastern Railway has put into operation a stretch of 37 miles of line from Oakland to Bay Point, and is rapidly pushing the work on the balance of the line so that within a few months the entire road from Oakland to San Francisco and Sacramento, with the various branches, will be in operation by electric power.

Norfolk and Western to Electrify Section.

PRESIDENT L. E. JOHNSON, of the Norfolk and Western Railway Company, in reply to an inquiry of the *Manufacturers' Record* concerning whether his company was planning to electrify the Mountain division of its line, replied, in part, that "The Norfolk and Western is arranging to electrify its line from Eckman to Bluefields and the preliminary work in connection therewith is now under way, but the plans are not sufficiently advanced to give out any details. Negotiations are in progress with the Appalachian Power Company, but whether we will take power from it or not is as yet undecided."

The distance from Eckman to Bluefields is 27 miles, and through a mountainous country. The Appalachian Power Company, which has large hydro-electric plants in Virginia, has its distribution system in the same territory as the section of the Norfolk and Western which it is proposed to electrify.

Electrification Plans of the Rio Grande.

ENGINEERS of the General Electric Company have completed their preliminary estimate of the cost of the contemplated electrification of the portion of the lines of the Denver and Rio Grande over Soldier Summit and Tennessee Pass in Colorado and Utah. The plans, it is understood, provide for the electrification of the line from Helper, Utah, to Salt Lake City, a distance of 131 miles; as well as the double tracking of the road over the mountain. It is believed that the total expenditure will be about $8,500,000. The plans will be considered in the near future by the board of directors.

Proposed Legislation in New York.

THE State Senate of New York has passed two bills intended to regulate and facilitate the development of hydro-electric power. The first bill is intended to permit the State Conservation Commission to utilize the surplus water in large canal dams in the Mohawk Valley for the generation of electric power. The second bill, known as the Walters bill, is intended to encourage the formation of corporations to develop and privately own water power. It authorizes corporations to issue 50-year bonds to build storage dams, the bonds to be retired out of the revenue, and when so retired the work to revert to the state. The corporations formed under this act are to pay an annual tax of $3 for every million cubic feet of water stored.

Ontario Government Planning Electric Lines.

THE Ontario Government has introduced a bill into the Provincial Legislature providing for the creation of a hydro-electric power commission which, whenever required to do so by the Lieutenant Governor in Council may investigate and report upon the cost of constructing and operating electric railways in any locality where power is supplied by the commission, together with an estimate of the probable revenue therefrom and the economic value of the line to the locality. It is understood that this is the first step looking toward the building up of a network of radial railways in connection with the provincially owned hydro-electric system. The leader of the opposition party publicly congratulated the Government on the introduction of this bill, which would indicate that it will be passed without difficulty.

Terminal Improvements

PLANS FOR RAIL AND WATER FREIGHT TERMINAL IN NEW YORK.

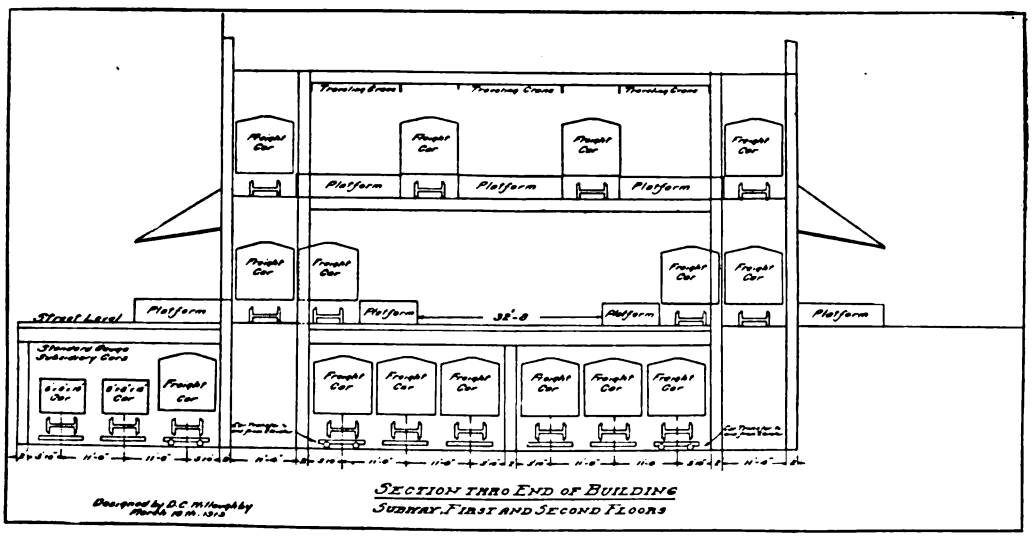
MR. D. C. WILLOUGHBY, a citizen of New York, has submitted to the Board of Estimate and Apportionment of that city a plan for the construction and operation of a great subway rail and water freight terminal on the Marginal Way of West street, on the Hudson or North River. This plan, unlike a great many such projects, has passed sufficiently beyond the paper stage to warrant serious consideration, for it has been submitted to eminent engineers, who have made tentative favorable reports thereon, and in addition, two responsible banking firms—Landenburg,Thalman and Company and Kissel, Kinnicutt and Company—have committed themselves to finance the project, providing the details can be satisfactorily worked out.

The plan proposed is to build a general modern freight terminal between West street and the North River, both north and south of 30th street, together with a six-track subway on the Marginal Way, constructed to provide for the movement of standard freight cars, from which sidings will diverge at frequent intervals to the various warehouses, loft buildings and factory buildings comprising the terminal. This six-track subway is to be connected by two or four single tube tunnels under the Hudson River, with a commodious general terminal classification yard in New Jersey, to which yard all of the railroad lines terminating in New Jersey shall have connections. In addition, the New York Central will make a physical connection with the six-track subway paralleling the river front. If this plan were executed, therefore, every railroad system reaching the harbor of New York will be able to discharge carload lots of goods, without unloading, at the factories, warehouses or the ship's side along the west water front of Manhattan Island.

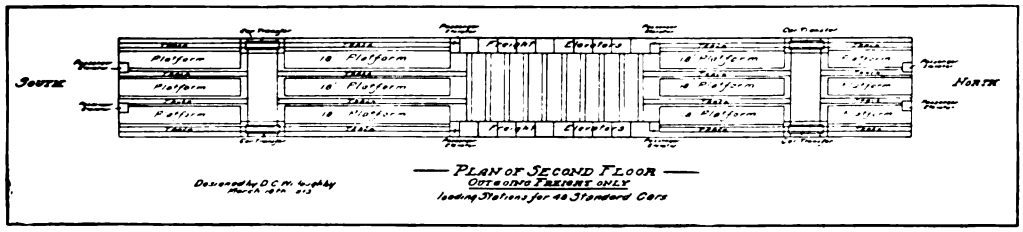
The magnitude of the project can be judged from a few typical facts; the storage and classification yard, for example, to be located in New Jersey, is to have a capacity of 11,600 cars, and is to be laid out according to the most modern practice for such yards. The car capacity of each building for loading and unloading without interference with running or switching movements of the subway is to be 154 cars, or for the 17 warehouses which it is proposed to presently erect, a total of 2,618, to which should be added a car capacity for the six public market places provided in the plan for 24 cars, making a grand total of cars which can be simultaneously loaded or unloaded, of 2,642 cars.

The engineers employed in connection with this project report that at the present time the total average number of cars floated by car floats by all of the railroads across the North River to pier stations on Manhattan Island is 5,310 cars per day; in other words, the new terminal would provide at the beginning facilities for loading and unloading freight equal to one half of the present business of all the terminal piers on the North River. The tunnels and marginal subway would, of course, have a capacity considerably in excess of the immediate requirements. The engineers further estimated that with the completion of this project, the railroads would save from their operating cost between the New Jersey meadows and their water front terminals in Manhattan, $2 per car, representing the cost of the switching movement; 22 cents per ton for double handling on and off of their New Jersey piers; the excess in the cost of handling the freight at their New York pier stations over and above the cost at the proposed terminal; and finally the excess in cost of handling freight at the ship's side, amounting to 11 cents for eastward freight and 14 cents for westward freight, plus their lighterage expense, which is figured above 40 cents from bulkhead to bulkhead, exclusive of labor.

The plans for the construction of the buildings do not involve any radical departure from the practice heretofore employed in connection with the Bush Terminal and other projects of a similar character. The cuts reproduced herewith show



Digitized by Google



the proposed type of construction for the buildings to be erected. The buildings to be constructed at this time are to be used for storage warehouses, or as lofts, the two upper stories being adapted to manufacturing. Each of the buildings is to be 100 x 750 feet, nine stories high, constructed of concrete and brick. The street level of the buildings will be arranged as local freight yards for receiving and discharging freight. The second story will be used for handling steamship, local shipper or "interchange of cargoes" by rail. It is planned that the original installation shall consist of seventeen buildings.

The total cost of the project is estimated at $85,000,000, and as has been said, this sum is substantially underwritten. It is proposed that the company shall receive a franchise under which the city shall have the right to repurchase after the expiration of ten years, at the original cost plus 15 per cent for contractors' profit—the profit being decreased on a sliding scale after that time so that at the expiration of the franchise, at the end of 50 years, it shall have been reduced to nothing. The buildings and property of the company are to be vested absolutely in the city at the expiration of 50 years.

One of the most interesting articles of the month is that appearing in the *Railway Age Gazette* of April 11th, entitled "New York's Freight Terminal Problem." In this article a careful review is made of the advantages and disadvantages of various terminals now existing, the terminal requirements of Greater New York City, and the various steps which are being taken to provide additional facilities, both to meet present requirements, and to make provision for the future. We reproduce herewith the diagram which accompanied this article, showing the proposed connecting railroads and terminal development sites for New York City. It will be seen that the plan as outlined is a most comprehensive one, and would give adequate terminal facilities for every part of Greater New York.

Practically all of the plans which have been proposed by various railroad officials or city officials of New York City are commented upon in this article. An interesting feature is that the proposal projects two freight tunnels at the bottom of the upper basin, almost opposite the Bush Terminal, between Richmond and Brooklyn, thus giving to the Baltimore and Ohio, and other companies, direct tunnel connection with Long Island.

The plan involves the familiar proposal for the construction of an elevated freight road in New York City and the construction of a mammoth joint classification yard, near the site of the proposed tunnels on the New Jersey side, which should be connected in turn by all of the Jersey roads by a belt railroad, as shown in the map.

PROPOSED CONNECTING RAILROADS AND DEVELOPMENT SITES FOR GREATER NEW YORK.

Digitized by Google

NEW YORK CENTRAL SOLVES WEST SIDE PROBLEM

AN agreement has been reached between the officials of the New York Central and a special committee of the Board of Esimates, for the solution of the vexatious problem on the West Side of New York City. The plan as agreed upon provides for the comprehensive improvement of the west side piers, and the development of additional railroad facilities upon the water front. The city will be under no expense in connection with this work. The entire cost, estimated at from fifty to sixty million dollars, will be born by the railroad company. The agreement provides for a crossing over the Harlem River, a ship canal at the northern end of the island, a tunnel along Inwood Hill from a point under the brow of the hill to Dyckman street, and a tunnel through Fort Washington Park. The railroad is granted easements for a six-track right of way. The agreement calls for roofing of tracks along Riverside Drive from 122d street to 72d street and the retention by the city of marginal strips outside of the railroad's right of way from Dyckman street to 50th street.

The New York Central will construct a four-track subway through what is now private property from 59th to 44th streets, and an elevated railroad from 42d street to the present 30th street yards. South from 30th street a two-track subway is provided for under 10th avenue to 15th street, thence under the present Gansevoort market site to the head of Washington street to Canal and Varick streets, at which point the subway will enter the company's new extended St. John's Park yard.

The cost of roofing the tracks along Riverside Park is estimated at $7,000,000. The new 1,200-foot steamship piers will be built in the stretch between Fifty-ninth and Forty-fourth streets. The company's subway will curve inland around the new piers. On the roof of the subway there will be a new marginal way and every cross-town street from Fifty-ninth to Forty-third streets will have its grade altered so as to run up to the marginal way. From this direct access at grade will be given to the second stories of the structures to be built on the new piers. There is no intention of altering the railroad's freight yards covering the district between Seventy-second and Sixtieth streets.

NEW FREIGHT CLEARING YARD FOR CHICAGO.

AT a meeting of the Board of Directors of the Belt Railway Company of Chicago, held on March 4th and 5th, final plans for the construction of the great clearing yard located on the outskirts of the city were approved. Work is already commenced, and the first unit of the new yards will be completed early in 1914, at an estimated cost of $5,000,000.

The Chicago and Western Indiana Railroad Company, the owner of the physical property operated by the Belt Railway of Chicago, executed a lease of this property to the Belt Railway running for a period of fifty years from November 1, 1912; also of the property formerly owned by the Chicago Union Transfer Railway Company and purchased by the Chicago and Western Indiana Railroad Company in October, 1912. This lease is coupled with an operating agreement running for a corresponding period between the Belt Railway and its eight owner lines, providing for a division of the working expenses of the Belt Railway on the basis of proportionate use.

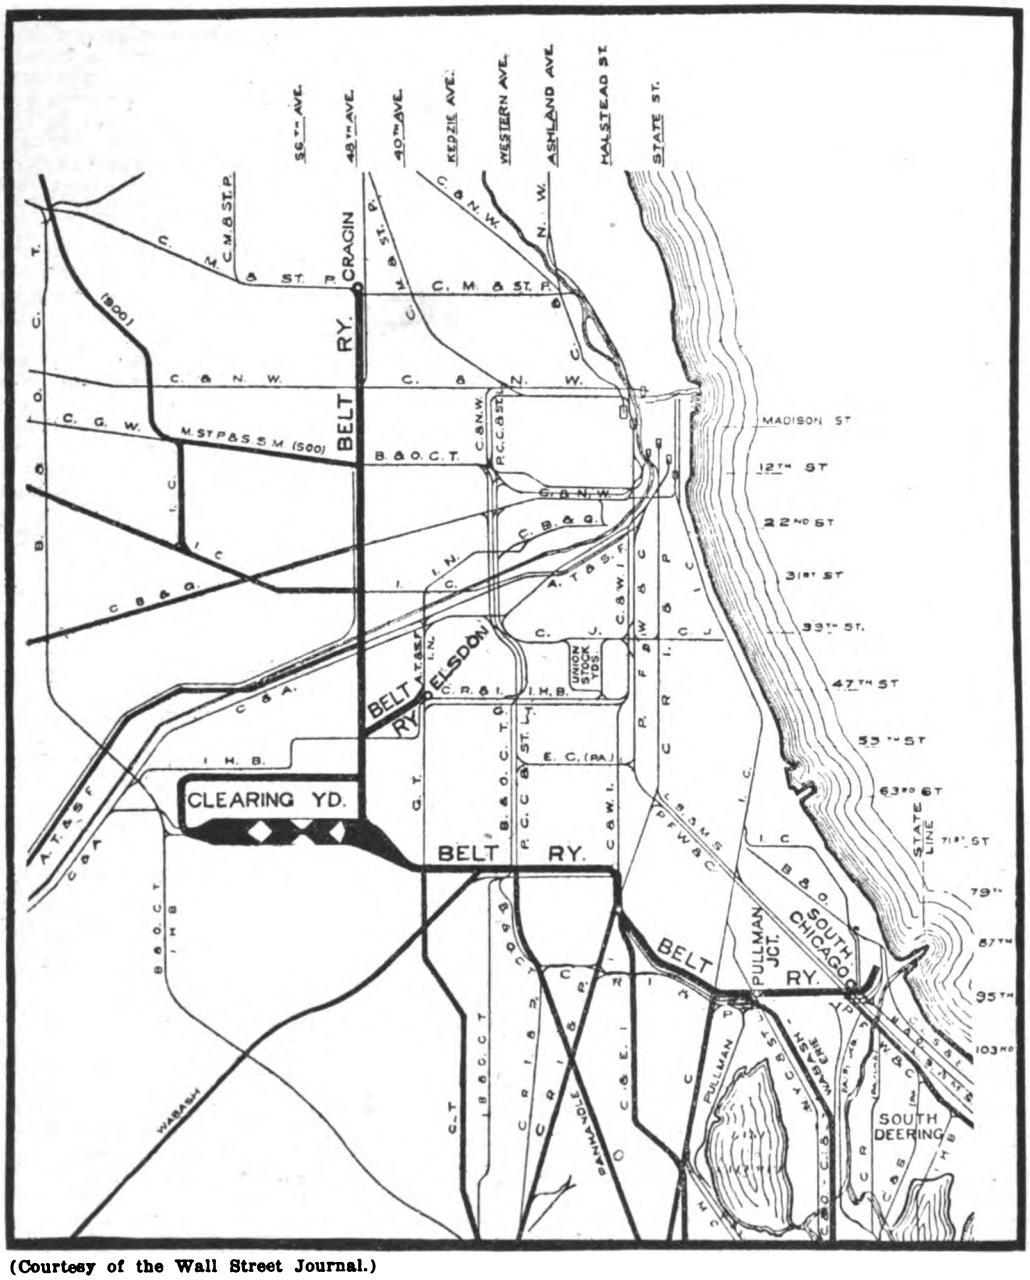
Under the purchase of the Chicago Union Transfer Railway Company's property the Belt Railway secured some 1,237 acres of land for construction of the clearing yard and since then 600 additional adjoining acres have been purchased. This land will permit the ultimate construction of yards capable of handling 20,000 to 30,000 cars per day and transfer freight depots for less than carload traffic. Plans are now being drawn for a very large transfer station of this character to be equipped with mechanical handling devices and so arranged as to accommodate all the owner lines of the Belt, with room for great expansion and ultimately space for all of the Chicago railways. Round houses, car and locomotive repair shops, storekeepers' warehouse and offices for operating and accounting forces and provided for in the present plans and will be erected during the year. Additional main line tracks, the elevation of portions of the main line and an auxiliary clearing yard for the southern and eastern lines are contemplated in plans now under construction and provision has already been made for the financing of this work.

The construction of this great interchange facility marks an epoch in the commercial and industrial history of Chicago. Its benefits to the city and the Chicago railway Companies are far-reaching.

The railway terminal situation in Chicago has always been exceedingly complicated and utterly lacking in co-ordination or system. The enormous growth of the traffic handled in this district has presented to the railway companies a very difficult operating problem. The cost of handling has been excessive and frequent congestions of traffic have caused very great inconvenience and expense to shippers located in the Chicago district and those using the Chicago gateway. The very rapid growth of Chicago's commerce and the spreading out of industries into outlying portions of the city and suburbs have tended still further to complicate the situation. Attempts have been made from time to time during the past ten years to secure some permanent betterment of the Chicago situation, but without success, although the need for improvement has been keenly realized by railway officials. The establishment of the Clearing yard is the first important step towards an adjustment of this situation. Upon its completion a very large volume of traffic now being interchanged by the various lines through their own facilities in the congested part of the city will be handled at Clearing.

Less than carload traffic originating in the outlying portions of Chicago, or delivered by shippers at union stations, also forwarded from industries and warehouses in so-called "trap-cars" will be taken direct to Clearing station for loading into scheduled outbound merchandise cars. This traffic at present is very largely

Digitized by Google



(Courtesy of the Wall Street Journal.)

CHICAGO'S NEW FREIGHT TERMINALS AND CLEARING YARD.

taken to city depots located in congested districts, which in all cases, have not sufficient capacity to handle traffic delivered by teams to say nothing of the business brought in from outside points. It is estimated the capacity of the city freight depots will be increased 30 per cent under the new plan. Arrangements are being considered now for connections with the Illinois Tunnel Co.'s system and lighterage companies operating on the Chicago river, which will further tend to relieve inside congestion.

The very great benefit of this plan to the owner lines of the Belt may be appreciated by the statement that it will add to their Chicago terminals, yard facilities equal in capacity to 10,000 cars per day and to city freight depots 30 per cent to 50 per cent of their working capacity.

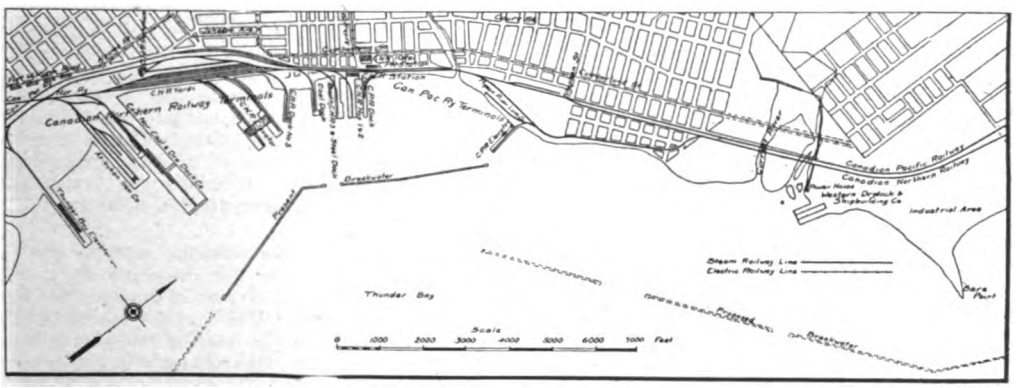
RAILWAY TERMINALS AT PORT ARTHUR.

THE marvelous growth of the rich agricultural territory in central Canada is bringing unparalleled prosperity to Port Arthur and Fort William, which are the natural gateways for the exportation of the grain and other products of this rich territory. The railway systems enjoying this business, that is, the Canadian Pacific, Grand Trunk Pacific and the Canadian Northern, are making extensive plans not only for the present, but in order that they may have room for future expansion with the inevitable growth in the traffic at these points.

At the present time the Canadian Pacific has a battery of three modern grain elevators at Fort William, a large coal handling plant equipped with the latest mechanical devices, besides extensive piers and storage sheds at the same point.

At Port Arthur the Canadian Northern has a large frontage with numerous wharves and storage sheds, and plenty of opportunity for expansion. This company, moreover, has one of the largest sets of grain elevators at this point in the world, with a capacity of 12,000,000 bushels. The same company, in conjunction with the Ore Dock Company and the Antikokan Iron Company, has erected an enormous ore and coal handling plant capable of storing 500,000 tons of coal.

The Canadian Pacific has unusually good facilities, as is seen by the accompanying illustration showing the layout of the water front of Port Arthur. A notable feature as regards the Canadian Pacific is the large amount of space which the company possesses for the purposes of future expansion.



-Plan Showing Railway Connections Around Port Arthur.

Interstate Commerce Commission

Concerted Movement for Higher Freight Rates.

RAILROAD managers throughout the country plan to shortly file with the Commission, application for increases in freight rates. The conditions which confront the carriers at the present time are such that unless certain advances in rates are soon permitted, the commerce of the country will suffer a severe check. The demand for improved terminal facilities, for double tracking, for additional lines, for larger equipment, are becoming more insistent each day, and it is a well known fact, with which the Commission is thoroughly familiar, that these conditions cannot be satisfactorily met, unless the carriers are permitted, in some way, to expand their present revenues. The recent increases in the wages of both the engineers and firemen and the demands of other employes now before the managers, have made the general rate problem more acute, and it is not to be wondered at that railroad officials are about to apply to the Commission for relief.

In this connection, the recent decision of the Commission in the Intermountain rate case, to which we refer later, and which is generally favorable to an increase in certain rates by these roads, is significant, in that the practical effect of this decision is to raise rates on these Western roads where the ton-mile rates are already far above the average. If the Commission allows increases under such conditions, it is certainly not unreasonable to expect that it will also permit other roads, whose average rates are not so high, some measure of relief.

Commission Names Valuation Board.

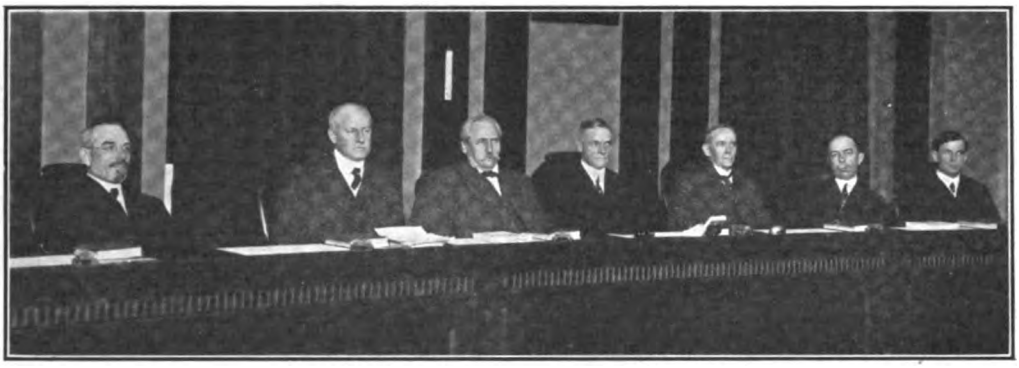
ANNOUNCEMENT has been made by the Commission of the selection of the members of the Board of Engineers who are to assist the Commission in formulating a plan for the physical valuation of railroads. It is expected later to arrange for the appointment of an army engineer to be added to the members already selected. This board will, after perfecting plans in consultation with the Commission, have direct charge of executing the work.

The board as announced by the Commission is as follows:

"R. A. Thompson, now employed in valuation work by the California State Commission, and formerly employed in like work by the Texas State Commission. The California Commission has agreed to release Mr. Thompson from his agreed definite term of service with them.

"W. D. Pence, chief engineer of the Wisconsin

Digitized by Google



THE INTERSTATE COMMERCE COMMISSION AS NOW CONSTITUTED. READING FROM LEFT TO RIGHT THE MEMBERS ARE: B. H. MEYER, J. S. HARLAN, J. C. CLEMENTS, E. E. CLARK, CHAIRMAN; C. A. PROUTY, C. C. MCCHORD AND J. H. MARBLE.

Railroad and Tax Commissions, and who has for some time been in the employ of the Wisconsin Commission in valuation work.

"J. S. Worley, of Kansas City, Mo., a consulting engineer in private practice, who has had experience in valuation work.

"Howard M. Jones, of Nashville, Tenn., a consulting engineer in private practice, and who has had much experience and who is especially familiar with bridge engineering.

"E. F. Wendt, of Pittsburg, Pa., president of the American Society of Civil Engineers, and now in charge of the engineering work of the Pittsburg and Lake Erie Railroad."

Efforts are being made through the War Department to have an army engineer designated to service to the Board. The Board will have charge of carrying out the actual work of valuing railroad property and at the same time make such recommendations to the Commission as it deems necessary in expediting the work.

It is believed among railroad officials that several years will probably be required to gather the necessary data for the proposed physical valuation. When the data is gathered, it is not unlikely that a number of representative railroad officials will be designated to take up with the Commission the leading principles involved in the whole question. Estimates of the time necessary to complete the work vary from two to five years.

Higher Pacific Coast Rates Approved.

THE Commission has approved certain increases in commodity rates by transcontinental and other railroads from the territory east of the Missouri River to Pacific Coast terminals. The Commission's action was the result of an agreement reached between the transcontinental lines and the shippers, and constitutes the first substantial encouragement received by the railroads to their contention that higher rates are necessary.

The carriers filed tariffs with the Commission which were to become effective September 31 last. These tariffs proposed to increase terminal rates to interior rates on all commodities which were not actually or potentially affected by water competition. Pending its investigation the Commission suspended the effective date of the increase. The decision allows most of the advances.

The decision also marks a new departure in the Commission's procedure, in that the railroads and the shippers have agreed on satisfactory rates and then submitted them to the Commission for approval. If the Commission had been obliged in this proceeding to deal with the usual contested record as to each increased rate the investigation would not have been completed for several months. More than 400 changes in rates were involved in the proceedings.

The increases in the terminal rates by the railroads grew out of the Commission's decision reducing the intermediate rates in the so-called Reno and Spokane cases. The carriers contended that the readjustment of the interior rates made it necessary for them to make changes in the terminal rates. The result of the carriers' policy was to increase their terminal rates, particularly on non-competitive freight. The Commission's decision says, in part:

"For many years the transcontinental lines have maintained commodity rates from east of Colorado points which were lower to the Pacific Coast terminals than to intermediate points such as Reno and Spokane, upon the theory that the former were forced by competition of the steamship lines from the Eastern seaboard via Panama.

"Following the amendment to the fourth section of the Act, in 1910, and proceedings of the Commission based thereon, carriers have filed tariffs in which it is proposed to increase the terminals rate to or in excess of the interior rates on all commodities which are not actually or potentially affected by this water competition. These tariffs are under suspension in this proceeding.

"Following the hearings before the Commission the parties have met in formal conference between themselves and, with the Commission and by their mutual concessions, most of the items in controversy have been adjusted satisfactorily to the shippers."

The Import Rate Case.

THE recent reopening of the import rate case before the Commission by Boston interests, has led the Pennsylvania Railroad Company and the Philadelphia and Reading Railway to file briefs regarding their position in the matter. These briefs maintain that no evidence has been submitted to sustain Boston's claim that it should be put on a parity with Baltimore or

Digitized by Google

Philadelphia with regard to import rates. The following points are made:

1. If the 70-cent scale Boston to Chicago applying on domestic traffic via differential all-rail routes be established via standard routes Boston to Chicago, the rates on third and fourth classes would be lower than the rates from Philadelphia.

2. For some time prior to 1907 the commodity import rates from Boston were the same as from New York, in 1907 one cent under New York, and in 1908 two cents under New York, or the same as from Philadelphia. There is nothing, therefore, in the history of these commodity rates which would in any way justify Boston taking either the Philadelphia or the Baltimore rate.

3. Boston as well as New York, Philadelphia and Baltimore has standard all-rail rates on the regular basis, rail and lake rates, and relative ocean and rail rates. Neither New York, Philadelphia nor Baltimore has any differential rate under the ordinary scale via any standard all-rail line, nor has New York, Philadelphia or Baltimore a differential rate via any all-rail line. Boston therefore, under the present adjustment has the advantage of a differential all-rail route which is not break-bulk, namely, the Boston and Maine in conjunction with the Grand Trunk or the Canadian Pacific.

The Commission and the Panama Canal Act.

THE Commission has made its first use of the Panama Canal Act in a recent decision in the case of the Augusta and Savannah Steamship Company against the Ocean Steamship Company, of Savannah, and other carriers, ordering the lines to file tariffs of through rates from points in Georgia to certain points in Massachusetts. The carriers at present have a joint tariff under which merchandise may move from Augusta, Ga., to Savannah, Ga., to North Adams, Mass. The Commission held that the lines having voluntarily subjected themselves to the jurisdiction of the Commission with respect to traffic destined to North Adams, the Commission has authority to compel them to file similar tariffs with respect to other points similar to North Adams and perhaps in competition with North Adams.

Quoting that section of the Panama Canal Act whereby the Commission is given jurisdiction of the rates by rail and water from points in one state to points in another state "through the canal or otherwise," the decision says further:

"If the amendment applies to the traffic in question, the right of the Commission to establish this through route is clear. The defendants contend that it does not apply, for the reason that this amendment relates only to traffic which passes through the Panama Canal. They argue that the words 'or otherwise' modify the phrase 'by rail and water' and not the phrase 'through the Panama Canal or otherwise,' and the defendants have referred us to no canon of construction nor to any reason for disregarding the obvious meaning of those words. Indeed, a consideration of the situation to which the amendment applies would seem to conclusively demonstrate that the position of the defendants is not correct, since the words 'or otherwise' are pure surplusage if read as the defendants say they should be. Traffic through the Panama Canal can only move by rail and water, unless it moves from port to port, and in that case we have no jurisdiction. We hold, therefore, that the Commission has jurisdiction to establish the through routes and the joint rates prayed for."

In another decision the Commission also holds that carriers may not properly advance charges to ocean carriers on import traffic, except where property is billed through from point of origin to ultimate destination, and such through billing separates the liability of the inland carrier or carriers from the liability of the ocean carrier and shows the tariff rate of the inland carrier or carriers. Such charges of water carriers may not be advanced by railroad carriers subject to the act in cases where property moves under a separate contract of transportation from the port of entry to the final destination.

Decision on Lake and Rail Rates.

THE Commission holds that the carriers under certain conditions may advance their rates during the season when navigation is closed on the Great Lakes. The case involved was that of the American Insulated Wire and Cable Company against the Chicago and North-Western Railroad Company and others. It was charged that in the shipment of copper wire from Dollar Bay, Mich., to Chicago a rate of 15 cents a 100 pounds was charged on carload lots when navigation is open and 22 cents a 100 pounds when navigation is closed. The Commission holds that the maintenance of the varying rates is not in contravention of the statute.

Results of the Colorado Pass Investigation.

THE investigation recently made by Commissioner Harlan into the practice of the Colorado railroads of giving free transportation to government officials and large shippers within that state, has brought sensational results. Criminal indictments of large shippers and the offending carriers have been returned. Commissioner Harlan personally conducted an investigation and, in his own characterization of the situation it "developed violations of the law on an extraordinary scale." Mr. Harlan says in a preliminary report that "in one month over a single railroad seven thousand trips were made on passes. Not only shippers who controlled routing of traffic in any appreciable quantity were favored at all times, but even public officials, careless alike of duty, morals and danger, accepted, even demanded these favors of the carriers.

"The record shows that judges, state officials, members of the Legislature, county and municipal officers, including mayors and aldermen have generally made use of passes. Not only has this been the case but the record shows that where passes were not volunteered they were asked for by public officials. Even judges have not hesitated to pursue this course. Personal requests by judges upon the carriers for passes are disclosed by the record, accompanied by expressions of their sense of obligation for such favors granted to them both before and after they went on the bench.

"All classes joined in the orgy of petty graft; at once sacrificing rightful revenues of the carriers, discriminating against all small shippers and demoralizing all public officials, including the Legislature and the bench."

Commissioner Harlan says that the Colorado carriers have given assurance that they will conform their fare practices to the rulings of the

Digitized by Google

Commission in pass matters. The report does not disclose what further steps may be taken or other violations of law uncovered in course of the investigation but a final report is promised to make clear the views of the Commission in this forbidden traffic in transportation.

Order on Western Passenger Fares Extended.

THE order of the Commission requiring carriers in Central Passenger Association territory, on or before May 1st, 1913, to bring their passenger tariffs in harmony with the fourth section of the law, including instances in which interstate passenger fares exceed the combination of rates established by state authority, has been extended until May 1, 1914, with the understanding that unless by that time a definite order is issued by the Commission, a further extension will not be made.

Ruling on Excursion Fares.

ACCORDING to a recent decision handed down by the Commission, railroads may be held to be discriminating if they sell passenger fares of a certain nature between stations without selling similar fares to competitive points. The case in which this ruling was made was that of Hiram G. Beach against the Ann Arbor Railroad. The Ann Arbor has maintained a round-trip week-end fare of $1.25 during the summer season from Toledo, Ohio, to Whitmore Lake and Lakeland, Mich., which are summer resorts. The road refused to sell similar tickets to Hamburg, Mich., a summer resort located between Whitmore Lake and Lakeland. The Commission held this act of the road to constitute a discrimination, and ordered the road to correct its fares accordingly by June 1.

Final Plea in Express Rate Cases.

FINAL arguments in the express rate cases were presented before the Commission last month. Representatives of the express companies appeared to explain their exhibits of estimates of possible losses in revenue resulting from an application of the reductions in rates proposed by the Commission, and to argue therefrom that these proposed rates are unjust. It was declared that if the reductions are forced on them, the companies would not only suffer a great reduction in gross revenue, but would have an actual deficit after operation expenses have been paid.

Walker D. Hines asserted that for the five companies he represented—the Adams, American, United States, Southern and Wells-Fargo—application of the proposed rates to present business would reduce revenues about $20,000,000 a year, or 5.85 cents on every dollar's worth of business done. Such a reduction in revenues, he said, would be absolutely destructive. He maintained also that the formula-made rates would disturb seriously business conditions in large centers, such as New York and Chicago, by forcing a readjustment of competitive business conditions. Recent parcel post developments have also placed the express companies under an additional heavy handicap, which is having a decided effect upon their revenues.

Under these conditions transportation and shipping interests are generally looking for a postponement of any final decision by the Commission on the proposed new rates, until the express companies have had further opportunity to adjust their present rate schedules to meet the competition of the parcel post. Others in touch with affairs at Washington appear to be practically of the same belief and that the final decision as to new rates may not be forthcoming for a number of months or even a year. It is certain that the Commission cannot, until a considerable period of time has elapsed, judge fairly as to the effect of the parcel post competition upon the revenues of the express companies. It is believed that the Commission will preserve the fair attitude it has consistently manifested throughout the whole investigation, and there is little credence placed in the assertion, made in some quarters, that the Commission may feel morally obligated to stand by the rate reduction it tentatively adopted last May. Those who have watched the Commission's activities of the past know that such a belief is entirely unwarranted.

Express company officials freely admit that this new parcel post competition must be met. In fact, they clearly recognize in it a new factor of fast growing importance and one they will have to cope with. Under the circumstances, it is not unlikely that the Commission will permit the express companies to find their own solution to the new problem without having to contend at once with reductions in rates outside of the present parcel post domain.

Block Signal System Report.

THE Commission has compiled a bulletin showing the miles of railroad in the United States on which the block signal system was in use on January 1, 1913. This bulletin also contains tables showing the kind of automatic signals used and the methods and apparatus employed with the manual block system.

The total mileage in the United States operated by the block system on January 1, 1913, was 83,949.9. Of this total, 22,218.8 miles were automatic and 61,731.0 miles were manual.

Comparing the figures contained in this bulletin with the figures contained in the corresponding bulletin for January 1, 1912, which were compiled by the block signal and train control board, it appears that during 1912 there was an increase of 1,833 miles in the length of roads operated by the automatic block system and an increase of 5,656 miles in the length of roads operated by the manual block system, or a total increase for the year of 7,540.1 miles of railroad operated under the block system.

Rolling Stock Inspection Criticised.

CHIEF INSPECTOR BELNAP, of the Commission, has made a report to that body on the defects in the freight equipment and locomotives of the railroads. These defects, it is pointed out, are mostly in the coupling mechanisms, air brakes, hand brakes, hand holds and safety rails.

The report states that of freight and passenger cars and locomotives inspected during the last fiscal year more than 61 per cent per thousand are defective, this being an apparent increase.

One paragraph of the report, which incidentally mentions that 10,385 persons were killed and 169,568 were injured during the last fiscal year, is as follows:

Digitized by Google

"In many instances our inspectors have found that the only test made of the efficiency of the train brakes is one intended to show that the air is working throughout the train line. Under such a system of inspection the train crew has no means of knowing the actual condition of the air brakes. Such practices cannot be too severely condemned."

Chief Inspector Belnap makes the recommendation that the Commission take action to require the railroads to report twice a year the progress made in the equipment of their rolling stock.

The Chief Inspector has also made his report on the accident on the International Railway near Lockport, New York, on January 25th last. In this connection, he recommends a more general use of torpedoes. This accident, a rear-end collision between freight and passenger trains, resulted in the death of one passenger and one employe, and the injury of forty passengers and one employe. The passenger train consisted of two motor cars.

In his report, Mr. Belnap said:

"Short intervals between trains as were enjoyed by Motorman Mack do not furnish opportunity for adequate rest, and employes working under such conditions can not be considered as having had the rest necessary to enable them to perform their duties in the best possible manner. To provide proper safety, interrupted service of this character, covering such a length of time as existed in this case, should not be required or permitted.

"The rules of the International Railway do not require the use of torpedoes unless the view of an approaching train is obscured by fog, stormy weather, or in some other manner. Had the rules required their use under all conditions, and had they been obeyed, it is probable that if Motorman Mack was asleep the detonation of the torpedoes would have awakened him in time to enable him to bring his train to a stop and avert the collision. In the endeavor to secure the maximum degree of safety, the rules should require the use of torpedoes under all conditions."

Recent Decisions.

DURING the past month the carriers have been upheld in a number of important decisions by the Commission. Track storage charges made by the Long Island Railroad Company of Brooklyn and complained of as unreasonable by the Wholesale Produce Dealers' Association, have been declared fair. The dealers had avoided double drayage charges by selling their goods direct from the cars to the retailers.

A complaint filed by the St. Louis Blast Furnace Company against the Louisville and Nashville and other carriers, charging that excessive rates were exacted on shipments of coke from points in Virginia, West Virginia and Pennsylvania to Missouri, has been dismissed by the Commission. The Commission has also held as reasonable the withdrawal of joint rates on grain, grain products and seed from certain Minneapolis and St. Louis railroad stations west of Hanley Falls, Minn., via Minnesota Transfer and the Chicago, St. Paul, Minneapolis and Omaha road. It was found that the continuance of this route would reduce the revenue of the principal roads from one half to four cents per hundred pounds with an additional terminal expense at Minnesota Transfer. Writing the decision of the Commission, Chairman Clark says:

"In view of the continuance of the joint rates via Hanley Falls we cannot find that Duluth will be subjected to unjust discrimination by the withdrawal of the route via Minnesota Transfer. If, prior to the establishment of the joint rates via Minnesota Transfer, Minneapolis had prayed that they be prescribed, it would have been obliged to show that it was subjected to undue discrimination and that the Great Northern could be compelled to join in a through route via Minnesota Transfer, including substantially less than its entire line between the terminal of the through route, instead of taking the traffic at Hanley Falls."

Cement rates from points in Missouri and Texas to Little Rock, Ark., complained of by the Little Rock Chamber of Commerce have been upheld by the Commission, who, in its disposition of the case, discloses a new method pursued by shippers in their attempt to force railroads to reduce their rates. The decision says:

"It was shown that the major portion of the cement now used in Little Rock comes from the Kansas gas belt, principally from Iola, Kan., at a rate of 17 cents per 100 pounds, and that comparatively little cement moves to Little Rock from any Missouri or Texas points. It is a fair inference from the record that the main object of the endeavor to obtain lower rates from St. Louis or from Texas points is to force lower rates from the Kansas gas belt."

The custom of the transcontinental railroads to charge higher rates on oiled, greased or waxed wrapping paper than upon the same paper plain, has been upheld by the Commission. The queston was raised by the Robertson Paper Co., of Bellows Falls, Vt., which ships to Pacific Coast points. The rates to which complaint was made but which are sustained by the Commission are 75 cents on plain manila wrapping paper, 90 cents on the same when oiled or greased and $1.20 when waxed.

The Commission has decided that the proposed increases in rates of pig iron from Michigan upper peninsula, and Wisconsin to Missouri River rate points are unreasonable.

In determining the pig iron rates in the Michigan upper peninsular district, the Commission holds that the proposed increase of $1.09 per ton is entirely unwarranted. The decision says:

"We have reached the conclusion that the present rate from the northern furnaces to Missouri River rate territory, may properly be advanced. We find, however, that the rate of $4.16 to Kansas City, as proposed by the respondents is unreasonably high and should not exceed $3.58 a ton from Duluth, Ashland, Chocolay, Manistique, Newberry and the other northern points involved. The proposed rate of $3.58 a ton from those points to Omaha proposed by the respondents in the new schedule we also find to be excessive rate and we think it should not exceed $3.08 a ton. Such a rate from the northern points to Omaha as compared with the rate of $3.58 which we here fix from those points to Kansas City gives due recognition to the fact that the haul to Kansas City is about 200 miles longer than to Omaha.

The Commission is opposed to the proposed advance to 40,000 pounds of the minimum weight on ear corn, snap corn and corn in the shuck throughout the Southwest.

It finds reasonable, however, a flat minimum weight of the same amount, when standard 36-foot

Digitized by Google

cars or larger are furnished. It has ordered the carriers to cancel suspended schedules providing for the increase and to maintain the present minimum weight rule on cars smaller than standard.

Beet sugar rates also are found to discriminate against beet sugar factories in Ohio and Michigan. Rates of the Louisville and Nashville, from Cincinnati and points northwest to Knoxville and Chattanooga, are declared unreasonable when compared with rates from New York, Philadelphia, Baltimore and New Orleans. The rates of the carriers south of the Ohio River are ordered corrected according.

The complaint filed by the Montana Railroad Commission against the Northern Pacific Railway alleging that rates on carload of immigrant movables from Edmonds, N. D., to Shawmut, Mont., were unreasonable, has been upheld by the Commission. Reparation was ordered.

The Pennsylvania and other roads have been ordered to reduce their carload minimum of 10,000 pounds on chairs, n. o. s. set up, from Lewisburg, Pa., to Jersey City, N. J., to 8,000 pounds, the minimum which is applicable from other points. This decision was announced in the case of Josiah Partridge and Sons Company and others of Jersey City.

In the case of C. G. Justice Company against the Pennsylvania Railroad, the Commission held the charge of $5 per car for reconsigning carloads of green tomatoes at Altoona, Pa., to be unreasonable to the extent it exceeded $2 per car. The lower reconsignment charge was ordered into effect May 15.

The Commission also held to be unreasonable the proposed advance from $3 per car to $5 for switching grain and grain products between interchange tracks of the Rock Island and the mills of the Sheffield-King Company, Sheffield, Minn. A charge not exceeding $3 per loaded car and $1.50 on an empty car was held to be reasonable.

In the case of the Alfred Struck Company against the Louisville and Nashville and other railroads, the Commission held that a 30,000-pound minimum for a standard car loaded with doors and window frames, set up, shipped from Louisville, Ky., is unreasonable. The roads were instructed to fix a minimum of 10,000 pounds for a 36-foot car.

Railroads operating east of the Mississippi and north of the Ohio rivers in what is known as Official Classification territory, have been ordered by the Commission to reduce the classification of smokeless powder for rate making purposes. The decision was issued in the case of the United States against the Wharton and Northern and other railroads. The roads in this territory have been charging first class rates on carload shipments and double first class rates on less than carload. The Commission ordered the roads by May 15 to put into effect rates not exceeding second class on carloads with 20,000 pounds minimum, and one and one half first class, when in less than carloads.

A decision has been issued by the Commission holding to be reasonable the assessment of first class rates on printed advertising circulars, pamphlets, almanacs, etc., between points in Official Classification territory which embrace the stations north of the Ohio and east of the Mississippi rivers.

A complaint against these rates was made by the Proprietary Association of America, an association of manufacturers and jobbers of proprietary medicines. Their advertising matter is sent in less-than-carloads—bulks usually in packages weighing from 50 to 300 pounds, on which the first class rates are applied. The complainants contended that the value of these circulars is not more than $5 per 100 pounds and therefore the rates charged are excessive and the commodity should be accorded a fourth class rating. The complaint was dismissed.

Rate Suspensions.

AMONG recent rate suspensions by the Commission are the following: Advances in rates on grain products from stations in southern Illinois to Texas points, until August 23d; advances in the rates on ground iron ore from points in Alabama, Georgia and Tennessee to Boston, New York, Philadelphia and other points, until November 7th; cancellation of through rates on wool and mohair from north Pacific Coast points to Eastern points, until October 30th. This tariff was previously suspended from April 15th. Elimination of through rates on lumber and other commodities from north Pacific Coast points to Eastern points via Denver, until October 30th. These tariffs were originally suspended from December 31st. Advances in rates on coal in carloads from mines in Kentucky and West Virginia to Milwaukee, until July 23d.

The Shipment of Explosives.

THE need for more stringent regulations governing the transportation of explosives, has led the Commission to announce that it would hold a public hearing on this subject May 26th at Washington. Shippers and carriers have been requested to submit to the Commission such changes in existing regulations as they deem desirable. It is the purpose of the Commission to enforce regulations that will minimize the danger to life and property in the transportation of all dangerous commodities.

ELECTIONS AND APPOINTMENTS.

Executive.

Horace E. Andrews, director, Missouri, Kansas & Texas Railway.

J. J. Bernet, vice-president, Lake Shore & Michigan Southern, Lake Erie & Western, Cleveland, Cincinnati, Chicago & St. Louis, Michigan Central, Peoria & Eastern, Cincinnati Northern, Chicago, Indiana & Southern and the Indiana Harbor Belt. Headquarters, Chicago.

J. B. Berry, assistant to the president, Chicago, Rock Island & Pacific.

A. J. County, director, Long Island Railroad.

F. H. Davis, director, Missouri, Kansas & Texas Railway.

Digitized by Google

C. B. Ferry, vice-president, Chicago, Milwaukee & St. Paul. Headquarters, New York.

A. T. Hardin, vice-president in charge of co-operation, maintenance and construction, New York Central & Hudson River and the Ottawa & New York. Headquarters, Grand Central Terminal, New York.

C. W. Harkness, director, Southern Pacific Company.

O. B. Huntsman, director, Texas & Pacific Railway.

H. L. Ingersoll, assistant to senior vice-president, New York Central Lines. Headquarters, New York.

L. F. Loree, director, Southern Pacific Company.

Lewis Lukes, assistant to president, Canadian Northern. Headquarters, Toronto, Ont.

Angus D. McDonald, vice-president and comptroller, Southern Pacific Company. Headquarters, New York.

William H. Manss, vice-president and general manager, Southern Settlement and Development Association. Headquarters, Baltimore.

J. P. Morgan, Jr., director, New York Central & Hudson River Railroad.

Percival Roberts, Jr., director. Long Island Railroad Co.

Finley J. Shepard, member executive committee, St. Louis, Iron Mountain and Southern Railroad, also director Texas & Pacific Railway.

M. W. Wells, assistant to president, Chicago, Terre Haute & Southeastern. Headquarters, Chicago.

C. N. Whitehead, assistant to president, Missouri, Kansas and Texas. Headquarters, St. Louis, Mo.

Joseph Wood, director, Pennsylvania Railroad.

Legal.

Joseph W. Jamison, general attorney, Missouri, Kansas & Texas. Headquarters, St. Louis, Mo.

H. A. Scandrett, interstate commerce attorney, Union Pacific, Oregon Short Line and Oregon-Washington Railroad & Navigation Company. Headquarters, Omaha, Neb.

Financial.

Frank Johnson, treasurer, Missouri, Kansas & Texas. Headquarters, St. Louis, Mo.

Carl Remington, secretary, Chesapeake & Ohio and the Hocking Valley. Headquarters, New York.

Accounting.

G. J. Bunting, assistant general auditor, Chicago, Milwaukee & St. Paul. Headquarters, Chicago.

M. A. Chambers, auditor and freight claim agent, Chicago, Memphis & Gulf Railroad. Headquarters, Dyersburg, Tenn.

E. C. Danforth, acting auditor and cashier, St. Joseph and Grand Island. Headquarters, St. Joseph.

R. N. Dudley, ticket auditor, Chicago, Milwaukee & St. Paul. Headquarters, Chicago.

Alfred S. Dutton, auditor of freight accounts, Detroit Terminal Railroad. Headquarters, Detroit, Mich.

W. M. Harvey, auditor of material accounts, Chicago, Milwaukee & St. Paul. Headquarters, Chicago.

A. D. McDonald, comptroller, Southern Pacific Company.

T. J. Foley, general manager, Chicago, Memphis & Gulf R. R. Headquarters, Chicago, Ill.

Charles Forrester, superintendent, Stratford Division, Grand Trunk. Headquarters, Stratford, Ont.

E. J. Gibson, superintendent, Iowa Division, Chicago, Rock Island & Pacific. Headquarters, Des Moines.

J. R. Hamilton, terminal trainmaster, Delaware, Lackawanna & Western. Headquarters, Buffalo, N. Y.

Patrick K. Hanley, trainmaster, Clinton, Havana and Decatur Districts, Illinois Central. Headquarters, Clinton, Ill.

F. J. Hawn, superintendent, Ft. Worth Division, St. Louis Southwestern of Texas. Headquarters, Mt. Pleasant, Texas.

J. F. Hickey, superintendent, Smithville District. Missouri, Kansas & Texas. Headquarters, Smithville, Texas.

Fred Hooker, superintendent of locomotive fuel service, St. Louis, Brownsville & Mexico. Headquarters, Kingsville, Texas.

B. G. Horton, superintendent of locomotive fuel service, New Orleans, Texas & Mexico. Headquarters, De Quincy, La.

W. D. Jenkins, inspector of transportation and stations of the International & Great Northern Railway, and the Texas & Pacific Railway. Headquarters, New Orleans, La.

H. E. Jones, assistant superintendent, San Antonio & Aransas Pass. Headquarters, Yoakum, Texas.

M. J. Kelley, superintendent, Chicago, West Pullman & Southern. Headquarters, Chicago.

W. L. Kellogg, superintendent, motive power, M. K. & T. Railway of Texas. Headquarters, Denison, Texas.

William E. Morris, general manager, Denver, Northwestern & Pacific. Headquarters, Denver, Colo.

William Mosby, superintendent of transportation, St. Louis Southwestern. Headquarters, Tyler, Texas.

John C. Muir, general superintendent, Chicago, Terre Haute & Southeastern Ry. Headquarters, Terre Haute, Ind.

M. A. Phillips, secretary to manager, Queen and Crescent Dispatch.

J. P. Pickering, superintendent of car service, Rock Island Lines. Headquarters, Chicago.

J. F. Porterfield, general superintendent, Chicago, Memphis & Gulf Railroad. Headquarters, New Orleans, La.

E. Richards, superintendent, St. Louis Southwestern Railway. Headquarters, Pine Bluff, Ark.

J. H. Rightmeyer, superintendent and car accountant, Kentucky and Indiana Terminal Railroad. Headquarters, Louisville, Ky.

D. H. Ryan, assistant superintendent, Dist. 1, Atlantic Division. Canadian Pacific. Headquarters, St. John, N. B.

Arthur B. Shafer, assistant superintendent, New York, Susquehanna & Western and the Wilkes-Barre & Eastern. Headquarters, Jersey City, N. J.

C. F. Smith, superintendent, Montana Division, Oregon Short Line. Headquarters, Pocatello, Idaho.

R. W. Stevens, superintendent, Chicago & Western Indiana. Headquarters, Chicago.

O. Tefteller, superintendent of locomotive fuel service, St. Louis, Brownsville & Mexico. Headquarters, Kingsville, Texas.

H. P. Thrall, inspector of transportation service, Southern Pacific Company. Headquarters, San Francisco, Cal.

R. H. Tuttle, superintendent, Albuquerque Division, Atchison, Topeka & Santa Fe Coast Lines.

W. H. Wallace, trainmaster, Pere Marquette Railroad. Headquarters, Plymouth, Mich.

J. M. Warner, general manager, Chicago & Western Indiana. Headquarters, Chicago.

B. Weeks, superintendent telegraph, Chicago, Memphis & Gulf Railroad. Headquarters, Memphis, Tenn.

Hugh Wilson, assistant superintendent. Northwestern Pacific Railroad.

Traffic.

C. M. Agnew, traveling freight agent, the Southern. Headquarters, Omaha, Nebraska.

D. W. Agnew, commercial agent, Georgia Southern & Florida. Headquarters, Valdosta, Ga.

W. A. Barrows, assistant general freight agent, Boston and Albany. Headquarters, Boston, Mass.

George A. Bergen, coal traffic manager, Erie Railroad. Headquarters, New York City.

W. J. Berger, general agent, passenger department, Chicago, Burlington & Quincy. Headquarters, New York.

A. C. Bernard, chief clerk in freight offices, Illinois Central. Headquarters, Pittsburgh, Pa.

George A. Blair, assistant freight traffic manager, Chicago, Milwaukee & St. Paul. Headquarters, Chicago, Ill.

Warren Brown, general agent, El Paso & Southwestern. Headquarters, Memphis, Tenn.

William Callanan, division freight agent, Boston & Albany. Headquarters, Worcester, Mass.

W. T. Carroll, assistant freight auditor, Chicago, Milwaukee & St. Paul.

M. A. Chambers, auditor and freight claims agent, Chicago, Memphis and Gulf. Headquarters, Dyersburg, Tenn.

T. P. Clemow, general agent, Great Northern. Headquarters, Billings, Mont.

E. B. Coolidge, general coal and ore agent, Wheeling & Lake Erie. Headquarters, Cleveland, Ohio.

R. H. Crozier, assistant general passenger agent, Spokane, Portland & Seattle, Oregon Electric, Oregon Trunk and United Railways. Headquarters, Portland, Oregon.

C. T. Dabney, soliciting freight agent, Georgia Southern & Florida. Headquarters, Cincinnati, Ohio.

R. H. DeTreville, city passenger and ticket agent, Louisville and Nashville. Headquarters, Evansville, Ind.

W. C. Elmer, traveling passenger agent, Canadian Pacific Railway. Headquarters, Toronto, Ont.

W. H. Emerson, acting freight claim agent, the Chicago & Eastern Illinois. Headquarters, Auburn Park, (Chicago), Ill.

A. Engelhardt, traveling freight agent, Delaware & Hudson Company. Headquarters, Pittsburgh. Pa.

F. H. Erhart, traveling freight agent, Illinois Central and the Yazoo & Mississippi Valley. Headquarters, Kansas City, Mo.

John F. Penn, chief of the special agents, Georgia, Southern and Florida.

ORGANIZATION NOTES.

Chicago Traffic Club's New President.

GUY S. McCABE, general western freight agent of the Pennsylvania Railroad, has been unanimously elected president of the Traffic Club of Chicago. Mr. McCabe is a charter member of the Club, and from the first has been one of the most active in promoting its continuous growth and welfare. He served as chairman of the House Committee in 1909-1910, and for the past three years has been secretary.

He was born July 23, 1873, at Sewickley, Pa., and began his railway service in 1889 as clerk in the general freight office of the Pittsburgh, Cincinnati and St. Louis, and the Chicago, St. Louis and Pittsburgh, afterward consolidated as the Pittsburgh, Chicago, Cincinnati and St. Louis Railway, at Columbus, O. For two years he was clerk in the division freight office at Richmond, Ind., from 1896 to 1903, traveling freight agent, 1903 to April 1, 1908, division freight agent at Richmond, and from April 1, 1908, to May 31, 1910, general western and division freight agent at Chicago. On June 1, 1910, he was appointed to his present position as general western and di-

GUY S. McCABE, RECENTLY ELECTED PRESIDENT OF THE CHICAGO TRAFFIC CLUB.

Digitized by Google

vision freight agent of the Pennsylvania Company in charge of the Chicago terminal division.

Other officers elected were: First, vice-president, W. M. Hopkins, manager traffic department, Chicago Board of Trade; second vice-president, Frank W. Smith, member Uniform Classification Committee; third vice-president, L. Richards, traffic manager, Quaker Oats Company; secretary, W. H. Wharton, commercial agent, Nashville, Chattanooga and St. Louis Railway; treasurer, Charles B. Hopper, general freight agent, Goodrich Transit Company.

Meeting of Western Classification Committee.—During the past month the Western Classification Committee has been holding a series of meetings in St. Louis for the purpose of readjusting various freight classifications. Among those present were a large number of shippers, railway officials from various parts of the territory affected, and representatives of State and Interstate Commissions. This is the first meeting of the Committee called in eighteen months and the docket to be disposed of included about 600 subjects, involving changes in freight classifications resulting in both advances and reductions in rates. All interested parties were given full opportunity to be heard.

Monthly Meeting of New York Railroad Club.—The regular monthly meeting of the New York Railroad Club, for April, occurred on the evening of the 18th and was addressed by William J. Cunningham, assistant professor of transportation, Harvard University, on: "The Administration of the State Railways of Prussia-Hesse." Mr. Cunningham's paper was based on personal observation and study.

Illinois Full Crew Bill Opposed.—Members of the executive committee of the Chicago Association of Commerce have adopted a resolution in which they express the opinion that the enactment of a bill now pending in the Illinois Senate would place upon the railroads operating under the provisions of the proposed act an unfair burden.

The proposed law provides that it will be illegal to run outside of yard limits any freight train consisting of fifty cars or more, excluding a caboose and engine, with less than a full crew, comprising a conductor, engineer, fireman, two brakemen and a flagman. There also is a rule that the crew on trains of less than fifty freight cars shall consist of a conductor, engineer, fireman, brakeman and flagman.

The bill further sets forth that it will be unlawful for a railroad to operate a passenger, mail or express train of five or more cars with a crew of less than an engineer, fireman, conductor, brakeman and flagman.

Illinois Organization Advocates New Shipping Laws.—The Illinois Consumers' and Shippers' Association, is advocating the enactment of laws in Illinois which will give greater protection to shippers and consumers. A statement issued by officials of the organization sets forth that the association is endeavoring to obtain needed regulations relative to the settlement of claims against railroads, weighing of cars, fees for attorneys, reciprocal demurrage, time movement and railroad incorporation. Statutes governing these matters, it is pointed out, are now in effect in Kansas, Oklahoma, Texas, Nebraska, Minnesota and various other States.

Meeting of General Baggage Agents.—At a meeting of the Western Association of General Baggage Agents, held in St. Louis last month, the following subjects docketed for the spring meeting were discussed:

Recommendation that size, weight and free allowance on emigrant, around-the-world and trans-Pacific baggage be the same as domestic baggage; scaling baggage; telegraphing for baggage; final action on resolution changing Article 3 of Constitution; question as to where line may be drawn in matter of handling public entertainment paraphernalia; discipline of train baggagemen; how and by whom administered; joint express messenger and train baggagemen; straight train baggagemen; for failure to make proper reports, mishandling United States mail, etc.; question of storing unclaimed baggage.

Meeting of Freight Traffic Officers.—At a recent meeting of the Executive Committee, American Association of Freight Traffic Officers, it was decided to hold the ninth regular annual meeting at Washington, D.C., Thursday and Friday, May 15th and 16th. Members are requested to forward the secretary-treasurer promptly a list of subjects which they may wish considered and same will be tabulated and distributed to members (in accordance with provision of section 12 of the by-laws), not later than April 16th, in connection with the final call for the meeting.

Arrangements will be made for a banquet on the evening of May 15th, and it is hoped that all members who can arrange to do so will honor the affair with their presence.

Meeting of the American Society of Mechanical Engineers.—On April 8th, the American Society of Mechanical Engineers held a meeting for the purpose of discussing steel passenger car design. The meeting brought before the Society the latest developments of the art by specialists in each feature of steel passenger car design.

The Terminal Railroad Association Election in St. Louis.—At the annual meeting of the stockholders of the Terminal Railroad Association of St. Louis, held on April 15th, directors were elected as follows: C. E. Schaff, representing the Missouri, Kansas and Texas Railway Company; F. H. Britton, St. Louis Southwestern; B. F. Bush, Missouri Pacific; George E. Evans, Louisville and Nashville; W. C. Loree, Baltimore and Ohio Southwestern Railroad; Henry Miller, Wabash Railroad; A. M. Schoyer, Vandalia Railroad; B. A. Worthington, Chicago and Alton Railroad; W. C. Nixon, St. Louis and San Francisco; E. J. Pearson, St. Louis, Iron Mountain and Southern; Thomas C. Powell, Southern Railway; W. L. Park, Illinois Central Railroad; A. E. Sweet, Rock Island; J. Q. Van Winkle, Big Four; E. P. Bracken, Burlington; W. S. McChesney, Jr., Terminal Railroad Association.

At a meeting of the board held later in the day officers and committees were elected, as follows: Julius S. Walsh, chairman of the board; W. S. McChesney, Jr., president; I. L. Burlingame, general manager; C. A. Vinnedge,

Digitized by Google

secretary and auditor; Julius S. Walsh, Jr., assistant secretary; Fred C. Daab, treasurer.

Finance Committee—B. A. Worthington, B. F. Bush, W. L. Park, Julius S. Walsh, chairman and ex-officio member.

Executive Committee—C. E. Schaff, T. C. Powell, Henry Miller, E. J. Pearson, George E. Evans, A. M. Schoyer, W. C. Nixon, W. S. McChesney, Jr., chairman and ex-officio member.

The board approved the recommendation of President McChesney and elected General Superintendent Burlingame as general manager. The office of general superintendent is abolished.

Railway Storekeepers to Meet.—Members of the Railway Storekeepers' Association will hold their tenth annual convention at the Hotel Sherman, Chicago, May 19th to 21st. A special committee has been appointed to prepare a book of standard rules governing store department practices. J. P. Murphy, Collinwood, Ohio, secretary of the organization.

Average Demurrage Plan for Canada.—The Canadian Manufacturers' Association, representing most of the large shippers of Canada, is preparing an application to the Board of Railway Commissioners for an order approving and making effective the average demurrage plan on all the Canadian roads under the jurisdiction of the Board. There is a widespread demand for the adoption of the plan. The applicants have made a study of the plan where it is in operation in the United States as a part of the national car rules and they claim that it works well there. The Board of Railway Commissioners has sent out a notice requiring the railways to show cause at the April hearing why an order should not be made calling for the publication of joint tariffs between points in Canada where such have not already been published has been struck off the calendar. No explanation is given for the action.

Meeting of the Railway Club of Pittsburgh.—At the monthly meeting of the Railway Club of Pittsburgh, held on April 25th, Walter V. Turner, chief engineer and P. H. Donovan, mechanical engineer of the Westinghouse Air Brake Company, read papers on the effect of changed operating conditions and modern rolling stock on the brake and what is being done to make this money saving or money losing apparatus as efficient as heretofore.

Meeting of St. Louis Railway Club.—At the monthly meeting of the St. Louis Railway Club, held on April 11th, J. R. Cavanaugh, superintendent of freight terminals of the Big Four Line at Indianapolis, delivered an address on: "Package Car, or the Handling of Less than Carload Freight." This is a subject of general interest to car accounting and transportation officers.

United States Commerce Association.—There has recently been organized at Chicago, an association known as the United States Commerce Association, whose object is to promote a practical knowledge of commerce, transportation and freight traffic efficiency, including not only domestic but export and import trade. This organization is to carry on research work without prejudice or regard to the special interests of railroads or industries, and to generally assist in the elevation of the traffic profession. It is the hope that the association will become a National Forum in which practical traffic men can trade their experience and technical knowledge with each other. The association has recently prepared a leaflet fully setting forth its object, membership, etc., which can be procured by addressing the United States Commerce Association, 39 West Adams Street, Chicago. It is asserted that all those interested in the increase and diffusion of a practical knowledge of interstate commerce, traffic work, trade and transportation, should become members of this organization.

Meeting of the Railway Development Association.—The annual meeting of the Railway Development Association will be held in Nashville, Tennessee on May 6th and 7th. The membership of this association is composed of the various departments, industrial, agricultural and immigration, of all American railroads. Its purposes are to develop America. The men who will be present at this meeting are trained experts who are making a scientific study of the resources and possibilities along their lines, and devising means by which they may be best exploited and developed.

Among the subjects that will be discussed at this meeting will be: "Agricultural Development," "Efficiency of Advertising," "Reclamation of Wet Lands by Drainage," "Prevention of Damage by Floods," "Operation of Special Trains in the Interest of Good Roads, Agriculture, etc."; "Immigration." "Relation of the Railroad to the New Settler," "The Efficiency of Centralized Plants," "Industrial Buildings, Warehouses, etc."; and "Industrial Development."

Dinner of New York Economic Club.—At a recent dinner of the New York Economic Club, held at the Hotel Astor on the evening, of April 29th, the subject: "Are Our Railroads Fairly Treated?" was discussed by the following prominent men: W. C. Brown, president of New York Central; A. B. Garretson, president of the Order of Railway Conductors of America; Benjamin F. Bush, president of the Missouri Pacific, and Prof. William Z. Ripley, of Harvard University.

Dinner of Pittsburgh Traffic Club.—At a dinner of the Pittsburgh Traffic Club, held on the evening of April 14th, an interesting lecture was delivered by H. B. Yergerson, on the details of steel making, under the title "From Mine to Mold." Moving pictures illustrated the address which was one of the most interesting ever delivered before this organization. The pictures showed steam shovels at work 250 feet below the surface and the loading of trains on five different levels. The great ore docks at Duluth and those at Mesabe were displayed in full operation and the mammoth freighters were shown receiving their southbound freight of ore and returning with their great burdens of coal. All of the various details of the loading and unloading of the boats were displayed.

At the conclusion of the entertainment features a closed meeting was held for members only, and the election of a Nominating Committee was

Digitized by Google

made, comprising G. G. Herring, G. A., Southern Pacific Railway Company; F. A. Ogden, D. F. A., Jones & Laughlin Steel Company; C. L. Cordes, D. F. A., American Steel & Wire Company; Robert Main, D. F. A., Canadian Pacific Railway, Soo Line; L. C. Bihler, T. M., Carnegie Steel Company; C. S. Belsterling, T. M., American Bridge Company; J. C. Kimes, C. F. A., Baltimore & Ohio R. R. Co. This committee will select candidates for different offices to be voted upon at the Club's annual election, June next.

STATE COMMISSIONS.

California.—In a recent decision, the Railroad Commission holds that public utility rates fixed by contract cannot stand against rates fixed by the Railroad Commission. The principal points covered in the decision may be summarized as follows:

All contracts made by a public utility will not stand when this Commission has fixed rates, but this Commission may adopt the rates fixed by contract if made under fair conditions, as far as it may do so without bringing about discrimination, and it specifically instructs untilities that they are not to repudiate their contracts until the matter has been presented to this Commission.

In the matter of the preparation of monthly statements of selected commodities by all railroads operating within the State, the Commission has amended its general order No. 29 to the effect that such statements shall, in the future, be submitted annually, instead of monthly, and that the first statement under the amended order shall be for the period of October 1, 1912 to June 1, 1913, and annually thereafter for each fiscal year.

Colorado.—An appeal is to be lodged against an order of the State Railway Commission on which directs the railroads operating in the northern Colorado coal fields to reduce their rates on coal to Denver. This action has been decided upon as the result of a conference in Denver of the legal and traffic officials of the Chicago, Burlington & Quincy, and the Colorado & Southern Railroads.

By order of the Commission, the railroads are directed to put into effect, on April 20th, a new tariff reducing from 80 to 50 cents per ton, the rate on lump coal from the northern fields to Denver, and to place proportionately lower rates on mine run and slack.

Three years ago the Commission ordered the rates reduced in the case of the Colorado Consumers' League. The railroads carried the matter to the State Supreme Court, which upheld the Commission. This order in the Consumers' League case expired in May, 1912.

Iowa.—The Railroad Commission will hold a general rate and classification hearing at Des Moines on May 14th, and a special hearing on the subject of demurrage rules on May 13th. The questions to be considered are, proposed changes in the Iowa rules, to agree with the interstate rules now in effect, and a proposed increase in the demurrage charge from $1 to $3.

Illinois.—The Railroad and Warehouse Commission has entered an order restraining the Chicago, Milwaukee and St. Paul Railroad from increasing its tariff on coal by raising its rates for switching. Some time ago the St. Paul announced that it would increase its switching charges over its terminals at Chicago. This decision was immediately followed by the announcement from other roads that they would increase their rates in order to make up for the increase in switching charges they would have to pay when using the St. Paul's terminals. The State Commission says that the railroads must adjust their rates so that they shall not exceed the limit fixed in the tariff of August 1, 1911.

Proposed advances in grain by the Atchison and several other lines, have been suspended by the Commission until July 31st, next. A complaint against the contemplated increases was filed with the Interstate Commerce Commission some time ago and a decision on the question is expected from the latter tribunal within a short time. Continuances were granted by the Commission in a number of cases involving better protection at railroad grade crossings.

According to a report just issued by the Commission, there was a decrease of 46 fatalities on steam and electric roads in Illinois for the fiscal year ending June 30, 1912, as compared with the previous year, according to the report of the Illinois Railroad and Warehouse Commission. The report shows that 900 passengers, employes and other persons were killed on the steam roads, while 65 met death on electric lines, including elevated.

The total number of persons injured during the year on all passenger-carrying roads was 13,593, an increase of 1,729 over the previous year. Of this number, 1,095 were injured on the surface and electric lines and 12,498 were injured on the steam roads.

Louisiana.—As a result of an investigation by the Railroad Commission into numerous accidents that have occurred throughout the State during the past several years, the railroads have been ordered to show why an order shall not be issued requiring all railroads operating in Louisiana, except those less than twenty-five miles in length, or upon which only one train each way per day is operated, to operate their trains on an improved block system. It is not the intention of the Commission to prescribe what system shall be used but to develop some plan by which trains shall be kept at least three miles apart instead of under the present system of keeping them so many minutes apart.

The Commission has given notice that it will soon begin an extensive investigation regarding the necessity for a readjustment of rates on carloads and less than carloads, on petroleum and its products, between points in Louisiana.

Maryland.—The Public Service Commission has issued a ruling to the effect that the railroads must not sidetrack local passenger trains in Maryland to allow belated through passenger trains to pass. The railroad officials contend that the Commission has no authority to issue an order that might interfere with the running of its through trains engaged in interstate traffic. The Commission takes the ground that the time set on the schedule for the local train belongs to it when it is running on that time and not to a belated express train. In brief, that the

Digitized by Google

rights of the passengers traveling wholly within the State are equal to those of the passengers without the State and that the railroad's timetable, in this respect, is its contract with its passengers.

The Commission has again heard arguments in the switching charge cases recently brought before Judge Duffy, of Baltimore, on injunction proceedings. The Court made the injunction permanent on many points which prevented the Commission from carrying out its order against the railroads.

All the railroads centering in Baltimore are involved.

According to a report filed with the Public Service Commission, the Western Maryland Railway Company has expended up to February 28th last, $14,330,667 in constructing its new line from Cumberland to Pittsburgh.

New York.—The Public Service Commission has approved the application of the New York Central, the Rome, Watertown & Ogdenburg, the Utica and Black River, the Oswego and Rome, the Carthage, Watertown and Sackets Harbor and the Niagara Falls branch and the Little Falls and Dolgeville railroad companies for leave to consolidate under the name of "The New York Central & Hudson River Railroad."

The capital stock of the corporation is $225,581,100.

Of 6,373 locomotives in service on railroads in New York, during the past year, 4,213 have been inspected by the representatives of the Public Service Commission, second district. Approximately ninety per cent of these were either on the road or available for service, the remainder being in the shops awaiting repairs.

With respect to unsatisfactory motive power conditions on the New York Central a year ago, due to labor troubles and a shortage of power, the Commission states that an agreement made then has been strictly followed as a result of which the conditions in question have been greatly improved and are now entirely satisfactory.

One would think, to listen to some New England denunciators of the New Haven road, that late trains and wrecks held the record on this system. The official record, however, does not bear out the attacks, and travelers from over the country say the New Haven is more on time than any other road.

The Public Service Commission of New York has compiled the figures on delayed passenger trains for the month of January.

The New York Central, out of 26,144 trains, had 18 per cent late, with an average lateness of all trains run of 5½ minutes.

The Erie, with 7,417 passenger trains, had 18 per cent late, and an average lateness of all trains run of 5.3 minutes.

The New York, New Haven & Hartford R. R. stands third on the list for the number of trains moved, and of its 5,432 passenger trains reported to the New York Public Service Commission, only 17 per cent were late in January, and the average lateness for all trains run was but 2.8 minutes.

Pennsylvania.—The State Railroad Commission has certified to the attorney general for court action complaints against the Erie Railroad Company. The practice of the company is to compel a passenger, from whom an excess charge of ten cents is collected on a train, to send the cash fare slips representing the amount of the excess charge to the New York office for redemption.

The Commission recommended that this fare be returned to the passenger upon presentation of the coupon to any of the agencies of the company in this State. The Erie replied that it did not propose to change its practice.

Texas.—The State Railroad Commission has issued an order amending the rules and regulations governing the switching of loaded cars. It also applies on intercity movements of empty cars for purposes other than loading or unloading. The amendment reads:

"Terminal switching service shall, in all cases, be furnished when demanded at the charges provided in this tariff and regardless of whether the freight transported, or to be transported, is of carload or less than carload quantity, provided the aggregate weight is not less than 6,000 pounds, and said charges shall in all cases, be absorbed by the line or lines of railway performing the transportation haul on the freight switched out of the freight charges accruing under the authorized freight rate applicable for the transportation of the commodity or commodities shipped between origin and destination stations, provided that the net transportation charge shall not in any case, by such absorption be reduced below $7.50 per car. This minimum of $7.50 per car will not be observed where the transportation haul is performed by the switching line."

LEGISLATION.

National.—As reported elsewhere, the bulk of the time of our national legislation during the past month, particularly in the House of Representatives, was given to the tariff bill, which, in general public interest, transcends all other matters.

Some legislation, however, has been proposed or passed of interest to railroad officials. A bill which has recently become a law, and which imposes a maximum fine of $5,000 or imprisonment for not more than ten years for any person convicted of unlawfully breaking into any railway car containing interstate shipments or of stealing or obtaining by fraud or deception, from any car depot, platform, vessel or wharf, any freight which constitutes or is a part of any interstate or foreign shipment, should make far more difficult and dangerous, in the future, the operations of car and depot thieves.

In the House of Representatives, Representative Sims, of Tennessee has re-introduced his bill providing for the repeal of the "free tolls" provision of the Panama Canal Act. Several bills amending the Sherman law are in contemplation, and one has already been introduced by Representative Baker, of California, and has been referred to the judiciary committee. It is not expected, however, that interstate legislation will engage much of the attention of the extra session.

The Raker bill would specifically define the law and public policy of the Government with respect to combinations. Combinations in restraint of trade would be defined as arrangements without exception, limitation or qualification, be-

Digitized by Google

tween two or more persons which in any way or to any extent limit competition or the freedom to compete a trade, or which create a dangerous probability "that the totality of a national trade shall be decreased for private profit." Such combinations in which unlawful means are used to further the purpose of combination would be classed as conspiracies.

Representative Sims has also introduced a bill providing for the abolition of the Commerce Court. Some action will have to be taken regarding this Court soon. The appropriation continuing the Court expires on July 1st next, after which it goes out of existence for lack of subsistence unless provision is made extending its life. Meanwhile, no arrangements have been made by law as to what court is to have the jurisdiction over the legal matters now coming up before the present Commerce Court. The whole matter apparently rests with President Wilson as it is likely that his position will have an important influence as to whether the Court shall be continued or abolished.

In the Senate, Senator Newlands, of Nevada, has announced that he intends to push his river regulation and flood provision bill which is now pending in Congress, to an early date. Senator Newlands has also re-introduced his interstate trade commission bill which has been referred to in previous issues of the "Railway World."

Senator Cummings has introduced a bill designed to prevent interstate railroads from limiting their liability in case of loss of shipments. It was prepared to meet recent decisions of the Supreme Court, which have the effect of limiting liability if lower rates are accepted by shippers.

Senator Gronna has introduced and had referred to the Committee on Interstate Commerce, a bill providing for a further amendment of the Interstate Commerce Act, by granting the Commission power to regulate the speed with which railroads must deliver freight.

The Southerland workingmen's compensation bill has also been introduced in the Senate, with a provision for a minimum compensation of $25 per month and no fixed maximum. Many of the House amendments of the original measure prepared by the Southerland Commission are included.

In a resolution adopted by the Senate, the Secretary of the Treasury is required to report whether express companies have been paid by the Government for transporting government property over lines on railroads which have received land grants from the Government on the condition that all such property shall be conveyed at the cost of the roads.

Representative Henry, of Texas, has re-introduced a bill to amend the Sherman anti-trust law. He proposes three important changes. These include a provision to define more accurately the acts constituting trust or monopoly in restraint of trade, a second provision making all persons who conspire to monopolize trade guilty of a felony and punishable by imprisonment and a third provision nullifying the "rule of reason" written into the law by the Supreme Court of the United States.

Colorado.—A bill has been introduced in the Colorado Legislature which provides that all roads, with the exception of those of sixteen miles or less in length, shall equip their engines with headlights of not less than 1,200 candle power. The cost of the railroads is estimated at $160,000.

Connecticut.—The bill passed by the legislature, providing all railroad ticket agents to issue free tickets to the members of the legislature, and which was promptly vetoed by Governor Baldwin, failed to be repassed by a vote of 154 to 39.

Illinois.—The chairman of the Legislative Board of the Brotherhood of Locomotive Engineers, is seeking the enactment of a law to install high power headlights on engines in Illinois.

A resolution has been introduced into the Legislature, calling for an investigation of the affairs of the Illinois Central Railroad Company to determine exactly what percentage of the profits of that railroad's earnings is due to the State.

In the State Senate, a bill has been introduced to prepare for the building of a union freight and passenger station near the present Union Station and in substitution therefor. The proposed enabling act amends the present union station statute, adopted in 1874, to provide that companies formed for the purpose of building the projected union station may have $50,000,000 capitalization, instead of the present limit of $3,000,000. Senator O'Connor says that his bill is in the interest of the Pennsylvania, Burlington, St. Paul and Alton and incidentally of all roads concerned in case the Chicago authorities should compel construction of a great union station south of Twelfth street, near the Illinois Central terminal, in accordance with the so-called "city beautiful plan."

Massachusetts.—A bill establishing a new public service commission of five members having control of railroad, street railways, telegraph and telephone lines of the State, has been approved by the House Committee on Ways and Means. The bill abolishes the present railroad commission, and many of its provisions follow closely those of the Interstate Commerce Commission Act.

Missouri.—The Legislature has passed a bill abolishing the office of railroad commissioner and creating that of warehouse commissioner with a salary of $4,500. It was forced by a threat to withhold an appropriation for grain inspection which was then provided to the amount of $125,000.

Governor Major has signed a bill which requires foreign railroads to incorporate in Missouri as a condition of doing business in that State, and another requiring railroads to put three brakemen upon all freight trains of forty cars or more and a flagman and brakeman upon every passenger train of six coaches or more. The Governor takes the position that the bill requiring railroads to incorporate in Missouri does not, and cannot, consistently apply to foreign roads now doing business as in the State but only to roads which enter Missouri in the future. Apparently the legislative intent was to make this measure applicable to foreign roads now in the State. The aim of this bill, as indicated by arguments in its behalf, is that it is intended

Digitized by Google

to prevent the roads from taking their cases into the federal courts for trial.

New York.—Three bills embodying the pledges made by the State platform of the progressive body to give additional powers to the Public Service Commission, have been introduced in the Legislature. They give the Commissions power similar to those exercised by the Interstate Commerce Commission over rate questions. They also propose to facilitate litigations involving decisions made by the Commissions.

The bills are also designed to bring railroad baggage and transfer companies under the direct jurisdiction of the commissions, by making them "common carriers," with a view to prohibiting such companies from charging exorbitant rates.

The Assembly has passed the Jones reciprocal demurrage bill, whereby the railroads are compelled to publish uniform demurrage rates and are to be charged back the same rates whenever they fail to deliver cars for shipments when ordered.

The Senate has adopted the Griffin concurrent resolution designed to submit to the voters of the State an amendment to the constitution permitting the enactment of a compulsory workmen's compensation law. The Griffin resolution would meet a recent decision by the Court of Appeals regarding the constitutionality of compulsory workmen's compensation legislation.

New Jersey.—A bill has been introduced in the Legislature, prohibiting a railroad from testing its engineers in the matter of signals without warning the engineers of the tests. This bill is vigorously opposed by the railroads who assert that an elementary and reasonable measure of efficiency and public protection will be destroyed if the bill is passed.

Pennsylvania.—A bill which was introduced in the Legislature for the purpose of licensing dining cars for the sale of liquors, has been defeated by a vote of 111 to 75.

New Hampshire.—The measure recommended by the Special Legislative Committee, which has been considering the railroad rate question in New Hampshire, has been rejected by the Legislature and the Committee has been instructed to report a new measure giving the Boston & Maine Railroad more liberal terms and the Railroad Commission more discretion in fixing rates. As reported by the committee, the bill would have required the Boston & Maine and the State to agree upon a new schedule of rates to be prepared by the Public Service Commission, and to go into effect July 1st of the present year, none of the rates to be in excess of those now charged. The resolution calling for a new bill was adopted 179 to 138.

Texas.—The Legislature at its recent session passed the following bills affecting railroads:

Making it a misdemeanor for railroad station agents to fail to bulletin properly the arrival and departure time of passenger trains authorizing the Missouri, Kansas & Texas to take over and operate several of its subsidiary lines; authorizing the Houston & Texas Central to purchase and operate the Hearne & Brazos Valley Railroad; authorizing the Texas & New Orleans to take over and operate the Burrs Berry, Browndel & Chester Railroad; authorizing the St. Louis Southwestern to take over the Stevensville North & South Texas Railroad; authorizing the Gulf, Colorado & Santa Fe to take over and operate its Pecos Valley lines; authorizing the El Paso Southwestern to take over and operate the El Paso & Northwestern Railroad; requiring railroads to equip all side tracks with derailing devices; extending the time for two years in which railroads may complete extensions of their lines as provided in their respective charters; a resolution directing the Attorney-General to investigate the St. Louis Southwestern Railroad's alleged violation of its charter provisions in not building an extension of its eastern Texas line from Lufkin to Crockett.

Governor Colquitt did not veto the Santa Fe consolidation bill to which he was opposed, but allowed it to become a law without his signature. He has, however, advised that attorney-general will notify the Santa Fe of whatever legal questions involved are dependent in their determination upon the result of a suit brought against the Missouri, Kansas & Texas in respect to its consolidation.

The same policy will be pursued if he decided to allow the Cotton Belt bill to become a law. He is of the opinion that the Santa Fe bill, as to lines consolidated, is less objectionable than was that of the Katy but the same question as to ownership of stocks and foreign railroad company, is involved.

Attorney-General B. F. Looney has drafted a bill which has for its purpose the prevention of the domination of Texas railroads by their outside ownership corporations, or parent lines. It is provided in the constitution of this State that no railroad company organized under Texas laws may consolidate with a company organized under the laws of any other State in the United States. The Texas statutes also require that all railroads in this State must be organized and operated under Texas charters. It has been held by the courts that the mere ownership of stocks or bonds of a Texas railroad by a foreign corporation does not violate the antimerger provision of the constitution.

LABOR.

The Inexhaustible Demands of Railway Labor.

THE labor situation, as indicated in another section of this issue, is rapidly assuming a threatening attitude and one which is giving railway managers the liveliest concern. Practically all classes of employes are clamoring for increased wages and with net earnings now insufficient to properly care for current demands and to attract the necessary capital to meet the constantly increasing demands of commerce, the point has apparently been reached where further compromise along these lines is impossible. The wage movements which now confront the Eastern carriers are probably more important than those of the engineers and firemen combined. Some hundred thousand conductors and trainmen on forty-three Eastern roads have made demands for increased wages and changes in working conditions. In spite of the fact that their wages were increased by $30,000,000 per annum in 1910,

Digitized by Google

they now ask for an additional $17,000,000 or 20 per cent per annum.

These demands have received careful consideration on the part of the carriers involved, and have been refused for the reasons set forth in the following letter:

MAY 1st, 1913.

Mr. A. B. Garrettson,
President, Order of Railway Conductors,
Mr. W. G. Lee.
President, Brotherhood of Railroad Trainmen.
Gentlemen:

The wages and working conditions which you request would increase the pay of 100,000 conductors and trainmen of the railroads in the Eastern District—the 43 roads represented by the Conference Committee of Managers—for the service now rendered by approximately $17,000,000 or 20 per cent per annum. The increase would be equivalent to placing on these properties a lien of $425,000,000 of four per cent securities, which would have preference over first mortgage bonds.

If the railroads are forced to pay extravagant wages to men in train service, the burden must fall on the public, for it is only from the 50,000,000 people directly dependent on these railroads for transportation facilities that the roads can secure revenue. You will readily see, therefore, why, in considering your demands, we hold the public interest paramount.

Already the traffic of a growing country has overtaxed the existing facilities; and the heavy burdens incurred through ill-advised legislation, such as extra-crew bills,—for which the Brotherhood of Railroad Trainmen is alone responsible—forcing on the railroads and consequently on the public, needless expenditures of millions of dollars annually, or the large financial outlay the roads are compelled by law to make for improvements which produce no revenue, such as the grade crossing bill of New Jersey, and the additional burden of previous wage increases. All of these factors are making it impossible for many of the roads to provide those facilities which prudent foresight demands, and which the interests of the public require.

In making demands for extravagant wages,—wages entirely out of accord with the railroads' obligations as a whole—railway employes apparently act on the assumption that a strike that would tie up traffic would never be permitted by the public. They seem to think that if a strike is to be avoided, the railroads must give way,—that the public will force them to give way, believing that arbitration must take place, and that in the end the splitting of differences between what they demand and the wages they receive will result in their favor. In other words, the employes have everything to gain and nothing to lose.

The ability of the railroads to meet the recurring demands for increased wages is measured by the net results of their operations and the sum of obligations which they must meet to maintain their solvency. The reduction of the net revenue by the constantly increasing expenses of operation have so narrowed the margin which is essential to the solvent existence of many of the roads that further increases in operating costs are viewed with grave concern.

The railroads reiterate their statement made to the engineers, that this headlong movement towards financial disaster cannot proceed unchecked.

The conductors and trainmen in the Eastern District have practically uniform wages and working conditions, and the wages now paid are liberal. As positive proof of this we need only call your attention to the fact that they were fixed by E. E. Clark, former President of the Order Railway Conductors and P. H. Morrissey, former President of the Brotherhood of Railroad Trainmen, who acted as arbitrators in the New York Central controversy in 1910.

The method of settlement under which those wages and conditions were adopted was agreed to only after representatives of the employes had declined to accept mediation or arbitration under the Federal Law, arbitration by a board composed of members of the Public Service Commission, Second District, State of New York, or arbitration by a board composed of the Presidents of the Chambers of Commerce of three prominent cities of the State of New York, or in fact, arbitration in any form. Therefore, to avoid suspension of traffic, and the hardships and inconveniences which would result, representatives of the New York Central Railroad offered the only method of settlement that the representatives of the employes would accept.

To prevent strikes on their lines, practically all of the railroads in the Eastern Territory in 1910 accepted the Clark-Morrissey Award.

The wages and working conditions of the conductors and trainmen, fixed by the New York Central Award, are probably more favorable than those of any other class of railway employes; and further, to quote the well-considered language of the Interstate Commerce Commission, "Railroad labor, certainly organized railroad labor, is probably as well paid, and some say better paid, than labor of other kinds upon the average."

As showing the increased cost to the Eastern Railroads of these adjustments in 1910, we need only quote the statement made by the President of the Brotherhood of Railroad Trainmen in his report of the Tenth Biennial Convention of that organization:

"Conservatively estimating, the increases in the rates of pay of Conductors, Trainmen and Yardmen in the East as a result of this movement will approximate $30,000,000 per annum."

No conditions of work have arisen since the application of the Clark-Morrissey Award that would warrant any increase in wages or changes in working conditions.

In view of the fact that the present rates of wages are liberal, and in many cases excessive, the Conference Committee of Managers, acting in the interests of owners of railroad securities, in the interests of all railroad employes,—in the interests of the public as a whole,—must decline your request.

(Signed) The Conference Committee
of Managers,
By Elisha Lee, Chairman.

TRAFFIC.

Traffic Developments for April.—It was not until well towards the middle of the month that the railways were able to resume interrupted traffic in the flooded districts. It is impossible to state the cost of the damage, as estimates vary to such a degree that even an approximate

Digitized by Google

figure cannot be given. It is well up into the millions, however, and it will still be several weeks before all repair work has been accomplished.

Roads in the west, northwest and southwest, which have not been affected by the floods, show by their loading reports and earnings, fair gains over last year, but the roads in the flooded districts will do well if they maintain their gain in earnings that they showed prior to the disaster.

Satisfactory reports are being received from traffic officials in various sections of the country and indications point to a continuation of liberal business. All roads except in the flooded district, are now working in better shape and with an abundance of cars. A prompt return of foreign cars is noted on many of the large systems. Merchandise traffic is showing a material enlargement as compared with last year, and the grain tonnage continues to show an increase. Merchants and manufacturers appear fairly busy, although business is inclined to go slowly on account of tariff developments.

One of the favorable developments of the month was the crop report of the United States Department of Agriculture, which shows an average condition of winter wheat on April 1st, of 91.6 per cent of a normal against 80.6 per cent on April 1st, 1912; 83.3 per cent on April 1, 1911, and 86.3 per cent, the average condition for the past ten years, on April 1st. This is the most encouraging grain report of years and points to a bumper crop and enormous tonnage for the railroads. Furthermore, little apprehension is felt over the condition of the winter wheat crop in the flooded sections, as practically the only loss in the acreage will be where there was a swift enough current to tear the plants up by the roots.

Figures of foreign commerce for the month of March show some indications of a decline. The total exports of the principal domestic products for the month were valued at $65,500,000 against $94,000,000 for the same month of last year, and $64,000,000 for March, 1911. Including all classes of merchandise the exports for March were valued at $187,000,000 as against $194,000,000 in February and $205,500,000 in March, 1912. The imports for March were $155,500,000 compared with $157,500,000 for the corresponding period of 1912.

Lake navigation has been resumed from both ends of the Great Lakes. The date for the opening of the Erie Canal will probably not be later than May 15th. On the Ohio and the upper Mississippi rivers, navigation is cleared and the waters have subsided enough to admit of the inauguration of regular freight service.

The lack of demand for anthracite coal, even at the prevailing reduced prices, was reflected in the falling off of anthracite shipments in March, which were 1,660,399 tons less than the shipments of March, 1912, and in the increase in the amount of coal on hand at tidewater shipping ports. The shipments in March, 1912, amounted to 6,569,687 tons; those in March, 1913, to 4,909,288. The coal on hand at tidewater shipping ports was 484,270 tons on February 28th and 772,115 tons at the close of March, an increase of 287,845 tons.

That the volume of summer passenger travel to both the Eastern and Western coasts will be unusually heavy during the coming season is the prediction of passenger traffic officials. There are a large number of conventions to be held in Atlantic Coast cities which are expected to attract many delegates and visitors. There also are numerous conventions scheduled to be held in various Western cities.

LEGAL.

Forwarding Agents Held Guiltless.—George W. Sheldon and Henry W. Ackhoff, composing the freight forwarding firm of Sheldon and Ackhoff, who have been on trial in the criminal branch of the United States District Court at New York on inditement charging the acceptance of rebates from the Lehigh Valley Railroad Company, have been discharged on the ground that the firm was in reality the agent of the railroad company, having been hired by the company, 25 years ago at a salary of $5,000 a year to get business for the company. The case did not go to the jury.

The effect of this decision will be to free all freight forwarders from charges of rebating. The overt acts charged against the defendants was that they accepted a commission of ten per cent from the Lehigh Valley Company for all foreign freight obtained by them for shipment to Chicago and other points West.

Judge James L. Martin in instructing the jury to render a verdict of "not guilty," said in part: "We are living in an age where it behooves everybody that is doing any interstate transportation business, to carefully look into things, and I have sometimes thought that the drift of legislation is to increase business for the lawyers, because I do not know how it is quite safe for anybody to ship anything across the State line without advice of counsel as to whether they are violating a law."

Railroad Combine in Texas Prohibited.—The Fifty-third District Court of Texas has granted a temporary order restraining the Missouri, Kansas & Texas Railroad and allied lines in this State from consolidating, as provided for in a bill passed by the Texas Legislature over the veto of the Governor. The petition, which seeks a permanent injunction and the forfeiture of the railroad's charter, asserts that the proposed consolidation would be in contravention of the State Constitution.

Claim Against Orient Road Compromised.—A claim of $1,045,000 against the Kansas City, Mexico & Orient Railway, held by the American Car & Foundry Company, has been compromised by the receivers of the road for $845,000. The claim was for the balance of $2,500,000 worth of rolling stock and supplies furnished the railroad since 1902. The settlement is regarded as an important step toward a reorganization of the Kansas City, Mexico & Orient Line.

St. Louis Coal Traffic Bureau Sued.—A suit has been filed in the Federal District Court at St. Louis against the St. Louis Coal Traffic Bureau to enjoin it from making railroad rates on coal carried from the Illinois mines to St. Louis and to dissolve the bureau as a combination in restraint of trade.

Railway World

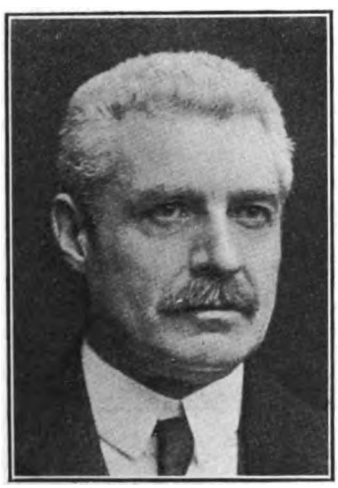
VOL. LVII. JUNE, 1913 No. 6

Important Developments in the Transportation Field

RAILWAY FACILITIES VERSUS FREIGHT RATES

In February, 1911 the Interstate Commerce Commission handed down its decision denying the petition of the trunk line railroads that they be allowed to make certain advances in their class rates. This petition was based upon two grounds. First, that the railroads were not earning a fair return upon the value of their property, and second, because the cost of operation would be increased by the increases granted in wages. The proof submitted by the railroads did not satisfy the Commission. In reaching a decision adverse to the carriers, the Commission claimed that in spite of the increases of wages, railway net earnings were the largest in the history of the country, and that the average rate of dividend paid and the proportion of stock-paying dividends, were the largest on record. The decision of the Commission was not, however, final. In handing down its rulings, the Commission made this significant statement: "We do not say that the carriers may not increase their income. We trust they may, and confidently believe they will. If the time does come when, through changed conditions, it may be shown that their fears are realized, or approaching realization, and from a survey of the whole field of operations there is evidence of a movement which makes against the security and lasting value of legitimate investment, and an adequate return upon the value of these properties, this Commission will not hesitate to give its sanction to increases which will be reasonable."

Relying upon this implied promise of the Interstate Commerce Commission, a committee of attorneys representing the Trunk Line railroads on May 15th, filed a petition for the reopening of the case for an increase in freight rates for the Eastern railroads. A general horizontal increase of 5 per cent on both class and commodity rates was asked for. Briefly summarized, the basis of the petition is as follows: First, the cost of conducting railroad business has been steadily increasing, by reason of increases in interest rates on new capital, wages, taxes, extra crew laws, employers' liability and compensation acts, elimination of grade crossings, and the installation of safety appliances. Second, existing rates are insufficient to afford a reasonable return to the carriers. Third, it will be necessary for the railroads to spend many millions of dollars in improving their facilities in order to satisfy the needs and demands of the public.



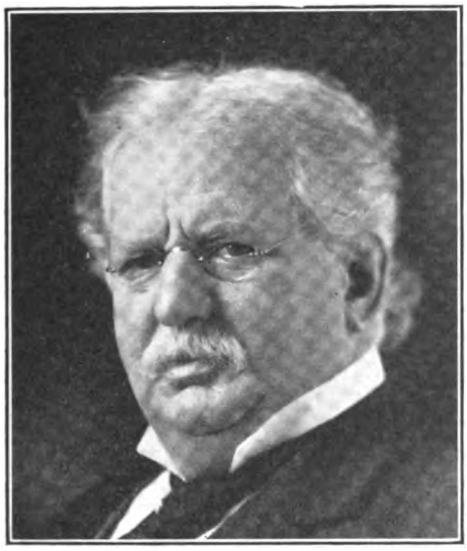
SAMUEL REA.
President, Pennsylvania Railroad.

DANIEL WILLARD.
President, Baltimore and Ohio Railroad.

W. C. BROWN.
President, New York Central Lines.

Committee of railway presidents representing the Eastern roads in their efforts to procure a 5 per cent increase in freight rates.

Digitized by Google



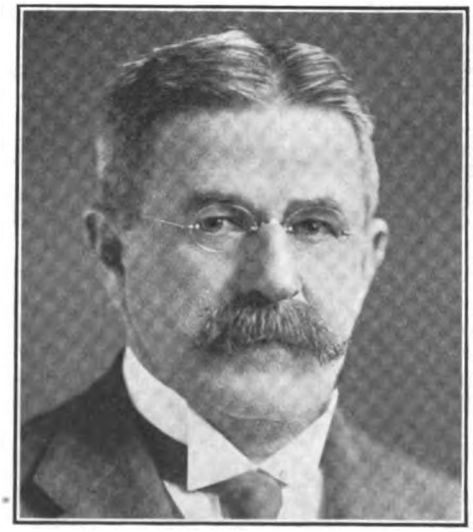
THEODORE N. VAIL,
President, American Telephone and Telegraph Company.

"The same business men who are trembling lest their factories will be closed because of textile tariff or other tariff alterations, have opposed a rational increase in railroad freight rates. And yet an increase in freight rates is the biggest thing which could possibly happen in this country to-day. The railroads need it, must have it. When they get it, and I feel morally certain they will get it, then their financing credit will be restored, their ability to grow and expand will be assured and this will work down along the line to every industrial town and city in the land."

Fourth, this money cannot be raised on terms which would be considered reasonable unless the margin of surplus earnings, which constitute the security of railroad obligations, shall be considerably increased. The petition finally concludes with a brief explanation of the 5 per cent basis of rate advances. A horizontal change of this character would work little disturbance of existing relations between classes of traffic and existing communities. For the same reason an advance is requested for commodity rates as well as for class rates.

One of the most forcible statements in support of the position taken by the railroads is contained in a communication by President Rea, of the Pennsylvania to the Philadelphia *Public Ledger*. President Rea shows that the increased revenue to the Trunk Lines, resulting from the increase asked for, would be about $40,000,000, or about $1 per head of the population in the territory affected. Railway expenses, he points out, have largely increased. The added cost of new legislation alone on the Pennsylvania Railroad east of Pittsburgh, from 1906 to 1912, was nearly $11,000,000. New laws are being constantly enacted which mean further increases in expense. The railroads do not question the wisdom of this legislation; they are anxious to obey the law and to conform to the requirements of public opinion in the methods by which they conduct their business.

It is impossible, however, for the railroads to meet this added expense, and also to pay the cost of new facilities, which growing traffic and the demands of the public for increased safety and expedition in railway traffic involve, without increasing the revenue from transportation. As President Rea points out, a refusal to admit the contention of the railroads that they should be allowed to charge higher freight rates, is equivalent to a declaration that a portion of the community composed of railway stockholders, which number in the case of the Pennsylvania alone nearly 100,000, should contribute of their property to the benefit of the rest of the people. Beyond this, however, without increased revenue, the new capital cannot be secured, and without new capital the demands of the public cannot be satisfied. The proposition, therefore, reduced to its lowest terms, in the opinion of the President of the Pennsylvania, is this: If the public wish certain definite improvements in their transportation systems they must make it possible for the railroads to get the money, with-



L. E. JOHNSON,
President, Norfolk and Western Railway.

"If the restricting legislation of the National Congress and the State Legislators of this country continues, and the never-ending demands of labor for increased compensation continue, there are but two finishing points—bankruptcy or government ownership."

JAMES SPEYER, BANKER.

"The people want fair play. Let them know all the facts and they will act fairly."

out which these improvements cannot be made.

President Willard, of the Baltimore and Ohio, in a communication addressed to the Merchants and Manufacturers Association of Baltimore, stated the contention of the railroads in another way. He pointed out that at the existing rates, it costs the shipper $1 to send a ton of freight 100 miles. All that the railroads ask is that the shipper pay $1.05 for this service.

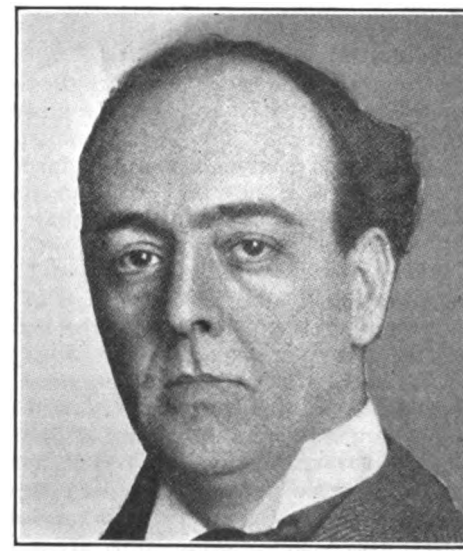
"In return for this slight concession the railroads will be in position to put their facilities in such shape as to better serve the shippers. This is the ground on which we will seek to get the general support for our efforts. It seems to us that an alert business man will readily agree to pay us this small addition if he knows that it is going to result in his having cars and motive power always available to move his goods. That it will enable us to do this and better provide for the country's growing needs is one of the grounds we will take in urging our case.

President L. E. Johnson, of the Norfolk and Western, in a statement issued in connection with legislation now pending in the Ohio Legislature, calls attention to the lack of security of new railroad issues. He points out that the railroads have now scarcely any collateral to offer the investor except the faith in their ability to earn money. "The money that railroads are forced to acquire now, and have been for the past several years, has been secured wholly upon the ability of the company to pay the interest on the money so obtained.

"If the restricting legislation of the national Congress and the state legislatures of this country continues, and the never-ending demands of labor for increased compensation continue, there are but two finishing points—bankruptcy or government ownership! This is a clean, hard fact, susceptible of proof and clearly demonstrated by results that are obtaining in foreign countries.

"In England the privately-owned corporations have reached a point where they must have reduced cost of operation or increased rate for transportation to pay fixed charges, with nothing left over for the stockholders. France and Germany have taken the other course and own and operate most of the railroads in those countries."

A more general survey of the situation, from the railroad point of view, was presented at a recent meeting of the Economic Club of New York. The subject for discussion was, "Are Our Railroads Fairly Treated?" The presiding officer, Mr. James Speyer, the president of the Club, took advanced ground in favor of the railway regulation which, he claimed, has been necessary, to do away with the practices of rebating and secret profits supposed to have been realized from the sale of securities.



FREDERIC A. DELANO,
President, Wabash Railway.

"It will be a sorry day for the Republic when regulation is carried to such an extreme that the owners of the railways are unwilling any longer to accept the responsibilities of management."

Digitized by Google

These practices, he declared, were things of the past. He approved emphatically of the interstate commerce law and the Interstate Commerce Commission. Not a single railroad manager in the United States, he said, would vote in favor of the abolition of either law or the Commission. If the railroads are not fairly treated, in his opinion, it was because the people were not acquainted with the facts which at present confront railway managers.

The public interest in higher freight rates as a means to larger railway development, was discussed by President Benjamin F. Bush, of the Missouri Pacific. His thesis was that transportation should keep pace with agriculture and manufactures. From 1900 to 1910, he showed, the capital value of agriculture increased 100 per cent, and the capital value of manufacturers 105 per cent, while the capital of the railroads increased less than 40 per cent. The value of the products of manufactures, he found, increased from $11,500,000,000 to over $20,500,000,000, or 81 per cent. It is essential in order that this rapid industrial development should continue, that the railroads should be allowed to increase their facilities. They cannot do this with the present rate of return. The last census showed that the net returns of the owners of manufactured capital were over 12 per cent, yet on the railway capital there was nothing paid on three and a half billion, and less than 5 per cent on seven and a half billion. President Bush concluded:

"If the railroads deteriorate in the service rendered, as they undoubtedly must if the conditions are not changed, it unmistakably means that commerce will be retarded; that industry will languish; that the many fruits of agriculture will wane; that the proud eminence we have attained in our many varied pursuits will crumble, and the unrest, discontent and dissatisfaction of an unemployed people may lead to the establishment of a new order of things with respect to the ownership and operation of the railroads of the country, with the attendant dangers to the perpetuity of our republican institutions. So the conclusion is irresistibly forced upon us that this railroad question is a Government problem, and one of very grave and serious concern, which should be satisfactorily settled, and the ominous dangers threatened averted thereby."

President Brown, of the New York Central, followed the line of thought indicated by the presiding officer. He pointed out that as a result of the period of unrestrained competition, when rebates and passes were most freely given, railway rates were reduced to a low level, and that the rates now in effect have not been substantially changed since that time, although the prices for material and labor are much higher. He also predicted that the inconvenience and loss which will come to the country through the lack of efficient and improving service for the railroads "will represent a burden fifty times greater than that of the slight increase in rates which railroad managers are trying so hard to get."

President Delano, of the Wabash, went even further than the preceding speaker, when he said that with the present margin of surplus railroad earnings, the period of railway building and extension in the United States is practically over. The opportunity for the building of small railroads, he claimed, no longer exists. No encouragement is offered to the investor in railroad securities and only the strongest railroads can continue their development.

An address which aroused much interest, because it presented the academic point of view, usually regarded as hostile to the railroads, was that by Prof. William Z. Ripley, of Harvard University. Professor Ripley pointed out that railway net income had declined about one eighth since 1910, a condition of affairs which make it practically impossible for the carriers to raise funds by the sale of long termed securities. Railway credit is also threatened by the continuous pressure by the railway brotherhoods for higher wages. No great relief is to be expected from increased efficiency of operation or from a growth of traffic. To counterbalance the steady improvement in operating methods, there is entering a decreasing efficiency of an increasing cost of labor, due to the restrictive policies of the brotherhoods, and aided by legislation. Increase of tonnage is not possible without overcrowding existing facilities, and, therefore, resulting in decreasing costs. In Professor Ripley's opinion, the only practical measure of relief is to allow a general advance in freight rates.

As yet no attempt has been made on the part of shippers' organizations to answer these arguments. Sentiment towards the railroads among the shippers has greatly improved during the last two years. Largely through the traffic association, where shippers and carriers meet for the discussion of problems of mutual interest, a basis of un-

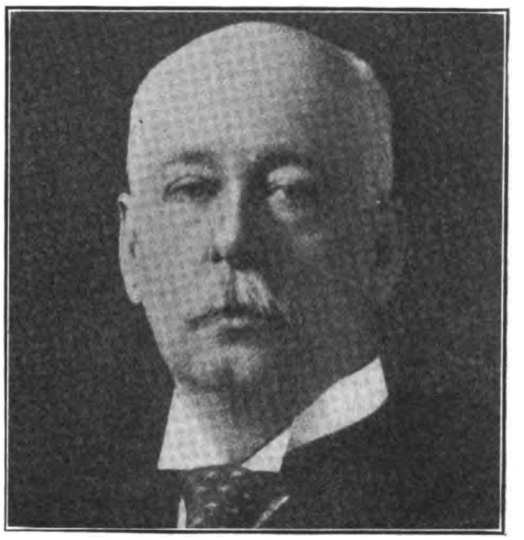
Digitized by Google

derstanding has been arrived at. The essential identity of interest between the railroads and those who use their facilities, has been so clearly and so often pointed out, that it is confidently expected that the shippers and shippers' organizations will not only not oppose the proposal to increase rates, but in many cases will actively support the position of the railroads. The case presented by the carriers will be much stronger than in 1910. Its object will be to show certain benefits which the public will derive from the increase of rates and certain disadvantages which the public will suffer if rates are not increased. It will recognize that the public is not greatly concerned in the welfare of the railroads *per se*. They are greatly concerned, however, in their own welfare, and if the railroads can show certain direct benefits to result from the increase of rates, it is reasonably certain that they can secure passive acquiescence on the part of the organs of public opinion, if not active support for their demands.

PRESIDENT MELLEN'S TESTIMONY

We regret that the space available this month will not suffice to give our readers a full account of the very remarkable testimony of President Mellen before the Interstate Commerce Commission on May 2. With the exception of the testimony of the late Mr. J. Pierpont Morgan before the Pujo Committee it is doubtful if the records of American state trials, similar to the old trials for high treason, brought not against noblemen, ministers and generals, but against great corporations and their executives, contain a fund of testimony so frank, so well-informed and so convincing. For five hours the examination of Mr. Mellen continued, and during that time every point in the combined indictment of Mr. Louis D. Brandeis and his New England coadjutor, the New York *Evening Post*, and its followers in the New England press, the various trade bodies of New England, and the numerous politicians who have tried to curry favor with their constituents by attacking a great corporation, were met and answered. The peculiarity about the testimony is that it is in no sense a defense. Mr. Mellen frequently admitted mistakes of judgment for some of which he was responsible and those mistakes against which he had protested. An examination of the entire record, however, shows clearly that the management of the New Haven and Hartford has been attacking with persistence and energy an extremely difficult task, that the suspicion of personal dishonesty or improper profit does not attach to a single act of the Mellen administration and that in time all of these acts will be justified by the result.

A few of the points touched upon in his testimony can be briefly noted. The accusation was made by the government accountant, who conducted the examination of the New Haven and Hartford books, that Mr. John Billard made a profit of $2,700,000 on his purchase from and sale to the New Haven of its Boston and Maine



CHARLES S. MELLEN,
President, New York, New Haven and Hartford Railroad.

stock. The New Haven, through the New England Navigation Company, had acquired about $110,000 of Boston and Maine stock in 1907. Prior to 1908, it had believed and had been advised by counsel that it had authority to acquire and hold this stock. On May 9, 1908, a decision adverse to this power was rendered by the Supreme Court of Massachusetts. The necessity was immediately presented of disposing of the Boston and Maine stock. In this emergency the entire block of stock was sold to John Billard, of New Haven, Conn., at $125 per share, and a year later, Massachusetts having enacted a law which permitted the New Haven, through the instrumentality of the Boston and Maine Holding Company, to hold the stock of the Boston and Maine, this stock was repurchased from Mr. Billard at

Digitized by Google

a nominal price of $150 per share, the difference between $125 and $150 per share represented the apparent profit of $2,700,000 and this profit has subjected the New Haven to severe criticism, the impression having been allowed to go out that some of its officials were improperly interested in the purchase. As a matter of fact, while Mr. Billard paid $125 in cash for the Boston and Maine stock, the purchase from him was in notes of the New England Investment and Security Company, guaranteed by the New Haven and Hartford. These notes had a market value of from $80 to $85. This transaction, however, is not yet completed and, as President Mellen said, "When this transaction is completed it will be found that while Mr. Billard has received the protection which was due him for having taken the great risk which was connected with the transaction, he will not have received a net profit that is any more than he is entitled to."

President Mellen also explained the much criticised sale of the sleeping and parlor cars to the Pullman Company. It is claimed that this sale for a price of $3,300,000 was unprofitable to the New Haven and Hartford, and again the suggestion of improper motives, largely by way of insinuation and innuendo, has been made. Newspaper readers will probably remember the character of the newspaper headlines in which this transaction was referred to. The facts furnished a complete explanation of the wisdom of the sale. The New Haven was faced with the immediate prospect of reducing its Pullman rates. It was also necessary, to meet the demand of the public for increased safety in travel, that they should expend within the near future $4,000,000 for new equipment to supply new steel cars. The Pullman Company took the cars at substantially the book value for the purpose of getting the contract, relieving the New Haven of a capital expenditure of $4,000,000 and paying $3,300,000. The Pullman Company pays all the expenses connected with operating the cars and $700 per car for the privilege. This is the best contract which the Pullman Company has made with any railroad in the country. The Pullman Company has already furnished one complete train of steel cars for use on the New Haven, another train will be ready in July, and this substitution will continue until every wooden car is off the New Haven.

One more point made by President Mellen is especially deserving of comment. The New Haven has been severely criticised for its steamship purchases. By these acquisitions it is alleged the company is attempting to maintain a monopoly of transportation in New England. On this point President Mellen offered a personal explanation. On February 8, 1907, he submitted to the board of directors of the New Haven an offer made on behalf of Mr. Charles W. Morse, of $20,000,000 for the 50,000 stock in the New England Navigation Company that stood on the books of the New Haven and Hartford for the cost of $5,948,469. Mr. Morse strongly urged his directors to accept this offer, for one reason because of the possibility of regulations at Washington requiring railroads to sell their steamship lines. No other director except Mr. Mellen favored this proposition and it fell. The wisdom of the arrangement which he then proposed is now plainly apparent.

Every point which has been made against the New Haven management was handled by Mr. Mellen in his five hours' testimony with similar frankness. He explained his personal transactions with the company, the company's campaign contributions through him, his purchase of the Rhode Island trolleys, his purchase and construction of lines about Boston, the purchase of the Central New England and the Berkshire Street Railway, and the New York, West Chester and Boston without reserve, and with a wealth of detail and a frank acknowledgment of mistakes where mistakes had been made; and surprisingly few mistakes have been revealed—that was most convincing. The impression which a reading of his testimony leaves is that of an absolutely honest man, entirely devoted to the building up of the prosperity of the section which depends upon his company for transportation, constantly dealing with complicated problems of vital importance demanding immediate solution, continually embarrassed by legislative attacks and by insistent criticism, and yet in the face of tremendous difficulties carrying forward a great work to its final completion.

LABOR DEVELOPMENTS

The agitation for higher freight rates brings into prominence the continued agitation for higher wages which has now passed to the trainmen. The demands of the Trainmen's Brotherhood upon the managers of the East-

W. G. LEE,
President, Brotherhood of Railroad Trainmen.

A. B. GARRETSON,
President, Order of Railroad Conductors.

ern railroads, were refused on May 1st. The grounds of the refusal were substantially that the increase of pay demanded was excessive, being about $17,000,000, or 20 per cent. The Conference Committee of Managers pointed out that the confessed inability of the railroads to meet these demands was largely due to the heavy burdens incurred through ill-advised legislation, such as the full-crew laws, for which the Brotherhood of Railway Trainmen is alone responsible. As their revenues now stand, they are unable to make the improvements which are demanded by the requirements of their position as public servants, and to increase their cost of operation by granting the demands of the trainmen would be either to impose heavier burdens upon the public or to approach dangerously near the line of insolvency. The present wages and working conditions of the trainmen, the Conference Committee points out, are liberal. They were fixed by E. E. Clark former president of the order of Railway Conductors, and P. H. Morrissey, president of the Brotherhood of Railway Trainmen, who acted as arbitrators in the New York Central controversy in 1910. They are more favorable than those of any other class of railway employes, and they represented in 1910, as stated by the president of the Brotherhood of Railroad Trainmen, "for conductors, trainmen and yardmen in the East, about $30,000,000 increase per annum."

The next step in the program is a strike vote. This will soon be taken and the result is a foregone conclusion. The only question of doubt concerns the attitude of the railroads. They were forced to concede arbitration in the case of the engineers and firemen, because engineers and firemen possess the monopoly of a certain kind of skilled labor indispensable to the operation of the railroad. Conductors and brakemen, however, possess no such monopoly. Their duties are routine, the intelligence required to perform them is not high, and they can be learned in a short time. If the conductors and brakemen on the Trunk Lines should decide to strike the railroads could, it is fair to say, put on notice, as they are, readily fill their places. Whether they will resort to this step is uncertain. Unless, in our opinion, they make a stand somewhere, the $40,000,000 which they may reasonably expect to receive from the Interstate Commerce Commission will be quickly swallowed up by the demands of railway labor, and they will be compelled to traverse again the weary round of demand, conference, refusal, strike vote, arbitration and increased wages. It is, in our judgment, far better to establish some definite standard of return for railway capital, which can be employed to determine the reasonableness of rates, wages, taxes and regulations. Failing the establishment of such a standard, however, it is to be hoped that the railroads will make a stand somewhere along the line against the steady encroachments upon their income by the railway brotherhoods.

H. M. JONES. W. D. PENCE. J. S. WORLEY. E. F. WENDT. R. A. THOMPSON.

Advisory Board of Engineers who are to assist the Interstate Commerce Commission in their Physical Valuation task.

PHYSICAL VALUATION

The first step in the task of making a physical valuation of the railroads of the United States was taken by the Interstate Commerce Commission when it selected its board of valuation engineers on May 1st. The announcement issued by the Interstate Commerce Commission divides the country into five districts for valuation purposes; each of these districts is to be in charge of an engineer and in addition each engineer will be a member of a board to advise with the members of the Interstate Commerce Commission and with the Advisory Board of three engineers which is yet to be appointed. The personnel of the Board of Engineers is very satisfactory. Without exception they are men of experience and ability, admirably well fitted for the difficult task before them.

Mr. Robert A. Thompson was for eleven years chief engineer of the State Railroad Commission of Texas, and has also spent five years in the employ of railroads. Since October, 1911, he has been chief engineer of the State Railroad Commission of California, where he has had charge of extensive valuation work.

Mr. Edward F. Wendt has spent twenty-four years in the engineering department of the Pittsburgh and Lake Erie. Since 1898 he has been assistant engineer in charge of the maintenance of way and construction and contract work. Mr. Wendt, in connection with the late Walter Berg, has made extensive studies in the valuation of railroad property. He was elected president of the American Railway Engineering Association at its last annual meeting.

William D. Pence for six years was assistant engineer and resident engineer on the Atchison, Topeka and Santa Fe. He has also served as a teacher and professor at the University of Illinois, Purdue University and the University of Wisconsin. Since 1906 he has been chief engineer of the Wisconsin State Railroad Commission and the State Tax Commission, and has had extensive experience in valuation work.

John Stephen Worley has had a large amount of railroad experience. He was chief engineer of construction on the St. Louis and North Arkansas, chief engineer of the Kansas, Oklahoma and Southwestern, and of the Fort Scott and Pittsburgh. He has also had large experience as an engineer on municipal improvements and appraisals. Since 1909 he has been a member of the firm of Worley and Black, of Kansas City, consulting engineers. Mr. Worley took part in the examination of the physical properties of the Central Georgia and the Buffalo, Rochester and Pittsburgh, and in 1912 was engineer in charge of the investigation of the methods of operation and accounting of the Delaware, Lackawanna and Western.

Howard Murfree Jones has had eleven years' experience in railroad work, most of the time with the Nashville, Chattanooga and St. Louis. His specialty is bridge construction and he has had a large amount of experience in this field.

The task set before this Board who will act for the Commission is defined in the law as follows:

"In such investigations said Commission shall ascertain and report in detail as to each piece of property owned or used by said common carrier for its purposes as a common carrier, the original cost to date, the cost of reproduction new, the cost of reproduction less depreciation, and an analysis of the methods by which these several costs

Digitized by Google

are obtained, and the reasons for their differences if any.

This task is a difficult one. In our opinion it will be impossible, even with the prescribed co-operation of the railroads, to carry out in detail the purposes of Congress. It is true that the main burden of furnishing the material upon which the valuation is based is placed upon the railroads who are required to "furnish to the Commission or its agents from time to time, as the Commission may require, maps, profiles, contracts, reports of engineers and any other documents, records and papers or copies of any or all of the same, in aid of such investigation and determination of the value of the property of said common carrier, and shall grant to all agents of the Commission free access to its right of way, its property, and its accounts and records, and memoranda whenever and wherever requested by any duly authorized agent, and every common carrier is hereby directed and required to co-operate with and aid the Commission in the work of the valuation of its property in such further particulars and to such extent as the Commission may require and direct, and all rules and regulations made by the Commission for the purpose of administering the provisions of this section. * * * * shall have the full force and effect of law."

It is estimated that the cost of this work to the railroads will be at least $7,500,000. So many of the elements of value of which the law takes account are, however, so difficult of accurate calculation that it is unreasonable to expect anything more than a wide approximation under these heads to be the result of the Commission's activities.

Railway officials are not alarmed by the prospect of a physical valuation of their properties. They are firmly of the opinion that the investigation will prove that the railroads are generally under-capitalized and that the assets, as given in annual reports, do not fairly represent the cost of reproducing the company's properties. In this connection it is of interest to review some former attempts at physical valuation. The State of New Jersey last summer completed an appraisal which had been under way since 1909. For seven leading systems operating in the state, an actual valuation of $343,301,589 was shown against the total capitalization applicable to the property within the state of $357,346,186.

Similar valuations have been made by Washington, South Dakota, two by Michigan, Minnesota and Wisconsin. In the cases of Washington and Minnesota the cost of reproducing the properties was considerably above the capitalization of the companies owning them. In South Dakota, Michigan and Wisconsin the cost of reproducing was placed at lower figures. The valuation of railroad properties in Trunk Line territory are certain to be very much higher on account of the value of terminals and extensive engineering work than the railroads operating in the South and West. It is a safe conclusion that the final result of the valuation will show, as already stated, that American railroads are greatly under-capitalized.

DEVELOPMENTS AT THE NATIONAL CAPITOL

Opposition to the Democratic program of taxation is growing. Washington is full of representatives of manufacturers who are unceasing in their protests to their own Senators and Representatives as to the disastrous effect which the new schedules will have upon their business. No doubt many of these predictions of disaster are exaggerated. There is, however, much reason to apprehend a considerable amount of industrial disturbance. It is impossible to say that there is a chance of these protests having effect. The President has announced that his position is unchanged; he will insist on the passage of the Underwood bill by the Senate. In this connection it is of interest to note that appointments are still being held up, presumably for the effect of the delay upon Senators who may not be inclined to support the full tariff program of the President.

The answer of the Administration to the predictions of wage reductions to follow the new tariff, as delivered by Secretary Redfield, of the Department of Commerce and Labor, was that he is planning an investigation into the business methods of large employers of labor generally who attempt reprisals on their workers by reducing wages should the Underwood bill pass the Senate. The Secretary did not state what he proposed to do as a result of these investigations, but the general impression to be gained from his deliverance was a threat of dire punishment to any manufacturer who reduced wages because of the new tariff. This declaration has aroused the deepest resentment among manufacturers. President Alba B. Johnson, of the Baldwin Locomotive Works, voiced the general impression as follows:

"Personally, I think it one of the most ar-

Digitized by Google

rogant pieces of demagoguery that has ever reached my ears. I have been surprised at some of the things previously put over in Washington, but this one tops everything. It appears that they don't mind the derision that is being thrust upon them, because if they did they never would send out ultimatums of this kind. I would rather not comment upon the ridiculous declaration to any length because I don't consider it worth it."

Opposition to the Income Tax law is also growing. In accordance with instructions at a previous meeting, the New York Chamber of Commerce Committee on Finance and Currency on May 1st presented a report on the Income Tax which strongly criticised the proposed law. The criticism of the committee is based upon the system of deduction of tax at the source of the income, which is a leading feature of the scheme. The committee points out that this feature has been imported from England but that the framers of the law have failed to take into account certain differences between England and the United States. In England, for example, the tax exemption is so low that there are practically no holders of securities who are exempted. In the United States, however, enormous amounts of bonds, stocks and mortgages are held by persons whose total income does not reach $4,000. The Income Tax bill, however, provides for the deduction of the tax by corporations, firms and individuals paying interest, salaries, etc., to be paid by these persons to the collector. Those who are entitled to the $4,000 exemption must file with the party required to withhold and pay the tax for them, affidavits claiming the benefit of this exemption. The objections to this method are serious. Every corporation must mark, for purposes of separate identification, every interest payment. A large number of applications to every company will be necessary by persons who are exempted from the tax. This means great expense, endless annoyance and frequent injustice. In the case of interest coupons, for example, which are largely collected through banks at the place of payment, which, being received for collection from other banks or bankers rather than from the bondholders direct, every coupon collected will, under the proposed law, have to be separately marked from the time it starts on its journey and in many cases must be accompanied by affidavits to secure exemption.

While the anti-corporation activities of the Wilson Administration have been necessarily held in abeyance until the tariff bill is passed, indications are not lacking that a determined attempt will be made to continue the campaign against industrial and railroad combinations as soon as the tariff and currency questions are out of the way. The Department of Justice has admitted that papers are in preparation for a suit under the Sherman anti-trust law aimed to dissolve the Reading's control of the Central Rail-

Digitized by Google

road of New Jersey. It is also announced that the Attorney General will soon begin a broad investigation of the New England railroad and steamship situation, with particular reference to the New York, New Haven and Hartford. Reference is made in another place to the determination of the Department of Justice to force the Southern Pacific to give up its ownership of the Central Pacific. On the other hand, there is a confident expectation in labor circles that the President will soon sign the Sundry Civil Bill which protects labor unions and combinations of farmers from prosecution under the Sherman law.

These few straws show that the winds of administrative policy are blowing strongly against the corporations and that, on the other hand, the greatest consideration will be shown to organized labor or organized agriculture, the sources from which the Democratic party must draw its support in the next Congressional election. In spite of President Wilson's assurances that business has nothing to fear from his administration, he has done nothing or said nothing officially, nor has any utterance been made by any responsible Democratic leader in Congress, which leads to any other inference than that the President is determined to effect a thorough-going, radical and drastic revolution of economic conditions in the United States, to bring about what he terms the "equality of opportunity." That the carrying out of this program is fraught with possibilities of serious damage to American business is well recognized, and business men in all parts of the country are taking the most conservative courses open to them pending the development of these policies.

SHIPPING INTERESTS ENDORSE COMMERCE COURT

Sentiment in favor of the retention of the Commerce Court continues to grow. It is now generally recognized that this tribunal performs a useful function in expediting appeals from decisions of the Interstate Commerce Commission. A needed amendment of the law, which is embodied in a bill endorsed by Representative Broussard, of Louisiana, provides that jurisdiction as vested in the Commerce Court and the review of orders of the Interstate Commerce Commission be applied in negative and affirmative orders alike. This provision gives the same right to the shipper that is accorded to the carrier under the present law. At present only the carrier is allowed to appeal to the court, which right is denied the shipper. The amendment will make the Commerce Court an impartial body between two contending forces. Of necessity, a court to which only the railroads could appeal would be regarded by the shipper with a certain amount of antagonism.

A fair indication of the change in sentiment towards the Commerce Court is contained in a statement by Mr. D. O. Ives, traffic director of the Boston Chamber of Commerce, which was one of the first bodies to publicly express its position in favor of continuing the Commerce Court. With only one class of litigation to handle, judges of the Commerce Court are in a position to become expert in all matters concerning railroads and transportation. At the same time the personnel of the court will slowly change as a result of the provision in the law for the designation of new members of the court each year, which will prevent the court from falling into a rut. Mr. Ives calls attention to another argument in favor of the court, in fact the strongest argument which can be urged in its behalf, namely, the fact that it has greatly expedited appeals from the Commission. The friends of the Commerce Court have been very active and are doing everything in their power to impress the President with the advisability of continuing the tribunal. While the President has as yet given no definite expression of his opinion it is believed that he will favor the continuance of the tribunal.

PROGRESS IN THE HARRIMAN LINES DISSOLUTION PROCEEDINGS

Those in charge of the disposition of the Southern Pacific holdings of the Union Pacific are making some progress. The Union Pacific now has $126,650,000 of Southern Pacific stock free in its treasury. $108,000,000 of this stock was, until last December, pledged under the mortgage securing the Oregon Short Line refunding 4 per cent bonds. In this indenture it was provided that "any stocks, bonds, or other securities held by the trustees hereunder may be withdrawn by paying to the trustees, in cash, or in bonds issued hereunder, taken at their face value, an amount equal to 80 per cent of the value of such stocks, bonds or other securities. * * * * Of the $100,000,000 Short Line refunding bonds issued only $45,000,000 were outstanding in the hands of the public, the remaining $55,000,000 are owned by the Union Pacific, and were untouched at the time of the

Digitized by Google

FORMER SENATOR JOHN C. SPOONER OF WISCONSIN, Attorney for the Union Pacific in the Dissolution Proceedings.

merger decision." These $55,000,000 Short Line bonds were part of the collateral substituted for the release of the Southern Pacific stock. In addition, the Union Pacific deposited 61,700 shares of Baltimore and Ohio stock, 40,000 shares of New York Central stock, and 18 San Pedro, Los Angeles and Salt Lake City fifty year bonds. This substitution of collateral removes an obligation which, it was feared, would arise on the part of holders of these Short Line bonds, to the consummation of the new plan for the sale of the Southern Pacific stock.

The courts are helping on the plan of dissolution in every way possible. United States Judges Sanborn, Hook and Smith recently filed a memoranda in which they made certain suggestions bearing upon the new reorganization plans submitted to them by Judge Lovett. The point of this suggestion was that any plan of dissolution should make sure that the Union Pacific stockholders did not continue as individuals the control which their corporation was no longer allowed to have of the Southern Pacific. It was pointed out, in the memoranda, that 4,440 of the Union Pacific stockholders held $82,162,400 of Southern Pacific stock, exclusive of the stock involved in the suit. Judge Lovett, in a plan informally presented to the court, provides that certificates issued against the $126,650,000 of Southern Pacific stock in the Union Pacific treasury be offered for sale to Union Pacific stockholders, barring all holders of 1,000 or more shares of Union Pacific stock. The number of such holders is 368. Provision is also made in the plan for a syndicate to underwrite their certificates or to sell on the New York Stock Exchange such certificates as are not provided for. The plan also provides that the $126,650,000 Southern Pacific stock to be deposited with a trustee be disenfranchised while so held by the trustee; that the certificates of interest to be issued by the trustees against the stock have no voting power and that the certificates of interest be exchanged for Southern Pacific stock only after the applicant affirms that he is not the holder of 1,000 or more shares of Union Pacific stock.

In our opinion the objections which have been raised by the Government and by the court to the plan of dissolution proposed by the officials of the Union Pacific is fanciful in the extreme. These companies do not now and never have competed in any sense of the word. The Supreme Court in ordering their separation did not contend that they were attempting to establish a monopoly but merely that they had the power to establish a monopoly. It is altogether unlikely, no matter what disposition is made of the Southern Pacific stock by the Union Pacific, that any effective combination in restraint of trade would be accomplished through individual ownership. It is not by individual holdings that effective combinations can be formed and continued. The stock representing the control of competing companies must be placed in the hands of some permanent body, whose directors shall vote it in accordance with a well defined and continuous policy of joint development. In our opinnon the court and the Department of Justice are making a mountain out of a very small mole hill.

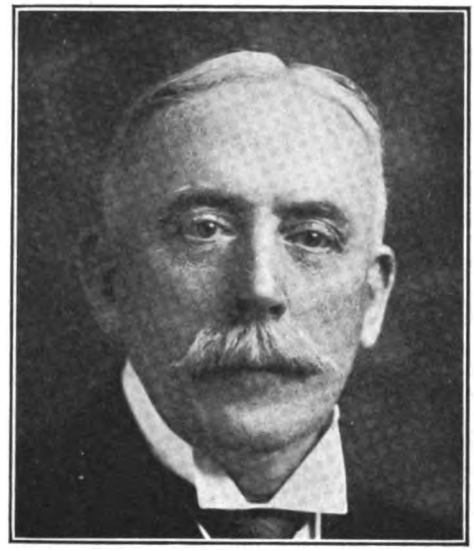
A new element has been introduced into the situation in the attempt of the Attorney General to force the Southern Pacific to sell the Central Pacific. The Supreme Court, in the merger decision, did not say that the Southern Pacific must sell the Central Pacific. Attorney General Wickersham, however, threatened to bring another suit to compel the sale of the Central Pacific on the ground that it was entirely a competitive line of the Southern Pacific route via El Paso. Attorney General McReynolds has not yet gone so far as his predecessor, but he has intimated that a continuance of ownership of the Central Pacific by the South-

Digitized by Google

ern Pacific will be looked upon with extreme disfavor by the Department of Justice. The Southern Pacific is willing to sell the Central Pacific, as provided for in the original plan, to the Union Pacific, but here enters the California Commission with a demand that any such sale shall recognize the rights of the Union Pacific to the use of the Benecia cut-off. Without such a provision the Commission will not give its approval to the sale. The inclusion of this feature, however, naturally makes the Central Pacific less attractive to the Union Pacific and it is understood that a cut of $12,000,000 has been made in the offer made to the Southern Pacific for the Central. This offer is not satisfactory to the Southern Pacific directors and so the matter hangs, pending the definite action on the part of the Department of Justice whose attitude is still elusive.

THE WORLD WIDE INFLUENCE OF THE U. S. STEEL CORPORATION

The testimony in the hearing of the Government's suit to dissolve the United States Steel Corporation has, of late, strongly favored the corporation. President James A. Farrell has proven the strongest witness in behalf of his company. President Farrell made his reputation as a salesman and above all a salesman in foreign trade. He testified on May 13th that one of the chief purposes of the organization of the company was a development of the export trade of its subsidiaries. President Farrell showed that in 1901, the first year of the company's existence, its export business was only 292,000 tons. In 1912 this business had increased to 2,246,600 tons, valued at $92,000,000. Ninety per cent of the country's foreign trade in steel was handled by the United States Steel Corporation. Contrary to the practice of most American manufacturers who enter the foreign trade field only when the domestic market is insufficient to keep their capacity employed, the United States Steel Corporation has made a continuous effort to build up its foreign business which, in President Farrell's opinion, is largely responsible for its success. In the case of the Carnegie Steel Company, to show how considerable is the foreign business which has been won, the export trade amounts to 24 per cent of its entire production. The corporation has 268 agencies located in all parts of the world, as many as 1,800 special steel products are manufactured by the United States Steel



JAMES A. FARRELL,
President, United States Steel Corporation.

Corporation to cater to the various needs of the foreign customer and many of these are made exclusively for this purpose, and it has won its way to a large and flourishing business in foreign lands in the face of the most determined opposition.

It is evident that no single member of the United States Steel Corporation, nor any of its competitors, could carry on a campaign for foreign business on the same comprehensive plan as is possible for the Steel Corporation. Manufacturing a vast variety of products and possessed of immense financial resources, it is able to plan and carry out a world-wide campaign for the exposition of foreign trade. The success of the corporation in the export trade will be one of the strongest arguments in favor of its continuance. This success, as already remarked, is not the result of monopoly but has been won in the face of severe competition.

THE GROWTH OF THE PARCELS POST

The Parcel Post business of the Postoffice Department continues to grow with astonishing rapidity. Reports received at the Postoffice Department indicate that 59,500,000 parcel post packages were sent through the mail in April, a gain of approximately 54 per cent over January, the first month of operation. At the New York postoffice alone from January 1st to April 15th $1,026,000 worth of parcel post stamps were sold, and reports for the first two weeks of April at this of-

Digitized by Google

CONGRESSMAN DAVID J. LEWIS OF MARYLAND,

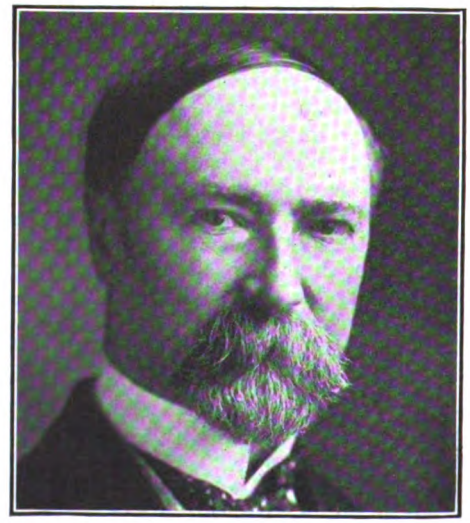
who suggests increasing the weight limit of the Parcel Post from eleven to one hundred pounds.

fice show that the ratio of increase is being kept up to 42 per cent monthly for incoming and outgoing business. In three months, at the New York postoffice, the values placed on articles insured was about $1,880,500. The value of merchandise so far shipped from New York City by parcel post would be about $51,000,000. The rapid growth of this business strengthens the demand that its usefulness could be extended. A recommendation is made to Postmaster General Burleson and the National Parcel Post Commission by Representative David J. Lewis, of Maryland, which would increase the weight limit from 11 to 100 pounds on all packages to be collected and delivered, and removes the weight limit on packages which are to be delivered and will be called for at postal terminals. Mr. Lewis also proposes a simple system of zones, a radical reduction of rates and various other amendments to the system which will practically do away with the parcels business of the express companies.

An interesting fact to be remembered in connection with the prospect of eliminating the express companies from the business which has hitherto belonged to them, is that only about 45 per cent of the net revenues of these companies have come from their transportation business. The 55 per cent comes from non-transportation activities. According to Mr. Walker D. Hines, counsel for the five express companies: "More than half the total net returns represent income from investments, and earnings on non-transportation and foreign business, checks for travelers, investments of former earnings in real estate, stocks, bonds." This business the postoffice does not propose to take from them.

WATERWAY DEVELOPMENTS

Divergent views regarding the right of the United States to exempt its coastwise vessels from the payment of Panama Canal tolls are being expressed at the various meetings of public bodies where this question is discussed. In a paper read before the seventh annual meeting of the American Association of International Law, for example, Richard Olney, former Secretary of State, held that this country was entirely within its rights as the owner of the Canal to make whatever rules it desired regarding the Canal. Mr. Olney declared that the "all nations" clause of the Hays-Pauncefote treaty referred only to the "customers" of the Canal; that since this nation could not be both customer and owner, the United States was not supposed to be included in the words "all nations." On the other hand, former Vice-President Charles W. Fairbanks, in an address on May 1st before the American Peace Conference, characterized the question as "one which from every consideration of national good faith and national honesty should be settled by ourselves, and if we rightly understand it there can be no doubt it will be settled in entire harmony with our manifest national



FORMER VICE-PRESIDENT CHARLES W. FAIRBANKS,

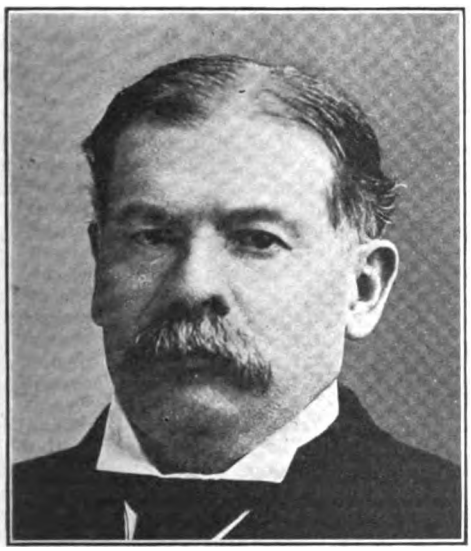
who asserts that the United States is under moral obligation to admit all ships to the Panama Canal on equal terms.

Digitized by Google

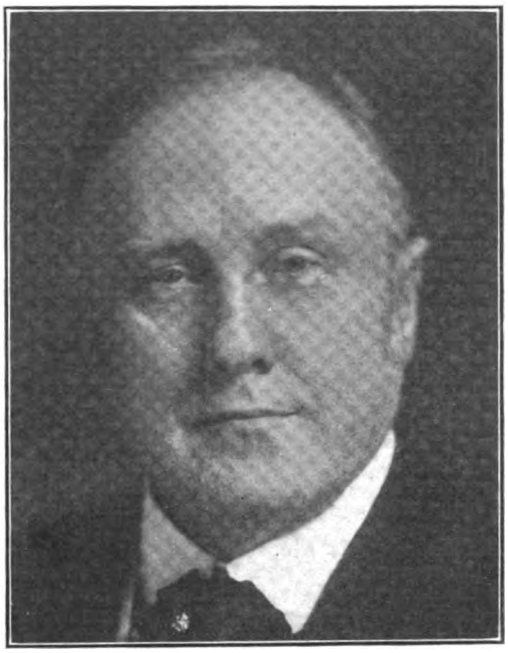
duty." "The United States," he continued, "is under moral obligation to admit the ships of other nations to the Panama Canal on the same terms on which it admits American vessels."

It is significant of the final outcome of the discussion, however, that followers of all shades of opinion, holding the most divergent views as to the rights of the United States. are agreed that the controversy should be left to the disposal of an impartial tribunal for its final settlement.

Judge Holt, in the United States Circuit Court, on May 21st, in connection with the claims for $16,604,731 filed against the White Star Line in connection with the Titanic disaster, held that the White Star Line has no right to the benefit of the American law of liability. The attorneys for the White Star Line have been confident that the Federal Court limited the liability of the White Star Line to approximately $97,000, the sum stipulated in the report of Special Commissioner Goodrich as the interest of the White Star Line in the Titanic. Judge Holt claimed that the English law should govern in this matter, that the liability of the owners of the Titanic is to be determined by the law of the country to which the vessel belongs, namely, England. According to the general principles of maritime law, no such exemption can be claimed by the White Star Line.



RICHARD OLNEY,
Former Secretary of State,
who declares that this country is entirely within its rights to make whatever rules it desires regarding the Canal.



GEORGE A. POST,
President of the Railway Business Association.

DECREASE IN RAILWAY SECURITY ISSUES

The Railway Business Association has recently issued a bulletin in which is set forth the results of a study made regarding the relative decline in the issue of railway securities during the past few years.

"The railroad share of total new securities issued has been declining sharply." This is the conclusion of a study of railway credit by the Railway Business Association, published in a Bulletin, "Shippers and the Advance in Freight Rates." The railroad proportion of total issues, says President Geo. A. Post, "was in 1912 the lowest of the decade, while other corporations issued their highest. There is something the matter with railway credit."

The Bulletin shows that from 1909 to 1912 the railroad share of all securities dropped from 62.4 per cent to 19 per cent. In 1909 the railway securities issued were $601,535,045 more than the non-railroad, and in 1912 the non-railroad securities issued were more than four times the railroad securities.

"Does the public want the roads to overtake traffic and go on ahead as in the past? This is for the public to say, and it is a perfectly proper function of administrative statesmanship for the Commission to heed public demand on that point."

Contemporary Opinion

Railroads and Prosperity.

THE Eastern railways' application to the Interstate Commerce Commission for an increase of 5 per cent in their freight rates has received strong support by the daily press throughout the country. It is apparent that many newspaper editors not only see justice in the request of the carriers, but have a keen appreciation of the fact that the drift of railway earnings and expenses have recently been such as to indicate that unless the railroads are permitted to advance their rates, the check to the transportation industry will be so severe as to seriously cripple the general business and prosperity of the nation. Since the railroads' application there have been an unusually large number of editorials published in favor of this advance. A few, however, will suffice to show the attitude which is being taken by many editors on this question.

The Philadelphia *Ledger* says:

"More people are affected directly by an award of the Interstate Commerce Commission than by a decision of the United States Supreme Court. Thus when the railroads shall ask permission to increase freight rates five per cent the yes or no of the Commission may mean prosperity or hard times for many million people.

"This question of rates should be treated on the broadest possible scale. The country cannot afford to strangle or unnecessarily annoy its greatest single industry except agriculture. The welfare of the entire nation is so closely interwoven with the welfare of its tremendous railroad system that one cannot be hurt without as grievously wounding the other.

"No one can escape the conviction that in the past few years the railroads have been put into thumb screws. They have been forced to increase wages several times since the 1907 panic, so that to-day the railroads of the United States pay not only far greater wages than are paid in any other land, but much greater than were ever before paid in this country. Laws have been enacted which compel them to better their equipment and to safeguard their tracks. Public clamor has demanded the most lavish terminals—buildings that rival in splendor the best the world ever saw.

"In every possible direction have the roads been forced to expand and to spend more of their earnings. Wages, track and equipment, each and every one has cut more and more into revenue. The roads are powerless to increase passenger fares or freight rates. At the same time they are powerless to reduce expenses. The sequel is that while this country has been blessed by the most bountiful times ever witnessed, the railroads have not been able to share in it.

"Net profits earned on the outstanding capital stock do not rise. On the contrary, they are falling. If the stockholder were the only one to suffer the case would not be so serious.

"But the whole country rises and falls with the railroads. It has been so for half a century and is so to-day. When roads earn great sums they spend the money in countless ways. The steel mill, the nail factory, the locomotive works, the car builder, the coal mine, the timber owner, the contractor, all feel the effects instantly. Prosperity of the roads carries immediately good cheer to millions of workers who are not employed by them.

"When the railroads are poverty-stricken and curtail their outlay every other industry in America feels the jolt. And they must curtail them when the margin over necessary expenses dwindles to near the zero point. It is impossible for the railroads to keep on increasing wages and other expenditures without also increasing income. Bankruptcy would be the inevitable sequel.

"When the Interstate Commerce Commission takes up this freight rate request it is bound by every instinct of national welfare to consider it in the broadest possible way. The pastime of bullying railroads has ceased to be popular, because it is too dangerous. The Commission can do the country a very exalted service by dealing justly with the railroads without any unnecessary delay."

In *Leslie's Weekly* appears the following:

"It seems very simple to see the passenger trains run in and out of the station; to order the freight car and send the grain to market; to telegraph to the nearest large town for supplies, and in 24 or 48 hours have them delivered. But it is not so easy and simple as it seems, and there is danger to-day that the next great uplift in business in the United States will find the railroads, as a whole, sorely taxed to furnish the transportation needed for the commerce of the country. Why? Because a misdirected public opinion is demanding rates too low, taxes too high, wages too high, service too elaborate, and there are not cents enough in the dollars to meet all these obligations and still permit the business to be attractive enough so the man with the dollar will invest it. Our American railroads have done good work, and can do better, and it is to the farmers' selfish interest to see that they are so treated that they will be ready at all times to handle business. To be ready requires constant expenditure."

The New York *Mail* is of the opinion that:

"There seems to be justice and common sense in the proposed application of the Eastern railroads to the Interstate Commerce Commission for permission to make a 5 per cent increase in their freight rates.

"The time has come when Government recognition of rates should be justified by a spirit of fair dealing and a recognition of actual conditions.

"Nowhere in the country is there a sign of public opinion that favors a policy of discouragement or actual hostility to legitimate railroad enterprise.

"There is no reason why sound railroad enterprise should be harassed or destroyed.

"There is no reason why the railroad companies should not be able to make improvements necessary to the country's progress and prosperity, to allow reasonable advances in wages and to meet unavoidable losses.

"There is no reason why the transportation facilities of the American continent, so vital to its industry and commerce, should be gradually forced into unprofitableness to meet the purposes of political demagogues and fanatics.

"It is not merely the falling prices of railroad

Digitized by Google

securities in the stock market that signals the danger of the present iron policy of restricting railroad rates. The refusal of the public, both here and in Europe, to invest money in new bonds or other securities of the foremost and best-managed American railroads, save at almost prohibitive prices, shows that we have passed the line of prudence and reason in restricting the profits of our transportation systems.

"While the tide of wages keeps rising and must be met, if the public is to be saved from the engulfing calamity of a general railroad strike, one group of Eastern railroads is called upon to repair a loss of more than $20,000,000 caused by the great floods in Ohio and Indiana.

"In the light of these and other similar facts it seems plain that the Interstate Commerce Commission should give dignity and strength to the law by a reasonable and fair use of its powers. No good can be accomplished by crippling one of the chief means through which the productive life of the nation is made effective."

In the Baltimore *News* is found the following:

"Prosperity for the railroads, from the nature of the case, cannot mean mere profit-taking. It means an ever-increasing necessity to expand their equipment and organization to take care of increased business if they are to keep up with the procession. Indeed, if they are managed in the most enlightened way, larger receipts impose the necessity for larger expenditures to anticipate the future. For them, living from hand to mouth is little better than suicide.

"Not long ago a proposed increase of five per cent in freight rates would have stirred the shippers to almost united opposition. It is significant of a better understanding on both sides that business men are now giving respectful consideration to the request of the railroads. Lack of cars in busy seasons, slow service and inadequate terminals mean restriction for shippers when they have their best opportunities.

"But, in another aspect of the problem, the shippers are only part of the body-politic which has undertaken to impose burdens on the railroads through awards of higher wages by means of public arbitration, and through requirements of better equipment and service imposed by the Interstate Commerce Commission. There is now, for the first time, an implied obligation to permit the rates to conform with larger expenditures.

"It may be possible, as Vice-President Randolph, of the Baltimore and Ohio, has pointed out, to pay dividends on the basis of present rates, but his statement that improvements will be seriously checked unless an increase in freight charges is allowed presents a serious question, which should be weighed and decided in fairness. The Government having gone so far toward preventing the mere exploiting of railroads by financial manipulation, it can better afford to listen considerately to the story of their proper needs.'

The New York *Journal of Commerce* states that:

"The prevailing tone among shippers is evidently in favor of some moderate increase in railroad rates. This seems to be the plain inference to be drawn from the facts as stated with regard to the development of opinion and policy among the various organizations. Some important exceptions doubtless are to be noted, but the chief factors pretty clearly take the indicated point of view. The change in attitude is very plainly marked as compared with that which prevailed four years ago, when shippers bent their utmost energies to prevent the adoption of a higher rate schedule by the Interstate Commerce Commission. Reduction of railroad earnings as compared with obligations, growth in costs of capital, and the lowering of both construction outlay and new equipment purchases by the roads have afforded unanswerable arguments to those who regarded the demand for a rate increase as merely the fruit of a desire to get more profits without justification."

Again the New York *Journal of Commerce* says:

"There seems to be every just reason for this demand. There is an immense need for general railroad betterments, the lack of which has embarrassed their operations which at an early date in the near future will have to be met. Much additional rolling stock, improvements in roadbed, an immense amount of new metalling, terminal improvements, all these have become imperative. Could they all be done at once, it is estimated by the most competent that the total would run into nine ciphers. What the roads must have is that established increase in prosperity which would warrant them in securing long-term loans and that increase in security values which would tide them over the earlier struggle.

"This is not the sole plea which they claim they have the right to present before the Commission. Their demand for a 10 per cent increase was refused in 1910, but they can offer now a much stronger presentment. That is the increasing cost of railroad operation and the steady, almost inevitable, advance of wages. This is illustrated by the recent arbitration awards. The Vanderbilt commission gave the enigneers last year about $3,000,000 more on the Eastern roads and the recent firemen's award added upward of $4,000,000 more. The trainmen and the conductors are now in line for similar increases, and it is believed that when they have formulated specific demands, a situation will be created that will carry the amount several millions higher. One successful arbitration in such cases is pretty sure to predicate others.

"To meet these added burdens, which, with the high cost of living, are inevitable, the railroads claim with much show of justice, there must be increase of income. It is closely figured that if the gross income of the carriers has increased, their expenses have augmented much faster and cut down the net to a minimum, which does not make the railroad business as a whole nearly as encouraging to investors as are many other lines of business which require enormous capitalization."

Railway Wage Regulation.

THE continual and insistent demand by railway labor for increased wages continue to emphasize the importance of the passage of some regulative laws by which these matters can be handled in a way satisfactory to the interests of all concerned, of whom the general public form no inconsiderable part. The day will come when the question of increasing railway wages must be based on something more tangible

Digitized by Google

than the arguments advanced at recent hearings, or else a condition so intolerable will develop as to involve the entire business interests of the country. In discussing the far-reaching influences of railway wage adjustments, the Springfield (Mass.) *Union* has the following to say.

"The issues involved in these wage increases are not issues between certain classes of labor and individual corporations employing them. They are more far-reaching and involve the very business interests of the nation at large through the additional tax they impose upon the transportation systems of the country and have a direct bearing upon the work of the Interstate Commerce Commission. This fact is recognized in the Erdman act, but it already has been shown that the Erdman act is faulty. Inasmuch as legislation to correct the weakness of the Erdman act is necessary, why not take a long step in advance and create a new arbitral body—possibly under the new Department of Labor, but so constituted as to work in harmony with the Interstate Commerce Commission, which shall have the power to arbitrate these wage difficulties in which interstate public utilities corporations are involved and, if possible, create a system under which wage scales of these utilities may be established on some sort of a contract basis extending over a certain period of years and subject to variation during such period only on certain established conditions.

"It is true that in large measure this would be establishing governmental regulation of wages in such public utilities, but is that not a necessary corollary to governmental regulation of rates in which the wages are such an important factor?"

An Extraordinary Bill.

FEW more striking evidences have been seen of Labor's desire to place railway management at the complete mercy of labor leaders, than the bill recently defeated in the Pennsylvania Legislature, and which is commented on editorially in the following manner by the New York *Commercial*:

"A bill was killed the other day in the Pennsylvania Legislature which, had it passed, would have armed labor unionism, with such power that it would paralyze half the railroads in the country. Fortunately its animus was clearly recognized and though the labor advocates have a pretty strong hold on that body, they were routed 'horse, boat and dragoons.' This proposition was the anti-strikebreakers' bill; and it is said that the American Federation of Labor under the inspiration of Mr. Gompers has it in plan to push this or some similar measure in as many states as possible.

"The bill provided that as a preliminary to securing employment on any railroad, the engineer, conductor, fireman, trainman, or any one employed in operating a road must have had at least eighteen months' experience. Again it required that the applicant for a railroad job should have been employed at least three months on the same road and the same kind of work.

"It requires but little reasoning to see precisely what the result of this kind of labor legislation would be. A strike once started would paralyze any road in the country beyond a hope of resistance. No road could employ men from other roads, or men inexperienced in the particular kind of work to which they might be called to meet an exigency. There would be no resource of force to take the place of the strikers, no possibility of securing legal substitutes. Every engine, every car, every switch, every signaling station, in a word, everything necessary to running a road, would at the dictate of the strike leaders be struck dead for use.

"This extraordinary proposition was so full of venom that though the labor legislators supported it with enthusiasm, it was killed without much loss of time. Even those whose record had been hostile to railroad interests in legislation could not support a measure that would make a walking delegate more powerful than any railroad president through his ability to take railroads by the strangle grip. Probably no such drastic attempt was ever made to constitute labor as the supreme dictator over the transportation interests of a state, and initiate the same paralyzing tyranny everywhere.'

Safe Railroad Operation.

IN these days when it is apparently increasingly difficult to inject the proper amount of discipline in railway operations to insure the safety of the companies' patrons, employes and property, the stand taken by the New York Public Service Commission is gratifying. Commenting on this attitude, as expressed in its annual report, *Financial America* has the following to say:

"The Public Service Commission for the Second District, New York, in its annual report says: 'No permanent safety can be expected in railway operation except through the appreciation by all employes—not only those directly involved in train service, but those who maintain locomotives, tracks and signals—of the importance of their duties and the need of careful attention to every detail of their work.' Not content with this emphatic pronouncement regarding the observance of duty and carefulness by the employe, it admonished the employer in these words: 'No permanent safety can be expected in railway operation except through the appreciation by the railway managers of the necessity of strict discipline and removal of men from the service who fail to meet a reasonable standard of performance of duty in matters involving safety.'

"No matter what safety device may be introduced or installed by a railroad system, individual responsibility remains. In the case of the automatic stop signal the obligation is, in reality, only shifted from an experienced engineer probably to the signal maintainer, who may not be nearly so prudent. Hence, the weight and effect of the Commission's admonition to the railroad employer to enforce discipline by removing instantly men in its service who may be guilty of negligence."

The Proposed Increase of Freight Rates in England.

THE following quotations from news articles in the *London Times* of the dates specified are of interest as relating to existing conditions in the United States:

MAY 5TH:—

"A preliminary notice has just been issued on behalf of the railway companies of the United

Digitized by Google

Kingdom to the effect that on and after July 1 the rates for merchandise traffic by goods and passenger trains will, with certain exceptions, be increased.

"This increase is the outcome of the recently passed Railways act, which gives the companies power to raise rates to compensate them for increased expenses as a result of the settlement of the strike of August, 1911."

MAY 7TH:—

"The railway industry alone of any great industry in the country has been deprived by Parliament of the opportunity of passing on to the public what may be called its increasing 'cost of production.' We mean in particular the increased cost of coal, materials, higher wages, Government insurance against accident, unemployment, etc. In other words, all improvement in railway wages and in the conditions of railway employment—and they have, of course, been substantial already—have been effected neither at the cost of the shareholders, or have they come out of the funds provided by improved methods of management.

"If the just demands for further improvement in railway labor conditions are to be met without wrecking the whole financial edifice upon which the railway industry rests, it is clear that the public must pay. If only to secure continuity of railway service, absence of strikes, etc., some moderate increase in railway charges must be established, and this is the policy which the companies are now endeavoring to carry out under the direct authority of Parliament. Opposition will, of course, be encountered, but so long as the companies, acting in unison, are not extravagant in their demands and keep them well within the terms provided for by the new act, we do not imagine that any such opposition can avail when the matter comes before the Railway and Canal Commissioners, as it must do sooner or later.

"Legally and morally the claim of the railway companies is a just one, for *it would be absurd to assume that the railway industry alone can flourish under economic conditions which provide for fixity of its charges to the public on the one hand, and rapidly increasing expenses on the other.*'

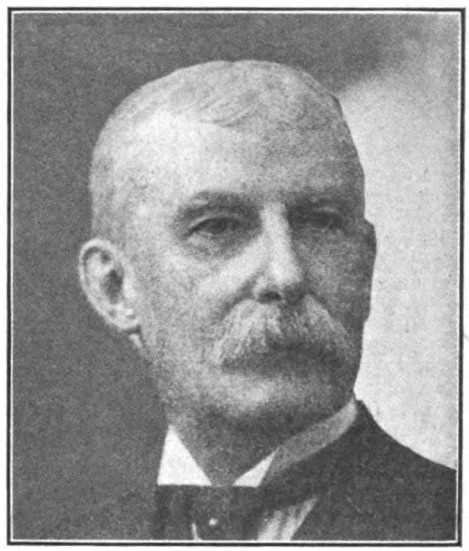
OBITUARY.

Henry M. Flagler.

HENRY M. FLAGLER died at his winter home, West Palm Beach, Fla., on May 20. He was 83. At the time of his death he was chairman of the board of the Florida East Coast Railway, which had been built largely with his money, entirely under his direction and as a part of his general plans for the development of the east coast of Florida.

His chief interest in life in the last fifteen years had been the development of the Florida East Coast, and the building of this railroad which runs from Jacksonville south along the extreme eastern shore of Florida to almost its southernmost end, and is there carried from the main line to the string of keys which ends with Key West. Mr. Flagler lived long enough to see the entire line, including the extension over the keys to Key West, in operation.

The 637 miles of line cost, with the equipment, $39,117,000, and was capitalized at $36,000,000, or about $56,000 a mile. Its earnings from operation in 1912 amounted to $4,427,000, or about $7,134 per mile. Its earnings, after the payment of expenses, rentals and taxes, amounted to $973,000 in the year 1912, or about 2.5 per cent on the actual investment.



HENRY M. FLAGLER.

It is probable that Mr. Flagler never considered his railroad as an investment for the purpose of getting the highest possible interest on his money. It was built for the development of the country through which it runs, and as such it has already proved a success.

E. J. Dedman, who was recently elected vice-president of the Gainesville and Northwestern Railroad, died on the morning of May 16th, at Gainesville, Ga.

Walter W. Aucker, superintendent of floating equipment of the Baltimore & Ohio R. R., died at his home in Baltimore, Md., April 8th, aged 61 years.

Peter E. Bowman, formerly superintendent of the New York Division of the New York, New Haven & Hartford, died on May 9th, at his home in New Haven, Conn., at the age of 65.

G. Asheton Carson, president of the Catawissa Railroad, a subsidiary of the Philadelphia & Reading, died recently at Philadelphia, Pa., at the age of 66.

George E. Chase, southwestern passenger agent of the Chicago, Milwaukee & St. Paul Ry., at Kansas City, Mo., died May 3rd, aged 45 years.

William Edward Davis, passenger traffic manager of the Grand Trunk System, died on May 15th, at his home near Ste Anne de Bellevue, Quebec.

Henry C. Dickson, traveling passenger agent of the Delaware, Lackawanna & Western, with headquarters at Chicago, died suddenly in that city on April 16th, aged 50 years.

A Reasonable Return Upon the Value of the Property Devoted to the Public Service

By EDWARD SHERWOOD MEAD, PH. D.

IN the words which form the title to this article, Mr. Charles A. Prouty, speaking for the Interstate Commerce Commission, on February 22, 1911, stated the problem presented to the Commission by the petition of the trunk lines that they should be allowed to advance their rates. "We are to determine," said the Commission, "whether the net return of these carriers upon the value of their property devoted to the public service will be sufficient without an advance in their rates."

After an exhaustive review of the testimony presented on behalf of the railroads, and the arguments advanced against them, the Commission reached the conclusion that "these defendants have not established such a need for additional revenue as justifies, at this time, an increase in these rates." This decision was, however, without prejudice to the railroads, the Commission holding that:

"It has been several times stated in the course of this discussion that in view of the complex character of this problem, nothing but an actual test can satisfactorily determine the financial results from the operations of these several carriers. There is no evidence before us which establishes the necessity for higher rates. The probability is that increased rates will not be necessary in the future. In view of the liberal returns received by these defendants in the past ten years, they should be required to show with reasonable certainty, the necessity before the increase is allowed. If actual results should demonstrate that our forecast of the future is wrong, there might be ground for asking a further consideration of this subject."

The railroads have again petitioned to be allowed to make a five per cent advance in all the rates in Official Classification territory, equivalent to a $40,000,000 increase in net revenues. If their officials were not convinced that the "actual test" asked for by the Commission, had demonstrated that the Commission was wrong, the railroads would not make an attempt to increase their rates. What then is the nature of this experience of the last three years upon which the railroads must rely if they are to induce the Commission to reconsider its decision of 1911?

This question must be answered with reference to the reasoning upon which the Commission's former refusal was based. In substance this was as follows: The Pennsylvania, Baltimore and Ohio and New York Central are typical trunk line railroads. Their freight revenues were nearly one half of the total freight revenue in Official Classification territory. "Whatever rate might reasonably be imposed upon these three systems must be held to be a reasonable charge for that service by all lines."

The Commission defined a reasonable return upon the property of these three companies to be a margin of profits equivalent to certain earnings upon their common stocks. For the Baltimore and Ohio it was held that "the sum remaining after fixed charges, including as a fixed charge the dividend upon the preferred stock should be equivalent to between 7 and 8 per cent upon the common stock" or about $2,280,000 —1½ per cent on the present common stock. For the Pennsylvania, a margin of $18,000,000 over common stock dividends was held not to be unreasonable. For the New York Central the Commission found that, after allowing for an expected increase in operating expenses due to the higher wage scale which went into effect in 1910, the company could pay its 6 per cent dividends with about $1,500,000 to spare. For several reasons, including an admitted inflation of the capital of the constituent companies and of the New York Central at the time of the consolidation in 1869, amounting to $57,000,000, on which stock issued without consideration to the company, $120,000,000 in dividends had been paid, and not omitting to mention the fact that the New York Central was burdened with unprofitable leases, losses on which the public should not be expected to make up to its stockholders in higher rates, and having regard finally to the exceptionally strong position of certain of the New York Central's subsidiaries, the Commission reached the conclusion that this margin of $1,500,000 over the dividend requirement was not so small as to warrant an increase of freight rates in order to increase it.

We have then this standard by which to determine the reasonableness of rates in Official Classification territory. If it can be shown that existing rates at the present time yield these three companies substantially less than the amount of profits, which the Interstate Commerce Commission in 1911 declared to be reasonable, then the carriers will have established their case. If, on the other hand, the dividends of these three typical companies, notwithstanding higher operating costs and increased fixed charges are still protected by the same relative margins of safety as those which the Commission considered adequate in 1911, then the railroads have lost their case before they open it.

The facts of railway profits for the last year for which statistics are available are as follows for each of the three companies under examination:

PENNSYLVANIA RAILROAD COMPANY—YEAR ENDING DECEMBER 31, 1912.

Net income	$42,153,964
Dividends 6%	27,198,918
Balance	$14,955,046

BALTIMORE AND OHIO—YEAR ENDING JUNE 30, 1912.

Balance of net income on preferred dividends	$11,543,000
Dividends on common 6%	9,121,073
Balance	$2,421,927

NEW YORK CENTRAL AND HUDSON RIVER RAILROAD—YEAR ENDING DECEMBER 31, 1912.

Balance of net income over all charges	$13,879,837
Dividends 5%	11,136,465
Balance	$2,743,372

Digitized by Google

Amount required to pay 6%, the standard accepted by the Commission in 1911	$13,563,558
Balance—over 6%	316,279

Summarized, these results are as follows:

BALANCE OF NET EARNINGS OVER CHARGES ACCEPTED BY THE COMMISSION AS STANDARD IN 1911.

Baltimore and Ohio	$2,280,000
Pennsylvania	18,000,000
New York Central	1,500,000

BALANCE OF NET EARNINGS OVER CHARGES FOR LAST FISCAL YEAR.

Baltimore and Ohio	$2,421,927
Pennsylvania	14,955,918
New York Central	316,279

From these figures it appears that, measured by the standard accepted by the Interstate Commerce Commission, the Baltimore and Ohio is in about the same relative position as in 1910, the New York Central has suffered a severe decline in its margin of safety, and the margin of safety of the Pennsylvania has seriously decreased.

On the basis of the Commission's reasoning in 1911, and taking no account of changes in conditions affecting the railroads since that time, the carriers are evidently entitled to an increase in rates.

The situation of the carriers is, however, radically different from that of 1910. Then their earnings were large and increasing, reflecting a condition of general prosperity. Investment conditions both in America and Europe were satisfactory and financing was easily accomplished. The labor situation was generally satisfactory, and in the field of public regulation, a reaction in favor of the railroads was in progress. To-day, conditions have entirely changed for the worse. Railway earnings are stationary or declining. Weak companies, if still solvent, are facing financial difficulties. Strong companies are twisting and turning from one emergency expedient to another in the attempt to finance the maturing obligations. The investment situation at home and abroad has seldom been so bad. Railroads must apparently pay five per cent for money, and will have difficulty in filling their requirements even at that high figure. The attitude of labor was never more menacing. Its insistent demands have forced up operating costs without any cessation of the pressure, and these demands are apparently endless. More than this public regulation has taken a new turn. Greater safety in travel, improved working conditions for employes, even the compulsory provision of larger facilities, for the convenience of shippers, such regulations as these are multiplying, and each one adds to the cost of railway operation.

The situation of the railways is plain. It cannot be denied that as a whole their financial position is strong and sound. They are in no danger of failure. They can sit still, limit the scope of the improvements, keep down new construction to the irreducible minimum, and wait till the slow growth of business forces their earnings up to a figure which will make it possible for them to provide the necessary facilities. On the present scale of earnings however, the vast programs of improvement which they have drawn up, and whose execution will do so much to advance the prosperity of the whole country, cannot be carried through. Most of the feature numbers on these programs must be postponed, indefinitely deferred.

The railroads have made a fair and reasonable proposition to the public represented by the Interstate Commerce Commission. "If you will allow us to increase our rates we shall use the resultant improvement in our credit to improve our plant. We shall employ more labor, spend more for materials, make large permanent additions to the transportation plant of the United States. Without this increase in rates, however, these expenditures cannot be made." It is to be hoped that the Commission will recognize that conditions since 1910 have radically changed, and that the advance in rates which was not then conceded can now be made with due regard to the controlling consideration in all matters of this character and the public welfare.

Vast Public Interests Involved in Rate Question

By SLASON THOMPSON,
DIRECTOR, BUREAU OF RAILWAY NEWS AND STATISTICS.

WHILE the application of the railway companies operating in the territory east of Chicago and north of the Potomac and Ohio rivers to the Interstate Commerce Commission for permission for an advance of five per cent in freight rates covers only one fifth of the total mileage and less than half the freight traffic of the United States, the future of the entire transportation industry of the country waits upon its favorable decision.

Since the previous application by both Eastern and Western roads was denied, the reasons for an advance already pressing have been accentuated, while the forecasts upon which the denial was based have not been realized. In concluding his opinion in the Eastern case, Commissioner Prouty said:

"If actual results should demonstrate that our forecast of the future is wrong, there might be ground for asking a farther consideration of this subject."

In deciding the Western case, Commissioner Lane said:

"We do not say that the carriers may not increase their income. We trust they may, and confidently believe they will. If the time does come when, through changed conditions, it may be shown that their fears are realized, or approaching realization, and from a survey of the whole field of operations there is evidence of a movement which makes against the security and lasting value of legitimate investment and adequate return upon the value of these properties, this Commission will not hesitate to give its sanction to increases which will be reasonable."

The condition upon which both cases were de-

Digitized by Google

cided was briefly expressed by Commissioner Lane in these words:

"It now appears probable that at the end of the fiscal year 1911 the carriers here involved will in the main enjoy earnings as high as those they had in 1910—the highest in their history."

Not until July, 1912, were the official figures available by which to test the accuracy of this sanguine prophecy. For all the railways of the United States, here is what they showed:

Year ending June 30—	1910.	1911.
Operating revenues	$2,750,667,435	$2,789,761,669
Operating expenses	1,822,630,433	1,915,054,005
Net oper. rev.	$928,037,002	$874,707,664
Net from outside operations	2,225,455	1,815,193
Total net rev.	$930,262,457	$876,522,857
Taxes accrued	98,034,593	102,657,157
Operating income	$832,227,864	$773,865,700
Decreased operating income		58,362,164

Thus was the bright augury on which the denials of advances were predicated overshadowed by a decrease of nearly $60,000,000 in the operating revenues of the railways. This, as the reader will perceive, was due to an increase of nearly $93,000,000 in operating expenses and over $4,600,000 in taxes, whereas operating revenues increased less than $40,000,000.

But this only partly reflects the confirmation of the forebodings upon which the railways based their applications. The figures for 1911 covered an operated mileage of 246,124, against only 240,830 miles in 1910, an increase of no less than 10,944 miles of track of all descriptions. As each mile of track has come to mean a capital expenditure of fully $42,000, the railway plant devoted to the public service in the United States in 1911 represented an increased investment of at least $450,000,000 over 1910. The Commission's figures show an increase of $596,980,738 investment in road and equipment for 1911 over 1910, and of $791,802,843 in gross capitalization, of which over $434,740,000 was in funded debt.

It is therefore a safe estimate to place the increase in the cost value of the railway property irrevocably dedicated to public use during the fiscal year 1910-11 at $600,000,000. On a 5 per cent basis this added $30,000,000 to the capital charge, where, as above seen, there was a decrease of $60,000,000 in the fund earned for its payment.

Labor Exacted its Full Share.

In the meantime the compensation paid by the railways to their employes showed the following substantial advance:

	Number of employes.	Total Compensation.
1910	1,699,420	$1,143,725,306
1911	1,669,809	1,208,466,470
Increase	*29,611	$64,741,164

*Decrease.

The increase in compensation in the face of a decrease in the number employed resulted from the advance in the rates of wages.

So much for the year upon whose roseate prospects the Commission in 1911 based its refusal to grant an advance in freight rates.

No Relief in 1912.

Nor did the succeeding year bring any "surcease of sorrow" to the railways. So far as can be learned from incomplete returns, something like 3,000 miles of line and 7,000 miles of track were added to the plant, accounting for an increase of over $245,000,000 invested in road and equipment. Therefore, between 1910 and 1912 there was a sum equal to at least $845,000,000 expended to provide increased railway facilities for the people of the United States. This alone called for an increase of over $42,000,000 in income. That it was not forthcoming is shown in the following comparative statement:

Year ending June 30—	1910.	1912.
Operating revenues	$2,750,667,435	$2,873,279,985
Operating expenses	1,822,630,433	1,990,061,981
Net oper. rev.	928,037,002	883,218,004
Net from outside operations	$2,225,455	$1,243,318
Total net rev.	$930,262,457	$884,461,322
Taxes accrued	98,034,593	121,797,743
Operating income	$832,227,864	$762,663,579
Decrease in operating income		69,564,285

This signified that for the fiscal year 1912, with an increase of about 8,300 miles of line and 18,000 miles of track, the railways in two years had $70,000,000 less income with which to meet annual capital charges, to which at least $42,000,000 had been added. In other words, at the close of that fiscal year they were $112,000,000 worse off than in 1910, when they made their previous application for an advance in freight rates.

Caused by the Advances in Wages.

That this condition was in a large measure due to the successive advances in the wages of employes is shown by the following statement:

	Number of employes.	Compensation.
1910	1,699,420	$1,143,725,306
1912	1,728,603	1,268,977,272
Increase	29,183	$125,251,966

As the yearly compensation in 1912 averaged $734 per employe, the increase in the number employed accounts for an increase of only $21,420,242 in the pay roll. This would leave a balance of $103,831,724 increased compensation as due to the advance in the wage rates. Independent computations based on the number of days worked place the increase in compensation due to higher rate of wages at $78,000,000.

Up to this point the advances in wages granted by the arbitrators to the engineers and firemen during the current fiscal year have cut no figure. Both are now in effect.

The Fiscal Year 1913.

The phenomenal gross earnings of the railways for the eight months ending February 28, 1913, have been seized on by the Washington representatives of the shippers as an argument against any advance in rates. Regarded in the light of actual conditions, they afford anything but a reassuring index to the railway situation. The eight months in question were marked by the heaviest traffic ever known to American railways, concurrent with the most favorable operating fall and winter weather ever recorded.

Digitized by Google

And yet the net income for the eight months was only $30,000,000 more than for the corresponding months of the fiscal year 1910, with 10,000 more miles of line and 26,000 more miles of track, representing $1,000,000,000 increased investment devoted to the public service. In the face of such exceptionally favorable conditions, the operating ratio, including taxes, for the eight months was 71.51 per cent, against 68.62 per cent for the corresponding months of the fiscal year 1910. This ratio for March, 1913, the last month reported, exclusive of taxes, was 73.94 per cent, against 71.01 per cent for the corresponding month in 1912, 69.61 per cent in 1911 against 67.14 per cent in 1910, and 66.21 per cent in 1909.

When the returns for the second half of the fiscal year 1913 are compiled, it will be found that the storms and floods of March and April will have nearly, if not quite, absorbed the gains in net income shown for the preceding eight months.

What the Situation Portends.

The case for the railways in their application for an advance in freight rates, in its final analysis, rests on the demand of the American people for adequate and efficient transportation facilities. During the year 1913 the *Journal of Commerce* estimates that $310,000,000 will be required to meet maturing railway obligations, while facilities and equipment to handle increased traffic demand the immediate investment of at least $500,000,000 new capital. The rate of interest on this financing is nearly 1 per cent higher than it was ten years ago. The city of Philadelphia has to pay 4 per cent where it formerly borrowed at 3 per cent. The city of New York pays 4½ per cent where it formerly paid 3½ per cent.

The demands of labor have reached a percentage of railway earnings that, in the language of Commissioner Lane, above quoted, "makes against the security and lasting value of legitimate investment and an adequate return upon the value of these (railway) properties."

A denial of relief will be equivalent to a notification to the railways that they must look to a reduction in wages for a restoration of the equilibrium between railway labor and railway capital, even should such restoration involve the public in the disaster of a colossal railways strike.

While the weighing of these considerations is with the Interstate Commerce Commission, their final determination rests in the popular will.

Where the advance in rates is a present necessity, to thoughtful students of the situation this must appear a temporary palliative. Before this question can be settled permanently, the people will decree that employes of an indispensable public service, subject to public supervision and regulation, are engaged in a public service which they cannot quit in a body to enforce any demands whatever. The railways have not ventured to insist on this, but ultimately the public, for its own protection, will, just as surely as, under state ownership, it would.

If in the evolution of social order human wants require that railways shall be run under public regulation *without lockouts*, human needs demand that railway wages shall be regulated *without strikes*.

At least that seems to the writer the unavoidable logic of the situation.

The Railroad Regulation Question From An Operating Standpoint*

By W. L. PARK,
Vice-President, Illinois Central Railroad.

IT has been said there is nothing more cowardly than a million dollars, unless it be two million. Already there is to be noted in the money markets of the world that discrimination against railroad investments foretold by those who knew the effect of injudicious regulation. The railroads do not "make" money; they collect and distribute it. Out of every dollar they take in ninety-five cents is returned to the public almost immediately in wages, supplies, taxes and interest. There is no magical box from which unlimited wealth can be taken to pay for the freak laws and requirements. The public must pay for it. The enormous recent increase of four million dollars in wages of already well paid employes has raised prices thirteen million dollars, according to ex-Secretary of Commerce Nagle, in his report to Congress. Railway taxes are increasing six million dollars per annum; fuel and other supplies are going up until surpluses are about exhausted and rates must be materially raised or these inroads on the revenue stopped.

The demand for both service and safety is becoming so acute that it is well to ponder who and

*From a paper read before the Transportation Club of Peoria, Ill.

W. L. Park.

Digitized by Google

what is mostly responsible for anything that may be lacking in these particulars.

Through the curtailment of surplus earnings by unreasonable regulations and imposition of costly, pernicious and aesthetic laws and orders, have not our Legislatures and Railway Commissions assumed the responsibility of protecting the business interests? An analysis of the majority of enactments affecting railroads indicate all sorts of requirements which load down the railways with increased operating expenses and revenue curtailments to a point where some of them have staggered on to the precipice of a receivership and all that it means in retrogression of service and confiscation of railroad investments.

After years of this practice and consequential curtailment of available improvement funds, attention is now being turned to coerce beyond possibility of compliance the immediate provision of facilities which make for real safety and betterment of transportation facilities—provisions which the operating men have been advocating and making of their own accord for years back, so far as the available money would permit. No one bemoans more than the operating man that railway regulation (or irregulation, should we not better call it) has taken away from him so vastly the means by which these measures for real safety and service can be made.

The major responsibility for American railroads not being more completely equipped with stable track, automatic block signals, interlockers, steel cars and more adequate facilities to perform the transportation required by present commerce rests not with the manager, but with those who have foisted such ill advised and costly laws and orders upon the railroads.

Contemplate the vast sums that have been taken away from the railroads, uncalled for, in rate reductions and unreasonable laws and decisions—sums which would have been more than ample to have brought the railroads to a high state of physical perfection.

The commencement of this depletion of funds was started when many of the lines were in an extremely primitive condition, and in which condition many of them will always remain owing to the small margin of profit, or absence of surplus, out of which the property may be brought to a higher state of physical condition.

Does the constant cutting of rate after rate tend to promote safety, or insure adequate supply of cars and the desired movement thereof? Yet every Commission points with pride to this pseudo preservation of public welfare.

Is welfare measured in this manner comparable with what we are now suffering?

Does excess passenger service tend to promote safety, or the best performance of that service which is really needed?

Do depots which are ordered more to meet an aesthetic sense than real need make for safety, or conserve funds used in that manner for use in enlarging those facilities which are actually required to move traffic? A wave of civic pride in the appearance of cities, towns and villages has been sweeping the country. At most points this is first manifested by requests from commercial clubs and other bodies of citizens for a new depot. Finding that such a depot is not required from any consideration of physical discomfort so far as the existing facility is concerned, we point out the inconsistency of the request, which then turns into a demand. At one point on our line we recently authorized a ten thousand dollar depot. This was done not because we could properly spare this amount from other necessary facilities; not because the citizens of the town were suffering physical discomfort; not that we believed money should be spent to please the eye architecturally before it is spent to provide needed facilities, but because of coercion of uplifters and railroad commissions. The plans were gone over by the Town Club and I received recently a letter from the president thereof which read in part as follows: "Unless you provide a steam heating plant, flexotile floors and a tile roof, we will sic the Railroad Commission on you or get out an injunction."

You will agree that is not the sort of co-operative spirit between commercial business men which is required to promote the best interests of both. It is a far cry between that spirit and the spirit which permeates the good fellowship of the Peoria Transportation Club. It is the unnecessary, unreasonable and foolish things we are required to do that are eating the life out of the railroads.

Do full crew bills contribute as much to safety and service as a strong permanent road bed, steel cars or automatic signals? In the State of New York the operating department has but recently had saddled on their shoulders this utterly useless and wasteful "full crew bill," which adds $2,000,000 to their annual expense. This then seemed to arouse the prowess of the legislators across the State Line in New Jersey; they adopt a full crew bill and then try to outdo their neighbors in the matter of "eating" up the railroads by promoting a highway separation bill, saddling the entire cost of $75,000,000 or $100,000,000 upon the railroads. Mark you, that this $2,000,000 to be paid annually as a premium for loafing in the caboose and the seventy-five or hundred million dollars for street and highway separation work must come ahead of any funds which might otherwise be spent for more locomotives and cars and improved terminals and trunk line facilities—the things that this counrty needs more than anything else so far as its almost complete dependence upon transportation is concerned.

A full crew bill is class legislation and special privilege of the most dangerous kind, as it enables one body of workers to seriously affect the economic status of the public at large, and in this instance there is no one that really benefits, unless it may be through a slight decrease in the premium rate of organization insurance.

Occasionally we find a public officer whose integrity and sincere opposition to class legislation makes him speak as Governor Cruse, of Oklahoma, did with respect to the full crew bill he was recently asked to ratify, namely:

"Another thing I have learned to believe is that those who have made a lifetime study of railroad operation are better judges of the proper method of operating them than I am, and I believe that this is equally true when applied to a majority of the members of any legislative body. The trouble in Oklahoma is, and has ever been, that in dealing with public service corporations we have assumed to know more about how properly to operate them than those who have given the matter careful study. Public service corporations need to be regulated and need to be controlled. Oklahoma has undertaken to do this by the creation of a corporation commission and has

Digitized by Google

clothed that commission with unusual authority in dealing with such matters. That commission, after having studied the question, is better able to place suitable regulations upon the railroads than is the Governor or the Legislature."

The same bill is now before the Legislature of Illinois and every business man and farmer in the State should insist that it be killed. If more men are needed on the trains, the Railway and Warehouse Commission will request it and their request will receive attention.

Do blinding and signal confusing electric headlights contribute so effectively to safe operation of trains as automatic signals? Careful tests and investigations by unbiased experts and authorities say not and all practical railroad men know positively they do not. Yet fourteen States feel considerable complaisance over having such a law on their statute books, alleged to have been promoted by concerns who have such devices to sell.

Does the recent extension of the Federal Safety Appliance Act, which provides for refinements in freight car construction, do as much to save lives of employes and passengers as the block system and steel cars? This will cost $50,000,000. Think how far that sum would go in promoting real safety and betterment of service. It would purchase fifty thousand freight cars or two thousand of the most modern freight engines.

Do the heavy fines imposed for not submitting unimportant reports through inadvertency of some clerk, or for not releasing a crew from duty under impossible conditions, subserve the public interest more than the essentials?

Is the expenditure of large sums of money by the railroads to protect themselves against unreasonable and unscientific application of the Safety Appliance Laws, relating to minor and insignificant parts of cars or engines, conducive to true economy or right methods of accident prevention? Every experienced railroad man will tell you it is not.

Do laws regulating the kind of cabooses to be used in train operation add nearly as much to the end desired as signals, steel cars, better roadway, bridges, more side tracks, or terminal facilities? Yet sixteen States seem to think so.

Does a recent cut of $25,000,000 a year, which is that much less than is admittedly a fair return for railway postal service, contribute to a physical betterment of railway operation which makes for safety and service?

To all of these every railway manager can answer a conscientious and emphatic "NO."

And now, when every ounce of skill he may have acquired after long years of painstaking and observant experience should be concentrated on getting the greatest amount of transportation out of his restricted facilities, he is obliged to turn instead a great part of his effort to convincing a newly elected body of legislators or railway commissioners that countless laws and orders are inconsistent with the best interests of the shipping and traveling public. Failing or being arbitrarily disregarded, he is burdened with an annual deluge of useless and costly legal "musts" and "must nots" which of necessity make every employe in the operating department an almost daily violator of his country's laws. To observe strictly the hundreds of railway laws and orders in effect today, he must be nine tenths technical lawyer and one tenth practical railroader.

Observe the following few, very few, examples of additional regulative absurdities, the conflicting ideas of which in the different States should be reconciled: In one State we are told by the Board of Health that linen covers should be applied to the head-rest of coach seats; in the next State we are told that they are unsanitary. One State wants dust boards in the coach windows; another does not care for dust boards but wants fly screens. One Commission wants the flagging done in a certain way; the next State does not agree and demands that a different method be employed. One State requires that the locomotive whistle be continuously blown while passing through towns and villages; another makes it a criminal offense to blow the whistle under such conditions. Water cannot be put into the cars without it being certified to. The source of ice, stored the preceding winter must be traced and a certificate provided showing its purity. One State fines us if our passenger trains are late, another penalizes us by drastic court decisions if we make the schedule and anyone is injured. One community wants coal consumed on the locomotives to help its mining interests; at the other end of the division they demand electrification to help those who furnish electricity and electrical supplies. Orders are obtained from the Commission in one State to erect union depots at all junction points, notwithstanding the fact that the tracks of the respective railroads are far apart. In no State the railroads are compelled to fence their right of way. Public sentiment won't permit the gates to be kept closed, and in other States the right of way is used legally as a pasture. Railroads are required to spend millions for track elevations, and then are refused aid to keep trespassers off such elevations.

Many Federal laws are now pending which are absurd, inconsistent, unreasonable and impossible of compliance, such as House Roll 28230, requiring all locomotives to be equipped with the La Croix Control System. Another by Congressman Richardson to compel the use of the Cain-La Barre system; one by Dent requiring the railroads to adopt within five years some form of safety device to prevent derailments, he don't know what—it is as yet to be invented—a genius must be created like Edison and by the railroads; one by Brown to require the use of the Jennings' combination tie. There are numerous headlight bills requiring the use of electricity, acetylene gas, some with flash lights, others with vertical rays; one to regulate speed, another to require all cars to be made of steel; one to require the Government to take over all the railroads so there will be no more accidents; one to investigate methods in vogue in repair shops in the interest of so-called efficiency experts, and one by Congressman Lafferty, House Roll 27724, requiring common carriers to furnish names of all witnesses to plaintiff or his attorney in case of accident and personal injury; one to prevent the transportation of white slaves; others, to fine the railroads for transporting whiskey, beer or adulterated articles of commerce, impure seeds, women or butter; one by Kenyon of Iowa inflicting a fine against the railroads of ten thousand dollars with imprisonment for transporting the product of any mill or factory where females have been employed more than eight hours per day or more than forty-eight hours per week; an Anti-Option bill to prevent a railroad from getting right of way at the market price; one by Culty to reduce the hours of labor on railroads; one by

Digitized by Google

Congressman Berger, the United States to acquire the railroads to prevent strikes of firemen and others.

Numerous compensation and workingmen's liability bills, several to prevent protection of railroad property in case of strikes by invoking Federal aid—the Crawford bill became a law March 4th, 1913, regulating injunctions in the interest of rioters. There were 855 bills before the last Congress designed to make railroad operation more costly without compensatory benefits to shippers.

Nearly all of this uplift legislation is unnecessary, antagonistic and expensive. It is born of a desire to please the rabble or to pay political debts.

And now, our would-be regulators sit back appalled at the loss of life and deficiency of service as compared with the foreign lines and deplore that more has not been done in this country to promote real safety and service. Who is responsible?

Naturally, following such publicity and continued exciting and inflaming of the public mind against the railroads, come extremely pernicious court decisions which we cannot avoid and meet service demands; consequently the railroads are compelled to bear the burden of heavy and unjust judgments and charge it into the expense of the service, and you business men must pay the bills.

We have been told by the Supreme Court in one State that a railroad has no right to run its trains faster than six miles per hour within limits of any city, town or village, nor faster between towns than will enable the train to be stopped within the distance a headlight may reveal a person walking or standing on the track. That means, under the absence of trespass laws, that every few minutes, if he comply with the law, an engineer must slack his passenger train to five or six miles per hour, because ahead of him walking on or to one side of the track is a person, who, through suicidal intent or carelessness, might step on the track—and to carry out the intent of the ruling so as to surely exempt the company from any liability for personal injury he must bring his train to a stop upon reaching the person, as he might step on the track just as the engine comes on him. In other words, it means that the engineer must virtually ask this trespasser if he may run his train by him. Failing to observe such speed restrictions the railroad is held prima facie responsible in personal injury suits, and judgments are rendered in trespass or other cases on this basis alone—forty thousand dollars for the death of a minor trespasser recently.

To provide you business men with the prompt and efficient service which you demand and ought to have, operating men must take chances under these laws and decisions, and must rightfully look to you for reciprocity and protection. If we were to literally observe them as being the representative will and judgment of the public, it would absurdly lengthen freight and passenger schedules to exasperation and ruin.

High speed does not save the railroad money; on the contrary, if the greatest efficiency of the locomotive could always be obtained, our earnings would increase vastly, the exemption from accident would be greatly increased.

If all the foregoing costly interferences and progress-retarding rules, laws, opinions, orders, ordinances, awards, judgments and what-nots are not the real will of the people, then public spirited citizens, as occurred recently among the business men and farmers of Texas, who are interested in real genuine improvement in our transportation facilities, who are not restricted in their actions by temporary self-interest, should assume a demonstrative and convincing leadership in arousing the public to manifest its disapproval of the multitude of disconcerting mandates turned out by their law making and governing representatives.

It is to be noted that where the operating manager has been enabled, through the business men, to present his need of freedom from regulation in his work of running trains direct to the people, the legislatures have usually been reversed. It is essential that the people shall be afforded the right sort of argument from practical men, upon which they can base their conclusions, and unless the business men will come forward and analyze in a thoroughly practical manner the import and effect of present and impending laws affecting railroads, the people will be left to base their conclusions on the biased or un-American utterances of the political demagogue, or those ignorant of important matters,—their cause and effect.

The people of the United States, by reason of the quasi-public nature of railroad business, are distinctly partners in the work of perfecting the railroads of this country to a highest possible condition from the standpoint of safety, comfort and service. Thus being partners they have elected railway commissioners to conserve their interest in the development work. Consequently, such commissioners have become railway regulators and as such must assume even greater responsibility than railway officials in the matter of bringing about a proper condition, for they have largely taken away the means although now expecting the result.

It is believed that if the present situation is thoroughly and conscientiously analyzed, it will be admitted that in the majority of cases, if the technical questions had been left more in the hands of those who are skilled by long years of experience and training, the public would to-day have a much higher standard of railways in point of safety, service and physical condition, with an era about to dawn when rates could be legitimately reduced much below any plane that is not now confiscatory, because they would have had the funds to use in directions and in the sequence which they best know would enable them to to-day operate more cheaply and satisfactorily than it is possible under the curtailed improvements which it has been possible to make with the revenues permitted them. This has been conclusively demonstrated in that those sections of the United States where railway managers have been least interfered with in working out the problems of superlative railways and economies, they to-day have the most satisfied public.

It is not alleged that all of the regulation imposed on the railroads is without a conscientious belief that the particular effect produced is of greatest benefit to the public, but there is much of it—and much of the public antagonism engendered—for political preferment rather than through any sense of sincerity.

We must admit that some of the actions, but partially and briefly told in the foregoing, taken to regulate railroads are inconsistent and productive in the long run of an effect opposite to that desired, because our method of appointing railway commissioners is in many States elective, not economic, and frequently an entire commission

Digitized by Google

may be composed of men, who up to the day of their taking office, have never had any experience in the operating or executive end of the railway or any other business—they may be men who have devoted their entire lives to a professional calling, such as doctors, lawyers, teachers and others with less qualifications who have obtained their position entirely through political influence.

There is no open sesame to the problem of railway operation and management, so that any one, regardless of previous experience or particular fitness, can assume authority and within a day or two issue orders intended to improve methods which are the outgrowth of many years of careful and painstaking analysis to determine what is best. On the contrary there is no other business which is so complicated and requires such a variety of highly skilled talent of long experience. Yet behold our "hit or miss" plan of railway regulation—rule in effect anything that the moment suggests, without regard to the whole. First take away from the railways through rate reductions millions of dollars, which they are trying to save up for thousands of freight cars, and then order them to furnish the cars anyway.

Is there not in the field of railroading to-day an actuality in regulation, which, although comparatively as sensible, would be pronounced ridiculous and highly impossible in other fields? For instance, the medicos have in their hands the health of ninety-five millions of people. In constituting our commissions to regulate the medical profession, do we put railroad men on them who, until the day of their appointment, know nothing about medicine? Is it not as consistent for a doctor to prescribe just what shall be done on each mile of railroad as it would be for a railroad man to prescribe how many grains of calomel should be administered to every patient?

There is a true saying that "Seamen are made on the sea." Those who must assume the responsibility for movement of trains must make the rules and enforce them. The greatest difficulty is well known to be in enforcement. It is the disposition of mankind to resist discipline. There are two ways in which it may be obtained—by placing the forces on honor and by punishment. The former undoubtedly governs the largest number of railway employes. There are a few who are so constituted that honor means little; who chafe at discipline. It is this class who make the trouble on the railways, as they do in the army and navy, and in every walk of life. They cannot be eliminated from the service until they have committed some act which proves their incompetence.

If the public will accept the verdict of the manager in case of accidents and withhold its maudlin sympathy from the criminally negligent, they can be assured that the organizations will see that injustice is not done their members. If they will support the managers, as they do the civil authorities, there will be fewer accidents due to the human equation which now composes eighty per cent of the whole.

When findings in accidents are put out to the public containing insinuations of "gross negligence of officials," it is a serious personal reflection on their integrity, ability and sense of moral obligation. Before such drastic accusations are brought against any one, it should be first determined what justly constitutes dereliction of official duty. Is it gross negligence to have failed to do that which it is utterly impossible to do? Six years ago the first steel passenger car was built. That was the greatest humanitarian step in the preservation of lives, even more than the perfecting of the automatic block signal. Is it dereliction if a single wooden car is to-day used in trains?

Automatic train control devices are now in process of evolution, and a special committee of the Interstate Commerce Commission has been giving their design and dependable efficiency close consideration. The president of the New York, New Haven and Hartford Railroad, with other officials now on trial for manslaughter, has offered twenty thousand dollars to the inventive genius who will furnish such a device that is practicable and offers to install it on his railroad, if approved by the Interstate Commerce Commission. If that body should to-day stamp their approval on any such device, would it be dereliction of managerial duty should an accident occur next week, which might have been prevented if such a device were in use? Should not the judgment of an official's character be made on the basis of that which is possible and the exigencies of the process of evolution?

The trouble generally with our present railroad regulation is that it is extremely "wishy washy," and does not pursue or even recognize any comprehensive or matched up scheme; it consequently often becomes dangerous and more often ridiculous. No consideration whatsoever is given to how seriously a law or order may clash with the general plan upon which railroad operation must be matched up, and if we cannot show that an order contains specific objection within itself set apart from the general plan, it is thrown at us to obey.

Laws are ordinarily placed on our statute books to correct purposeful wrong doing—but in the railway field now laws are being passed by the scores, not to correct purposeful wrong doing, but to exact impossible perfection. What is the effect of passing a law which the framers, as well as the public, know is impossible of compliance? It throws that law, and ultimately the entire jurisprudence, into contempt, and we become a disobedient Nation. This is not mere soliloquizing—the effect is apparent on every hand.

I cannot in fairness continue indicting railway regulators without strongly emphasizing the fact that some of our commissioners are able and broad minded men, and from their energies we suffer but little disorganization and frequently much support, and it is significant that where we find such a commission we find men whose appointments are economic and who have long held their office, in consequence of which they have been able to gain the requisite knowledge of the affairs which they are to administer. Gentlemen, it is gratifying for me to say, and perhaps for you to know, that you have in the State of Illinois the sanest and most all around conscientious railway commission it has been my pleasure or pain to meet.

You have, perhaps, had your mind glutted with an avalanche of yellow journalism in newspapers and muck raking magazines, harping on the number of fatalities due to the inefficiency or neglect of the American railway operating man. If you will examine with me into our records, I think you will find that we are not so bad after all; that we are steadily diminishing the number, and that we are far less censurable than our public officials in their dereliction along certain lines of life

Digitized by Google

protection—namely, trespassing, murder and disease.

The loudest condemnation and allegations of dereliction of duty on part of railway managers arise out of the number of passengers killed in accidents to passenger trains. During the fiscal year ended June 30th, 1912, such deaths amounted to forty-nine in collisions and sixty-five in derailments, a total of 114. Let us see how the alleged inefficiency of railway managers, which caused these 114 deaths, compares with deaths growing out of the inefficiency or temporizing of public officials.

Comparing the year 1912 with 1888, we find an INCREASE of 47 per cent in the death rate per million of population, due to trespassing; an INCREASE of 175 per cent in the death rate due to murder and a 69 per cent DECREASE in death rate due to passengers killed in accidents to steam passenger trains.

Is not that conclusive—47 per cent increase in the number of trespassers killed since 1888, and yet practically nothing has been done by public representatives to avoid this loss of life. Is it not the moral duty of the public to protect the lives of citizens who may be walking just as much as those riding on trains?

The ratio of murder depends on the education and control of the human equation just as the diminution in fatal train accidents depends largely upon the control and education of railway employes. The operating official's education and control of his men has brought about a 69 per cent decrease in the ratio of deaths to persons entrusted to his care—quite in contrast to the inefficiency and neglect of public officials displayed in the 175 per cent increase in the ratio of murder.

During the fiscal year 1912 there were an average of three tenths of one passenger killed in passenger train accidents each day as against 14.8 persons killed each day while trespassing—practically fifty times as many trespassers killed each day as passengers. Yet there are only nine States in the entire Union that have even fairly satisfactorily trespass laws, and they are all indifferently administered.

The self appointed uplifters harp on the criminal negligence of railway officials in connection with the death of these 114 passengers. If it is true that it is criminal negligence (which, however, you know is not true) then there is no expression which can adequately enlarge on the stigma attaching to the failure of public officials to prevent the death of fifty times as many individuals trespassing and eighty-five times as many murdered. Should not public censure be turned entirely in the latter directions and let the railway officials work out their own problems, which they have shown themselves able to do?

There is a much needed awakening among those who administer the laws and in what Governor Brown, of Georgia, said recently, concluding a speech at Atlanta, we see developing a strong tendency to invoke the protection of the law against injustice to the railroads:

"Now, in all that I have said I have passed no judgment on the merits of the differences between the railroads and the employes. I say not which is wrong or which, if either, is right. Their differences do not constitute the real issue which has been the logical result of the recent happenings. That issue is found in the question 'Shall the laws of Georgia be equally enforced, or shall one class of the people be permitted to ignore the courts and inflict, it may be, irreparable damages upon multitudes of others in its quarrel with its adversary while all other citizens must submit their contentions to the determinations of the courts of the State?' Or in other words, 'Are the laws of Georgia subordinate to combinations working for their selfish interests in such manner as inflicts injury on the general public?' "

That any business man who takes an active part in restoring the railroads to their proper place in the regulative field may not fear that he has no precedent of a totally unbiased citizen, I quote what Charles A. Prouty, chairman of the Interstate Commerce Commission, said on March 28th in speaking of the "Future of Railway Regulation":

"Every intelligent man knows and must feel that it would be a rank injustice to require railway investments to earn less than other investments of the same grade. Every intelligent man must know that to force down railway charges below a fairly remunerative point would so impair the credit of our railroads as to prevent them from properly discharging their functions as public servants. When honesty and public interests combine to secure to our railways rates which are fairly compensatory I cannot believe that this privilege will ever be denied. If the time does come when railway property is sacrificed to popular clamor, when the public demands its confiscation and the regulating tribunal concedes that demand, no property will be of much value. The day will have to come when the obligations of private rights is no longer observed."

The continued withholding of a fair regard for the honest, earnest effort and ability of the railway operator is more and more tightly binding his hands in their consistent effort to give what you business men and the public you serve want. You are practical and we railway operators are practical as we came up through the same toilsome path that you did. Not having been unjustly vilified, as yet, by the demagogue as we have, you are still able to wield a strong influence over the public mind in turning it back to practical channels, away from the will-o'-the-wisp philosophy and activities of the railroad baiter.

It may be said of some State Legislatures, "It is excellent to have a giant's strength; but it is tyrannous and ruinous to use it like a giant."

ALL WE ASK IS MEASURE FOR MEASURE.

Smoke Evil Report.—What is expected to be the most comprehensive report ever prepared by experts in this country on the railroad smoke nuisance and means for abatement will be presented at the annual meeting of the American Railway Master Mechanics' Association in Atlantic City, June 11th to 13th next.

An extended series of tests have been made of various grades of coal used for locomotive fuel and of a number of smoke preventing devices. All the data will be incorporated in the report being prepared by a committee.

The Railroad Situation of To-day

By BENJAMIN F. BUSH,
PRESIDENT OF THE MISSOURI PACIFIC RAILWAY.

A CAREFUL and impartial analysis of the railroad situation as it exists to-day, irresistibly forces the conclusion that there is no subject before the people, no policy engaging the attention of the Government, that in its future economic aspect foreshadows more dangers, both to the commerce of this country and to our institutions, than does that of railroad transportation; therefore that it be solved rightly it should receive the most scrupulous consideration.

The wonderful commercial progress of the United States has been made possible only by the railroads. Since 1870, when the impetus given railroad construction began, the wealth of this country has increased from thirty billions of dollars to the enormous sum of 140 billions. Its foreign commerce, in the main largely dependent upon the railroads, from eight hundred millions of dollars to four thousand millions. The internal commerce of the railroads to-day has reached the stupendous figures of over two hundred and ninety-three billions of units of service—being the tons of freight hauled one mile and the passengers carried one mile.

The volume of this railroad commerce has nearly doubled in twelve years, and taking cognizance of the alert and progressive spirit of our people and our still latent and undeveloped resources—in farm, mine, forest and factory, an alluring promise is foreshadowed for a continued increase.

The fulfilment of this promise rests entirely upon the ability of the railroads to improve their existing plants to a higher state of efficiency, to extend their lines into the undeveloped regions and thereby provide the necessary facilities for the prompt movement and distribution of the products arising from the awakened activity. The commercial supremacy of the world is the heritage of our Nation if the means at our command are wisely applied.

As to how the railroads can secure the money necessary to make the improvements and extensions to efficiently provide for the carriage of the existing and increasing traffic, so that all lines of industry may develop and operate to full advantage and our vast tide of commerce still further expand and flow unrestricted to its final haven, is "The Railroad Problem."

As the conditions are to-day, by reason of not having the means at their command, the railroads, with few if any exceptions, cannot give proper movement to the large volume of existing traffic. This was likewise true in 1906, 1907, 1910 and 1912. The transportation facilities are not keeping pace with the increasing traffic requirements.

At the period of their inception, railroads were crudely constructed, but they supplied the needs of the time in moving the sparse traffic then offered for shipment. They were built on the lines of least resistance to meet the varying characteristics of the contour and topography of the country traversed. Later, with the growth of traffic and more urgent requirements, radical improvements had to be made to meet the changed conditions. Practically the lines had to be almost rebuilt—in reducing grades, eliminating curves, replacing wooden with more substantial steel and concrete bridges, widening roadbed and embankments, ballasting track, deepening and widening ditches, constructing cross-drains, building viaducts over road crossings, building sidings, passing and double tracks, providing heavier rails and ties, larger engines and cars, spacious terminals in large cities, more commodious station buildings, engine houses, shops and many other appurtenances. As the means have permitted, this work of rebuilding and enlarging and improving the roadbed and equipment has been prosecuted, so that a higher standard of service and efficiency might be forthcoming. Billions of dollars have been already expended in this work, but much yet remains to be done before the roads reach that stage of completion that the constantly increasing traffic can be satisfactorily handled. This will require more billions of dollars. The money cannot be supplied from earnings. On account of inadequate compensation for service rendered the earnings in many cases are scarcely sufficient to maintain the properties in a solvent condition.

BENJAMIN F. BUSH.

How then can this necessary capital be obtained? A railroad to obtain money for extensions into new fields or for the improvement of existing lines must, like a merchant, have an established credit. It must be able to show by past or current operations that it will be able to meet the new interest obligations it assumes and have a surplus over and above all its requirements. Not many railroads are able to do this under the existing operating conditions of high wages paid

Digitized by Google

for labor, increased cost of materials, the higher standard of service demanded by the people, and governmental compulsory expense and regulation of charges for transportation.

Legislation of the most onerous character has in recent years been enacted by federal and state authority, entailing numerous expenditures without any compensatory provision, many of the acts being entirely without beneficial results to the public and only an economic waste. Three or four bills now being urged upon Congress are estimated to involve an expenditure by the railroads within the next four years of nearly a billion and a half dollars.

These many expenses over which the railroad manager has no power of control have steadily increased the cost of operation, and as the unit of compensation for transportation service is regulated by federal and state authority and is more often reduced than advanced, it follows that the unit of profit is steadily decreasing. If these two opposing units of conditions, cost and compensation, are allowed to continue in their course, it means they will meet in time and all profit will be expunged.

It may be thought, however, that the revenue derived from the increased business will more than offset the increased expense. Such is the view of the ordinary layman who has given the matter only cursory study. If the roads were not working to their full capacity—that is, if they had unused engines, cars, tracks and terminal facilities, they could to some degree for a time offset the increased expenses by additional earnings, but when as in 1906, 1907, 1910 and 1912 they were burdened with business beyond their capacity, the excess entails an expense much greater than the average cost.

The gross earnings of the railroads increased largely during the last half of 1907, but notwithstanding this, the net earnings decreased over twenty-two million dollars. For the last six months of 1910 the gross earnings increased over fifty-five million, while the expenses increased over eighty-four million. The volume of traffic moved in those years was very large and for many months was in excess of the capacity of the carriers.

The Interstate Commerce Commission in 1907 declared that the inadequacy of transportation facilities was alarming, yet when the railroads sought to advance their rates in 1910 to enable them to make better provision for the public demands and establish a higher financial credit, the Commission would not sanction the advance. The earnings for the roads for the two following years, 1911 and 1912, increased $11,054,000, but the operation expenses and taxes were swelled $98,544,000, leaving a less net revenue for 1912 than for 1910 by $87,490,000. This loss was equivalent to the impairment of their ability to raise over two billion one hundred and eighty-seven million dollars at 4 per cent. It is thus that the net revenues of the railroads are depleted and their inability to borrow money is further emphasized. If the railroads could retrieve such yearly net losses, they would be able to strengthen their credit in the financial marts and raise the necessary funds to meet the exigent demands of the business public.

It is a mistaken conception though one generally prevalent, that the railroads are overcapitalized and seek to obtain exorbitant rates from the public to pay interest on the excessive capital. The fact is that the physical properties of the railroads could not be duplicated to-day for anything like the present capitalization. The money of the owners which has not been capitalized, that has been expended on the roads from year to year since their pioneer days, in betterments and improvements, roadbed, equipment and their accessories, has long since absorbed any water there may have been in the securities.

Such high authority as the Interstate Commerce Commission declared some time ago that the value of the physical properties of the American railroads was more than that represented by their stock and bonds. This capitalization is less than one fourth that of the English railways and less than one half that of the roads of Europe's Continental countries; yet high as this capitalization of foreign railroads is, they are permitted to charge such rates as yield reasonable net returns.

The average rate received by the United States railroads for hauling a ton of freight one mile is three quarters of one cent, while the rate received in England for a like service is over two and a quarter cents, or three times as much. The rates of other European countries are also much higher than ours. As has been well said by Mr. Hill, "The American railway pays the highest wages in the world out of the lowest rates in the world, after having set down to capital account the lowest capitalization per mile of any of the great countries of the world." He might have added, they also give the best service in the world.

I believe it can be truthfully said that the causes of complaint in the past against the railroads have been entirely eliminated. The published tariff of charges accessible to all governs to-day, without discrimination or favoritism to any shipper. Complaints may arise and do arise as to rates on specified commodities between given markets, on account of their relation to the rates on like correlated commodities to and from other markets. These complaints grow out of the rivalry between communities and are the main grievances of shippers now brought before the Commission.

Shippers naturally endeavor to get the lowest rates possible, and from the standpoint of their individual interests they believe that unjust inequalities exist in rates, although such inequalities may be the result of inexorable economic laws beyond the carrier's power to control. In the adjustment of these differences between markets or rival communities, the decision of the Commission is almost invariably in the direction of reducing the higher rates to the lower level. In this way there is a constant nibbling at the rate fabric, which ultimately will prove as injurious as a wholesale reduction.

It is axiomatic that mutuality of interest exists between the railroads and the shipper: that one cannot prosper unless the other does and that injury to one will later bring injury to the other. If the shipper is charged unreasonable rates or is afforded poor service for the transportation of his wares, he suffers in his busienss and this in time reacts upon the carrier. On the other hand, if the carrier receives insufficient compensation for its service by reason of inconsiderate legislation, or by unwise direction of regulative authority undue burdens are imposed which increases its expense, then it may for lack of means be unable to maintain its former standard of service and thus the shipper and the carrier are both injured.

I recognize that the railroads are in duty bound

Digitized by Google

to serve the public in the best possible manner and that the public, through the state, has the authority to regulate their operations, but when that authority is exercised with reference to the most minute and varied details, burdening the carrier with an unnecessary expense, which it cannot afford, then it would seem only just that the public, through the state, should allow it the necessary protection in the way of maintaining compensatory rates. This is on the principle that the right to regulate or control carries with it the obligation of reasonable protection. Authority carries with it responsibility and control imposes the duty of protection. I believe that the same principle of justice should be administered to an association of individuals known as a corporation as is administered to the individuals personally in other capacities.

Considering what the railroads have done through the investment of private capital—in upbuilding and developing the country, improving the conditions of living, uplifting the people and adding to all the comforts and conveniences of life, they certainly are entitled to that necessary protection which will enable them to continue in their vocation and elevate to a still higher plane the social, commercial, industrial and agricultural conditions of our people.

An eminent public official, an authority upon this subject, has said: "No just legislation upon this subject will proceed upon the theory that the public alone is in need of protection and that the railroads can take care of themselves. I have no sympathy with such an unfair and illogical contention."

The United States census returns show that from 1900 to 1910 the capital value of agriculture increased from nearly twenty and a half billions to forty-one billion dollars, or 100 per cent, and the capital value of manufactures increased from nine billion dollars to nearly eighteen and one half billion or over 105 per cent, while the capital of the railways increased from ten and a quarter billion dollars to less than fourteen and one half billion, or only 40 per cent.

Here we have an increase in the capital of thirty billion dollars in those two important industries of agriculture and manufacture which are almost entirely dependent upon the transportation lines for their successful operation, whereas the caiptal of the transportation lines with their many appurtenances increased only to the value of four and a quarter billion dollars.

And again, we find that the value of the products of manufactures increased from eleven and one half billion dollars to over twenty and one half billion, or 81 per cent. As the railroads get a double haul on a large portion of manufactures—the raw material in to the factory and the finished product out, it may be judged how essential it is that they keep abreast of the times in road and equipment to properly take care of the constantly increasing tonnage implied by these enormous values. The largely increased volume of agricultural products, which last year exceeded nine billions of dollars in value, must meet with more prompt consideration on the part of the carrier, for through the economic conditions governing, the greater portion of it is rushed to market within a limited time.

The census further shows that notwithstanding the large increase in the capital of manufactures of 105 per cent, the net return to the owners on the total of twenty and one half billions was over 12 per cent. Yet on the railway capital there was nothing paid on three and one half billions, and less than 5 per cent on seven and one half billions. The services of the railroads make secure the most liberal returns on the enormous capital of fifty-nine and one half billion dollars invested in these two industries, and therefore the manufacturers and farmers should willingly aid in an effort to get the transportation rates advanced. It is of paramount importance to their own continued welfare that they exert themselves in that direction.

I have already alluded to the immense volume of traffic conducted by the railroads and to the fact that it has increased double-fold in twelve years. Will it continue to increase in the same ratio in the coming years?

The marvelous resources and latent strength of this country are in many respects scarcely trenched upon. Of the total land area of the country 46 per cent is in farms, but of this land in farms only 54 per cent is improved. Only 25 per cent of our great domain is producing anything of value. My friend, ex-Governor Hadley, of Missouri, when in office, stated in a public address that the development of Missouri's natural resources had scarcely begun; that there were three counties in the state wihch had no railroads and seven counties with less than twenty-five miles; and that of the forty-four million acres of land in the state more than one half had never been touched with a plow. A like statement is applicable to many of our Western and Southern states. The opening up and cultivation of these undeveloped lands by the building of railroads would give a further impetus to general trade and industry.

Then again, our farmers are now awakened to the benefits to be derived from the application of scientific methods in agriculture and more intensive yields will be the result. A more careful culture of our wheat lands will easily double the yield and still be less than that of European countries, whose land has been under cultivation for more than two thousand years. A like increase can be effected in the other cereals and products of the soil. Our project for the reclamation of the swamp and arid lands goes on apace.

There are vast mining lands with their hidden treasures yet awaiting development. The completion of the Panama Canal will open to us more directly the trade of the Orient and Western South American countries with their hundreds of millions of beings whose wants may be supplied with our merchantable wares. The value of our exports of manufactures is now over one billion dollars annually, and at the present rate of increase it doubles every three or four years. Our foreign trade in other commodities is taking on a greater momentum.

In all these we have a magnificent vista of possibilities which portends the continual upward trend of our trade and commerce with its concomitant of future steady employment for our people—the desideratum of all governments. The illimitable prospects betoken its continuance if ample provision is made for transportation.

Now, with the present traffic of the railroads reaching the stupendous figures of over 203 billions of units of service, what will the future increase mean if kept up in the ratio of the past?

You all know something of the capacity of the New York Central Railroad within your own

Digitized by Google

great state, and the magnitude of its operations and transportation facilities. Four per cent of the volume of traffic now annually moved by our railways would at the present day tax the full capacity of that road, working day and night for one year. As the railroads operated to their full capacity in years of active business, like last year and other past years, an idea may be formed from this illustration of the magnitude of the work that will have to be done in fitting response to the demands of commerce. The commerce is increasing on an average of 8 per cent and more per year, and notwithstanding one half of this yearly increase would tax the capacity of one of the first railroads in the land, no provision is being made and no provision can be made under the rates now received for transportation service for the proper and safe conduct of this prospective traffic.

Can the railroads meet this serious situation with which they are confronted? Yes, if allowed to charge a fair compensation for their services. The railroads now receive on an average per mile seven and a half mills for hauling a ton of freight and less than two cents for carrying a passenger. If this average compensation could be increased even one mill a mile, or the equivalent of the price of a postage stamp for twenty miles' service, it would extricate them from all further trouble and anxiety. It is scarcely conceivable that such a slight advance would injuriously affect any trade, industry or person, yet it would be the means of conferring untold benefits upon the entire business of the country.

The honorable Martin A. Knapp, late chairman of the Interstate Commerce Commission, who had twenty years' experience on that board, after a careful study of this question from all viewpoints, expressed his deliberate judgment as follows:

"Without regard to the personnel of railroad officials, without regard primarily to the interest of stockholders, but in the interest of public welfare and National prosperity, we must permit railroad earnings to be adequate for railway improvement at advantage and profit.

"The prosperity of the counrty is measured and will be measured by the ability of its railways and waterways to transport its increasing commerce. With a country of such vast extent and limitless resources, with all the means of production developed to a wonderful state of efficiency, the continued advancement of this great people depends primarily upon such an increase of transportation facilities as will provide prompt and safe movement everywhere from producer to consumer; and *that* we shall not secure unless the men who are relied upon to manage those great highways of commerce have fitting opportunity and the capital which is required for their needful expansion is permitted to realize fairly liberal returns."

If the railroads are not allowed to charge a compensation for their services that will enable them to make a fair return on the investment with a reasonable surplus for betterments, improvements and the establishment of their credit, the task on their part of meeting the situation will be hopeless. In equity and justice they are entitled to this, and I believe if the question were understood in its different phases the good sense and fairness of the American people would be asserted in support of the railroads.

Not only have the railroads' expenses steadily increased of late years, but the purchasing power of the compensation received for their service has decreased. In other words, while the value of a given quantity of farm products will purchase 69 per cent more ton miles of transportation than in 1900, the purchasing power of the compensation received by the railroads for the transportation one mile of a given number of tons of freight in 1910 was 13 per cent less than in 1900.

With these adverse conditions confronting the railroads, it is absolutely necessary in order that they perform their functions to the public that they be allowed to advance at an early date their service charges. This is a matter of more vital concern to the welfare of the entire people than it is to the individual owners of the railroads.

If the railroads deteriorate in the service rendered, as they undoubtedly must if the conditions are not changed, it unmistakably means that commerce will be retarded; that industry will languish; that the many fruits of agriculture will wane; that the proud eminence we have attained in our many varied pursuits will crumble, and the unrest, discontent and dissatisfaction of an unemployed people may lead to the establishment of a new order of things with respect to the ownership and operation of the railroads of the country, with the attendant dangers to the perpetuity of our republican institutions. So the conclusion is irresistibly forced upon us that this railroad question is a Government problem, and one of very grave and serious concern, which should be satisfactorily settled, and the ominous dangers threatened averted thereby.

The President of the United States, before his inauguration into office, asserted that

"The measure of service rendered by business to the people will be the measure by which the merit of business shall be judged."

The railroads can accept this declaration and be satisfied to stand or fall by its concrete application.

I believe it will always be found that in any estimate made of the dignity and strength of our Nation, of the enlightenment and social comforts of our people, of the wealth and commercial greatness of our country, the significance of the railroads must stand forth—A MARKED CONSPICUOUS AND IMPORTANT FEATURE.

Action by New York Organization on Commerce Court.—The Transportation Committee of the New York Chamber of Commerce, has made a statement to the effect that the Commerce Court is a necessary part of our judicial system, not only for the reason that it expedites contested cases, but as best serving the interests of the shipping public in the securing of a uniformity of decisions applicable throughout the country in lieu of the conflicting decisions and delays experienced under former jurisdiction in the various district courts. It was, therefore:

Resolved, That the Transportation Committee recommend to the Executive Committee of The Merchants' Association of New York, that Bill H. R. 1921, proposing to abolish the Commerce Court, be opposed: and, further,

Resolved, That suitable representations be made to the President of the United States favorable to the continuation of the Commerce Court as in the interest of the great shipping public.

This recommendation was approved by the Board of Directors.

Are the Railways Fairly Treated?

By WILLIAM Z. RIPLEY,
PROFESSOR OF ECONOMICS, HARVARD UNIVERSITY.

THE most striking feature of the railroad problem in 1913 is the contrast with conditions ten years earlier. Instead of unexampled prosperity, a period of great financial depression in transportation business has supervened. In place of practical domination in the economic life of the country, the carriers now seem to be more or less at the mercy of circumstances. Organized labor under threat of general strikes has forced substantial concessions both in wages and conditions. The carriers have acquiesced manfully in the mandate of the people that they shall be subject to public control. But they find themselves now, by the pressure of increasing costs of operation and of even greater demands from the public for more and better service, practically compelled to throw themselves upon the mercy of the Interstate Commerce Commission for relief. This relief is demanded, not alone in the interest of investors, but in order that much-needed improvements and extensions commensurate with the development of the country may be made. It is a self-evident proposition that unless the railroads are prosperous and protected in the exercise of their property rights, a healthy growth of transportation facilities cannot be had. Adequate service and the convenience of the public require that the present plight of the railways should receive the most earnest consideration.

Railway net income which culminated in 1910, has now declined from that level by about one eighth, despite a considerable increase in gross earnings. The latest evidence shows a halting and uncertain movement. This condition of affairs makes it practically impossible for the carriers to raise funds by the sale, even of bonds, except at high rates of interest. Further continuation of hand-to-mouth financing by issuance of short-term notes is fraught with danger. A menace to continued prosperity also is the successful pressure of the railroad brotherhoods for substantial increases of wages.

Under ordinary circumstances relief might be had from three directions. greater economy and efficiency; a substantial growth of traffic; or an increase of rates.

Economy and greater efficiency of operations, as a remedy for deficiency of revenue, played a large part in the rate advance cases of 1910. But it is clear that railroads, as a field for the introduction of scientific management methods, are considerably handicapped. Rigid rules of the railway brotherhoods are difficult to overcome. The wide geographical extension of operations renders detailed superintendence impossible. And the steadily increasing demands of the public for more and better service, regardless of cost, hinder the introduction of many plans for more scientific operation. On the whole, American railroads are operated at the high level of efficiency. Certain economies ought, nevertheless, to be affected. Among these should be a careful revision of purchasing department methods. Laxity and private profit ought to be rigorously excluded. Every advantage should be taken of the open market regardless of financial affiliation with the large industrial combinations. This point was especially referred to in the Eastern rate advance cases of 1910. Contracts with private car and express companies ought to be reduced to the lowest possible figures, so that all suspicion of favoritism should likewise be eliminated. With houses thus set in order the roads should be able to present a strong case for efficiency. They need fear comparison with no other country in the world.

Increase in tonnage, as a remedy for the existing distress, promises less relief than might have been expected five years ago. This follows naturally from the rise of operating costs already mentioned. But it is also established by the clear demonstration that after a certain point of traffic congestion has been reached, immediate, general and extraordinary outlay of capital is necessary in order to handle further increments of tonnage. Unless earnings, therefore, are sufficiently ample to permit of large annual improvements out of income, the demand for new capital seems bound to outrun the earning power.

It is apparent from the foregoing statements that relief can be afforded for the present crisis in a large way only by the sanction by the Government under the new powers of control exercised since 1906-10, of a general increase of rates chargeable for service. Experience of the last ten years emphasizes the point that such relief can scarcely be afforded piecemeal. The growing unity of interest of all carriers arises not only out of the close inter-relation of rates all over the country under the stress of commercial competition but also because of the practical standardization of the largest item in railway expenses, namely, the outgo for wages under pressure from the railroad brotherhoods. It would appear therefore that in place of attempts, road by road, to raise rates on individual commodities, what is needed is the formulation of a carefully prepared plan of more general revision.

A substantial increase of revenue by means of higher freight rates seems, then, inevitable. But the failure to secure the approval of the Interstate Commerce Commission in 1910, instead of being discouraging, should point out the way for the future. The Commission at that time promised to consider similar propositions in future without prejudice. They have, as a matter of fact, since 1910 permitted more raises of rates than they have denied, as shown by the following statement.

Proposed advances approved	66
Proposed advances approved in part	18
Proposed advances disapproved	60
Proposed advances voluntarily withdrawn	18

And then, in addition to these cases of suspension, thousands of increases have been allowed to take place without interference. For New England, thus far, not a single proposed increase has been permanently prevented, and an aggregate increase of charges of over $3,000,000 has actually occurred since 1910. The policy of the carriers should be to cease crying "Wolf," there-

Digitized by Google

by arousing distrust among investors; and to go confidently forward and prepare a strong and logically defensible schedule of advances to present to the proper authorities.

In the upward revision of rates the representatives of shippers should be consulted, as was recently done, in the increase of transcontinental rates, just sanctioned by the Commission. Many favors to the trusts which now exist through unduly low rates on such commodities as sugar, copper, cattle and beef and steel products should first of all be corrected. Despite the great rise in prices, rates on many of these trust-made commodities are no higher than they were in 1900. All suspicion that interlocking directorates have perpetuated these unreasonably low freight rates should be met. The relation between rates to large cities and industrial centres, as compared with local charges, needs attention, also. If the railways come with clean hands, well-ordered houses and a proper scheme of increases, the Interstate Commerce Commission can scarcely fail to recognize the justice of their demands.

Positive remedial legislation in the interest of railroads, as distinct from mere administrative sanction of rate increases, is distinctly demanded also by the situation respecting arbitration of wage disputes. The Erdman Act of 1898 is notoriously unfair to the carriers, leading, as it always does, to a compromise decision rather than to a settlement upon the merits of the case. This results from the fact that the entire responsibility for the final decision rests upon the third member of the arbitration board representing the public as distinct from the other two representatives of the carriers and their organized employes respectively. The law should be amended to provide for a commission in part composed of permanent Government experts—the remainder of its membership being made up of members chosen to represent directly the three parties in interest, the railroads ,the employes and the public. But the public representation should at all times outnumber that of the carriers and the operatives. Only thus, by a massing of responsibility in strictly impartial hands, may decisions be expected on the real merits of the case. It is probable, also, that the time has come, if politically possible, for a prohibition of strikes or lockouts on railways pending the report of the official tribunal. As for compulsion in enforcing the award, that may probably be left to the force of public opinion. The experience of Canada and other countries, however, clearly points to the inadvisability of entrusting all these matters of wage determination to tribunals, judicially constituted; that is to say, composed of judges bound by the rigors and formalities of legal procedure.

The railways deserve protection, finally, against further continuance of special inexpert legislation by the several states. With powerful railroad commissions, now established by law in most of the commonwealths, the legislatures ought to refer all such matters of regulation and service to such boards. The enactment of drastic and inflexible full-crew and hours of service laws may work great hardship in the future. All such matters should be referred to administrative boards, which may apply the law with due regard to public needs and the circumstances of the case.

The Daily Freight Performance of a Mile of Railway

By LOGAN G. McPHERSON,
DIRECTOR, BUREAU OF RAILWAY ECONOMICS.

THE freight trains of the United States move for the 90,000,000 inhabitants of the country very nearly everything that they eat and wear, the materials with which their buildings are constructed, the articles with which they are furnished and the various things of use. As there are over 2,000,000 freight cars in the United States it follows that, roughly speaking, one freight car is required to supply the needs of every 45 persons.

As there are 90,000,000 persons in the United States and 240,000 miles of railway line it follows that every mile of railway meets the needs of about 375 persons. As the capitalization of the railways of the United States averages about $60,000 a mile, it appears that the railway companies have made an investment of about $60,000 to meet the transportation needs of every 375 persons, which is equivalent to an investment of about $160 to meet the transportation needs of each man, woman and child in the United States. The net dividends paid in 1910 average about $1,220 a mile. As one mile serves 375 persons this is an average dividend of about $3.26 per person, which is a fraction less than one cent a day. These are averages obtained from round numbers, but averages are useful in "giving an idea."

The 2,000,000 and upwards of freight cars that are in the service of the railways of the United States carry a great variety of commodities. Between a ton of coal at the one end of the list and a ton of candy or perhaps of feathers at the other end is a vast range of things of widely differing degrees of serviceability and there is wide difference in the periods required for their consumption.

As an aggregate can best be comprehended through a study of its parts an idea can perhaps best be gained of what all of the railways of the United States do in a year by ascertaining what the simplest linear unit of a railway, which is one mile, does in the simplest unit of time, which is one day. To ascertain exactly what traffic is actually moved over a mile of railway in one day two railway companies were respectively asked to compile this information for their respective lines. One is an Eastern trunk line having a greater density of traffic than any other in the United States, and its traffic is typical of the manufacturing region which it serves. The other is a railway of the Middle West whose traffic is naturally typical of the grain raising, meat-producing, cotton-grownig, lumber-producing region which it serves. Officers of these railways have furnished the information here set forth.

Over one mile of the Eastern railway pass in

Digitized by Google

one day 794 freight cars, 105 passenger cars, and 46 locomotives. Over one mile of the Western road pass every day 198 freight cars, 27 passenger cars and 12 locomotives.

The Eastern railway hauls on the average over each mile each day enough cement, brick, and lime to supply 1,976 persons for one year; enough coal and coke to supply 1,594 persons one year; enough cotton to supply 794 persons one year; dressed meat to supply 318 persons one year; fruit and vegetables to supply 1,176 persons one year; iron for 11,146 persons; ores for 329 persons; poultry, game and fish for 650 persons; stone and sand for 1,308 persons; sugar for 825 persons; wines, liquors and beers for 381 persons; wool for 1,270 persons for one year. The freight per mile per day thus expressed aggregates 10,552 tons, leaving 2,942 tons, or nearly 6,000,000 pounds, of other commodities not so classified that the average consumption can be ascertained.

The Western railway hauls on the average over each mile each day enough cement, brick and lime to supply 302 persons for one year; enough coal and coke to supply 56 persons for one year; enough cotton to supply 1,698 persons for one year; enough dressed meats and other packing house products to supply 1,045 persons for one year; enough flax and other seed for 17 persons for one year; enough flour for 455 persons; other mill products for 569 persons, petroleum and other oils for 633 persons; poultry, game and fish for seven persons; fruit and vegetables for 249 persons, grain for 146 persons; hay and straw for 14 persons; iron for 110 persons; rice for 1,122 persons; salt for 1,896 persons; stone and sand for 16 persons; sugar and molasses for 1,089 persons; wines, liquors and beers for 297 persons. The 1,106 tons of lumber which comprise about two fifths of the daily traffic over one mile of this railway are enough to build 44 two-story, eight-room wooden houses of medium size. The lumber hauled by this road in the course of a year is sufficient in quantity to build over 45,000 such houses.

In order to conduct this daily transportation which consists on the Eastern railway of 1,170 passengers and 13,494 tons of freight per mile, to say nothing of the mail and express, there is required 90,600 pounds of coal as fuel for the locomotives.

The similar performance of the Western road calls for the services of various classes of employes, officers, station men, trainmen, trackmen and shopmen to an extent equivalent to the total service of 10 men for one day. For the 250 passengers and 2,653 tons of freight and the mail and express which it hauls over one mile in one day it receives $30.82, of which $19.10 is paid out for expenses of operation, $1.39 as taxes, $5.08 as interest and $2.82 for dividends, the remainder going for miscellaneous items and services.

The average performance for each mile for each day multiplied by 365 days gives the total performances for each mile for the year. This multiplied by 240,000, the aggregate number of miles, gives the total performance of all the railways of the United States for the entire year. It will be perceived that a difference of one cent a mile a day in the earnings or the expenses makes a difference of $876,000 a year; a difference of 10 cents a mile a day a difference of $8,760,000 a year; a difference of $1 a mile a day amounts to $87,600,000 for the year, and this is very nearly one third of the net dividends paid by all the railways of the United States for the entire fiscal year 1910.

The English Railophone

THERE are now well understood principles of electrical intercommunication by means of metallic cable circuits between fixed stations, and by means of etheral waves between moving objects such as ships at sea. Both of these systems, owing to the highly efficient instruments invented during the last thirty years have reached that perfection necessary for a successful and practical application. Neither of these principles, nor the existing instruments, have been applied with any degree of success for the estabilshment of reliable inter-communication under modern conditions between railway trains in motion, or trains and stations, for which purpose an arbitrary code of mechanical signals is still employed, augmented here and there by standard apparatus adopted from recent developments in other branches of electrical engineering.

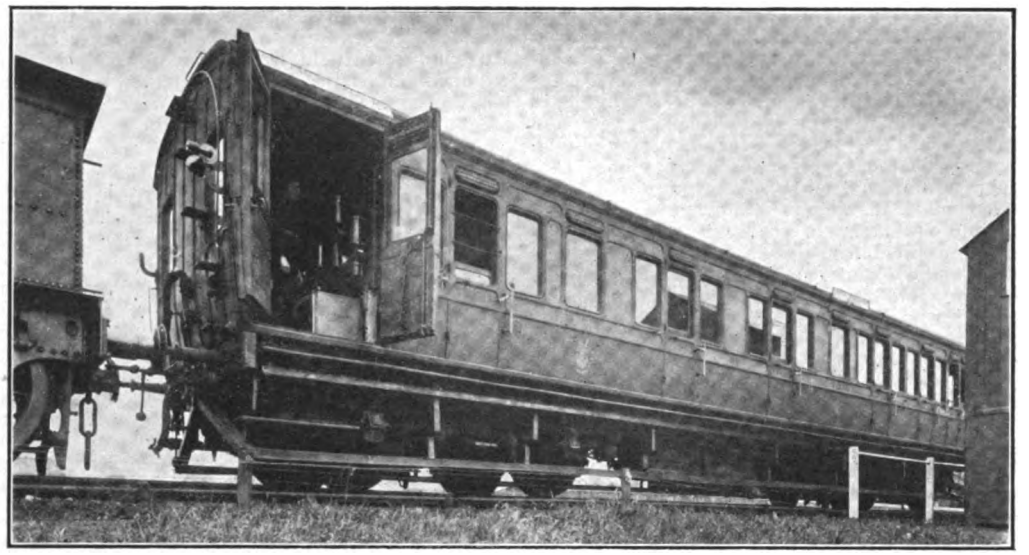
Recently, however, Mr. H. Von Kramer, an electrical engineer of Witton, near Birmingham, England, has succeeded in establishing a telephonic link between an express train and a signaling box at Three Bridge Station on the London, Brighton and South Coast Railway. In his experimental installation he has employed the principle of electric induction between apparatus carried on board the train and a copper cable embedded in the earth several feet away, parallel with, but outside of, the permanent way.

The apparatus, which is known as a "railophone," is used as a train telephone. The equipment for the establishment of telephonic communication between a moving train and a station, as shown in the illustration, consists of a telephone transmitter and a pair of receivers, in the form of an operator's headgear, fixed in a soundproof telephone box, carried in the guard's van of the train. These instruments are electrically connected with two large insulated copper coils mounted in a wooden casing, called "the railophone frames" suspended by iron brackets from the coach. The "upper frame" is suitably wound for sending, and the "lower frame" for receiving a telephonic message.

The telephonic currents produced by the voice of the operator create a magnetic field which waxes and wanes in unison with the alternations of the voice. This field, emanating from the railophone "upper frame" induces an electric current of corresponding periodic pulsations in the metallic conductor buried in the earth alongside the railway track. This "ground wire" is connected to similar telephone instruments fixed at stations, and if desired may be linked up with the general telephone and telegraph system of the country. Telephonic conversation is carried on through the railophone just as through an ordinary telephone, no change-over switch from "sending" to "receiving" being required.

There is no mechanical contact between the

Digitized by Google



LOCATION OF RAILOPHONE IN ENGLISH PASSENGER COACH.

"ground wire" and the moving train. The connection is "wireless" or accurately described as "wireless inductive," the telephonic current being transmitted through the space which exists between the ground wire and the lower frame on the passing train. Inversely, telephonic currents, inductively imposed upon the ground wire by the upper train frame, are picked up at the stations by telephonic receivers which are pressed by a steel band against the ears of the operator.

In the original railophone system there were no means of "capping up" and as is still the case with radio telegraphy on board ship, so that the railophone operators had to be in constant attendance. This shortcoming, however, has recently been rectified by the introduction of a highly sensitive detector—the joint invention of Mr. H. von Kramer and Dr. Gisbert Kapp, professor of electrical engineering in the University of Birmingham. By the aid of the detector, which corresponds to a "coherer" in wireless—the exceedingly feeble electrical impulses received on the train form a vibrating charge sent into the ground wire is picked up and "relayed" into suffiicently strong currents to ring a calling bell, or sound a powerful hooter.

The ringing up of a station from a moving train is effected by the same means. The train telephone enables guard and signalman to communicate with each other—whether the train is in motion or at a standstill—for the purpose of traffic regulation, in case of accidents or during fogs or snow storms, and messages to and from passengers can be "railophoned" with ease and accuracy. In case anything unforeseen happens, on, or to a train, immediate communication with the nearest station is assured. Many other applications have been suggested, as for example, the railophone is also used as a train telegraph. With slight modifications to the system as applied for telephony, and by the addition of a few telegraphic instruments, it can transmit telegraphic signals by means of a Morse key. On the Stratford upon-Avon and Midland Junction Railway either mode of communication, telephonic or telegraphic is employed without necessitating the use of change-over switches. Particular attention is drawn to the fact that with the railophone system of combined telephony and telegraphy, the sending operator can be instantaneously interrupted, an important feature in railway work in cases of emergency.

Again, the railophone may be used for railway signaling, the "Kramer-Kapp" resonating relay, called the "K-K" detector being principally used for the detection of the railophonic impulses sent out from signal boxes or trains and making it an important factor in the solution of the problem of automatic train signaling. By its use its inventors claim that it is now possible to cause the ringing of bells, the sounding of steam whistles or motor hooters, the bringing into play of mechanical movements capable of opening or closing lever controlling steam valves of locomotives, signal levers interlocking gear, the operation of vacuum brakes for the ignition of indicating electric lamps—all for the purpose of direct or indirect control of trains.

This detector has even been successfully adapted for automatically stopping a train without the intervention of the guard or driver by means of the von Kramer system for railophone signaling which provides for the automatic blocking of a section against a following train and the liberation of the section after the first train had passed out of the danger zone. It is also applicable to double automatic railway signaling and it is now possible to not only signal from a train when it reaches the entrance of a section to the signalman, but also to signal from the signal box to the train irrespective of its position in the section or whether it is proceeding at full speed or standing still anywhere on the track.

The electrical equipment at the station consists of a signal box fitted with a "K-K" detector, several sending, receiving and recording apparatus, and the necessary underground electric lines. These circuits are divided into three distinct groups, viz.:—the main section, (of any suitable length from one mile up to ten miles and more if desired) the restoring section, and the clearing

Digitized by Google

section, the latter two sections being each approximately 100 yards long.

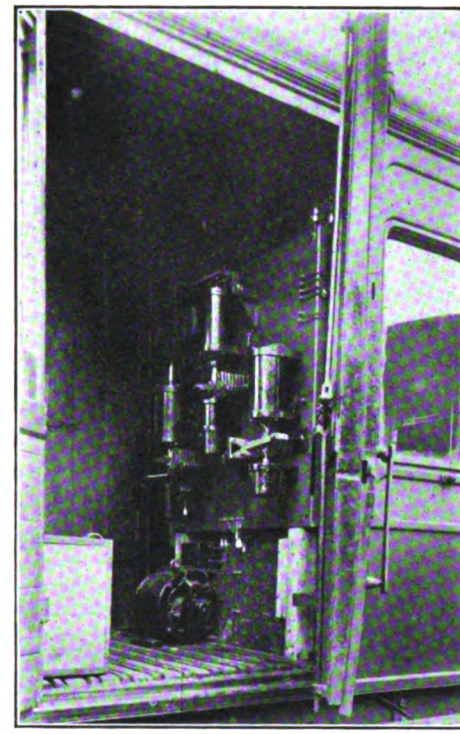
On the trains the electric equipment consists of two "railophone frames" fixed to an ordinary coach, and a series of apparatus for receiving, sending and recording signals. By means of the apparatus provided on the train and in the signal box a certain cycle of operation is carried out. At first when a train enters the main section a red lamp is lit in the signal box. The lamp is placed over that particular signal which controls the semaphore signal protecting this section. Then the red lamp continues alight as long as the train occupies the main section and until it leaves the restoring section.

Simultaneously with the light of the red lamp, an audible signal in the form of a bell or buzzer, sounds in the signal box. These visual and audible signals indicate to the signalman the entry of the train into the main secton, and warn him of the necessity of protecting it by moving the signal lever into the "danger" position. Then, unless the signalman responds to these signals within a fixed period of approximately ten seconds, the signal lever is automatically pulled into the "danger" position. This automatic operation is simultaneously registered by a recording instrument. Whether the signal lever has been pulled into the "danger" position by the signalman or by automatic means, it remains electrically locked in that position until the train has left the section. This renders it impossible to again open the section to admit a second train while it is occupied by the first train.

In case the signal lever is automatically replaced, the train is allowed to travel the section, but apparatus are brought into play causing a powerful alarm gong to sound outside the signal box, and the incident to be automatically registered on a recording instrument, which indicates the time of the occurrence. By these means a close control is kept over the signalman's actions. Should the signalman operate the signal lever on being warned, nothing further transpires in the signal box until the train enters the clearing section when the red lamp is automatically extinguished and a green lamp lit, which is, in turn, extinguished when the train finally leaves the clearing section, the signal lever being simultaneously unlocked.

After the train has sent out the signals indicating its entry into the main secaion, it is, by means of a time limit device, enabled to receive signals or instructions affecting its movements while in the main section. In this receiving condition, the train can at any moment receive either telephonic or telegraphic instructions, and can be brought to a standstill by the signalman at will, or the guard on the train car, if desired, place himself into communication with the signal box. Under normal conditions a second train, unless it overruns the danger signal at the entrance of the main section, can not enter the main secion if same is still occupied by the first train. In the event, however, of the second train ignoring the danger signal, and entering the section, both trains are automatically brought to a standstill. This incident is also recorded on the train and in the signal box.

If a second train enter the section in the ooposite direction to the first train, both are pulled up, thus avoiding all possibility of "head on" collisions. The train on entering the restoring section automatically receives, while passing through



A Railophone Installation.

this section, an impulse which through the "K-K" detector, brings into operation apparatus which first advises the signalman of the trains' entry into the clearing section by automatically lighting a green lamp in the signal box and then, on entering the subsequent main section, indicates its approach to the succeeding signal box, reproducing once more the cycle of signals as described. As soon as the train has left the clearing section the instruments in the signal box are restored to their normal condition, ready to deal with further incoming trains. If the train be prevented from entering the succeeding main section, the green lamp continues to glow, and, in addition, the alarm gong is sounded outside the signal box, the incident being again recorded. As the main section is simultaneously under current, it provides a double safeguard against the entry of a second train into the section. On receiving permission to enter the succeeding main section, the train may proceed. If the driver should proceed before he receives such permission, the train is automatically pulled up on entering the succeeding section.

These railophone signals are "uni-directional" and cannot stray to other trains as was the case when attempts were made to use the radio-telegraphic principle. There are no sliding brushes required, no mechanical or electrical contact bars or switches under the train, no bonded rail joints or any obstructions to the permanent way, or is the system influenced by atmospheric disturbances or climatic conditions.

It is claimed that the upkeep of the ground wire circuits, owing to their being embedded in the earth, is practically nil. The ground wire serves a large number of trains per day, and the initial cost for same per train mile is therefore a

Digitized by Google

very small item. The five principal devices used in the signaling system include the stationary underground metallic circuit, which is non-inductive to outside influences, and the movable circuit consisting of two large frames fixed to the coaches of a train, these frames serving for telephonic, telegraphic and signaling communication. There is also the turnable detector acting as a sensitive relay under railway conditions, and the alternating current apparatus and instruments for sending signals. Finally, there are the automatic solenoids operating the alarm signals and controlling gear.

It is said that the adoption of a railophone automatic signaling plant does not entail any modification of the existing rules and regulations. With the exception of the audible and visible signal in the signal box there are, under ordinary working conditions, no additional apparatus to be attended to by the signalman. As the engine does not carry any railophone apparatus whatever, the driver is not diverted from his usual duties.

Finally, it is claimed that the railophone system does not encourage slackness on the part of the driver and signalman through their placing blind reliance on the automatic apparatus to perform their duties. On the contrary, it increases their alertness as any inattention or carelessness on their part would be carefully and automatically recorded and could be consequently used as evidence against them. By thus constantly checking every irregularity, it is considered that the large number of daily occurring minor accidents, which are frequently more serious, can be greatly reduced if not wholly avoided. While all mistakes are duly recorded, the system provides substantial means for automatically retrieving such errors and so prevents collisions.

Modern Transportation

IT is a recreation to the busy railroad official to occasionally turn his thoughts from the problems immediately at hand, to the developments in those other branches of transportation, not associated with railway operations.

The improvements in steamship construction which have resulted from the Titanic disaster of a year ago, are of more than usual interest because through this disaster the railway service suffered irreparable loss in the deaths of two of its foremost railroad officials. The improvements referred to have been developed in the hull construction of the great ocean liners, as illustrated in the accompanying photographs. Hulls are now built double with transverse bulk heads extending between skins to the upper deck. The new Hamburg-Amercan liner, Imperator, the largest vessel afloat, was designed and built on this principle, while the White Star liner, Olympic, originally built with a single hull, has been reconstructed along these lines, at a cost of $1,250,000. These improvements add immeasurably to the safety of ocean travel.

Turning from the sea to the air, the accompanying photograph of one of the latest German Zeppelin air crafts, is of interest. While disaster after disaster has accompanied the construction and operation of these monster vessels,

EDWARD CHAMBERS.

RALPH C. CAPLES.

olson, deceased. Mr. Chambers was born February 16, 1859, at Waukegan, Ill., and was educated in the public schools. His entire railway service has been with the Atchison, Topeka and Santa Fe system, with which road he began work in November, 1878, as a freight handler on the platform at Pueblo, Colo. He remained at that place until 1885, successively as check clerk, foreman of transfer platform, and cashier. He was then transferred to San Diego, Cal., as local agent, and in 1887 became local agent at Los Angeles, Cal. Seven years later he was promoted to assistant general freight agent at that point; from 1894 to 1896 he was general freight agent, with headquarters at the same place, and then until March, 1905, he was freight traffic manager of the Coast Lines, with office at San Francisco, Cal. He relinquished the duties of the latter position June 1 to become vice-president of the Santa Fe system, in charge of traffic, as above noted.

Ralph C. Caples.

RALPH C. CAPLES, until recently general agent of the traffic department of the New York Central Lines, with headquarters at New York, has been appointed general traffic manager of the Western Maryland, with headquarters at Baltimore, Md. He was born on December 23, 1872, at Fostoria, Ohio, and was educated at Oberlin College, Oberlin, Ohio, also at Northwestern University, Evanston, Ill., and in 1896 entered Princeton University, Princeton, N. J. Previous to this, at the age of 18, he became yard clerk on the Lake Erie and Western, at Fostoria; the following year was advertising agent of the New York, Chicago and St. Louis, and in 1892 he became traveling passenger agent for the Mobile and Ohio. After leaving college he was passenger agent of the Delaware, Lackawanna and Western at New York, and then for two years was general passenger agent of the Detroit and Lima Northern, now a part of the Detroit, Toledo and Ironton. During 1900 and 1901 he was general manager at Tampa, Fla., of the Florida West Coast Transportation Company, operating a line of steamers. In 1907 he entered the service of the New York Central and Hudson River, and in May of that year was made special representative of that road. In February, 1909, he was promoted to general agent of the traffic department, covering all New York Central Lines both east and west of Buffalo, N. Y., and left that position on June 1, to become general traffic manager of the Western Maryland as noted above.

H. W. Stanley.

H. W. STANLEY, who was recently appointed general manager of the Seaboard Air Line Railway, with office at Portsmouth, Va., was born February 13, 1874, at Petersburg, Va. He was educated at Lynchburg High School and began railway work as telegraph operator on the Norfolk and Western Railway. Later he served in several capacities on

H. W. STANLEY.

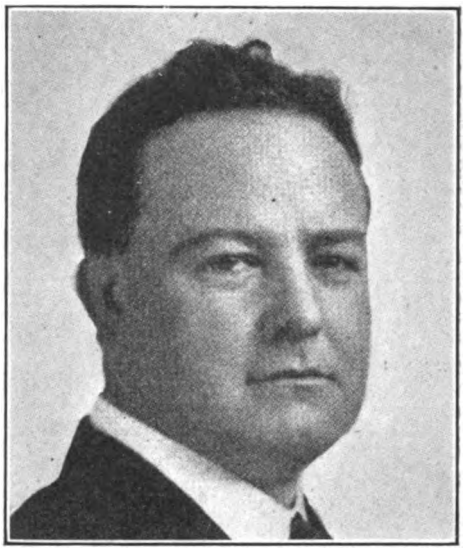
that road until December, 1895, when he became chief clerk to the superintendent of the Southern Railway at Knoxville, Tenn. In May, 1897, he accepted service with the Seaboard Air Line Railway as secretary to the general superintendent and has been consecutively chief clerk to the general superintendent and general manager, trainmaster, superintendent, superintendent of transportation, assistant general superintendent, general superintendent transportation and assistant general manager, from which latter position he is now promoted.

George A. Blair.

GEORGE A. BLAIR, who has been appointed assistant freight traffic manager of the Chicago, Milwaukee and St. Paul Railway, began his railroad career with the old Ohio and Mississippi Railroad at Cincinnati, Ohio, as bill clerk in the local freight office. From that road he went to the Atchison, Topeka and Santa Fe Railway as traveling freight agent at Cincinnati and of the Chicago, Milwaukee and St. Paul Railway in the same city. Mr. Blair later became general agent of the latter road at Pitts-

GEORGE A. BLAIR.

burgh, Pa., and from that position was appointed general Eastern agent for the company at New York. He was made assistant general freight agent, and served until September 1, 1912, when he accepted appointment as general traffic manager of the Chicago and Alton Railroad. A general circular from the office of President Worthington says: "Mr. Geo. A. Blair, having resigned as general traffic manager of this company, effective May 1, to return to and accept promotion on the Chicago, Milwaukee and St. Paul Railway, until further notice Mr. C. A. King, freight traffic manager, will have charge of freight traffic, and Mr. Geo. J. Charlton, passenger traffic manager, will have charge of passenger traffic. It is with regret on the part of the Chicago and Alton Railroad Company that Mr Blair leaves its service, where he has proven himself to be so thoroughly efficient, to accept this well merited recognition and advancement."



W. E. Prendergast.

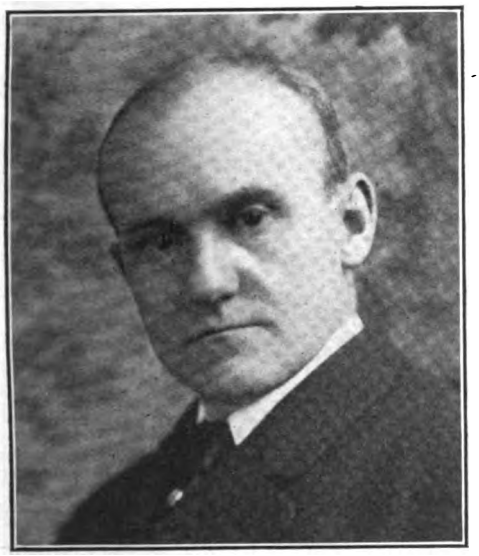
W. E. PRENDERGAST, who was recently appointed general freight agent of the Chicago, Milwaukee and St. Paul Railway, effective May 1, started in the railroad business in 1884 with the Chicago, St. Louis and Pittsburg Railroad, afterwards the Pittsburg, Cincinnati, Chicago and St. Louis Railroad, under Mr. D. T. McCabe, now vice-president of the Pennsylvania Lines West of Pittsburg. He remained with that company for ten years and then for several years was secretary to Mr. Marcus Daly, owner of the Anaconda Copper Company. Mr. Prendergast entered the service of the Chicago, Milwaukee and St. Paul Railway in 1897, as chief clerk to the assistant general freight agent, in 1902 became chief clerk to the general freight agent and in 1905 was made chief clerk of the general freight department. He was appointed assistant general freight agent January 1, 1907, and served in that office until his recent promotion.

EDWARD BRIGGS.

Digitized by Google

Edward Briggs.

EDWARD BRIGGS, who on May first, was appointed assistant general freight agent of the Wheeling and Lake Erie Railroad, began his railway career as bill clerk in the local freight office at Cleveland of the Connoton Valley Railway in 1882. He was promoted to local ticket agent of same company which position he held until 1884 when he was appointed local freight agent. In 1888, he became chief clerk to the general freight and passenger agent of the Cleveland, Canton and Southern Railway, and in 1899, he accepted the position of chief clerk to the traffic manager of the Republican Iron and Steel Company at Chicago. From there in 1900, he went to the Wheeling and Lake Erie at Cleveland, as chief clerk to the general traffic manager, and when the Wheeling and Lake Erie, Wabash, Pittsburgh Terminal Railway and Wabash Railroad interests were merged at Pittsburgh in 1906, he was appointed chief clerk to the general freight department at that city, and in 1907 was made commercial agent of the three roads. In 1908, he accepted the position of general agent of the Wheeling and Lake Erie at Cleveland, which position he held until his recent appointment as assistant general freight agent.

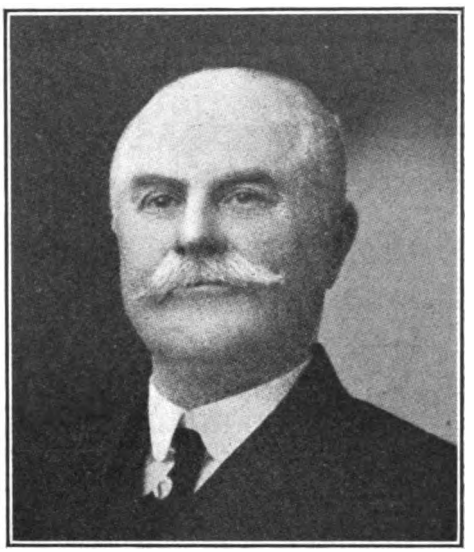


Harry T. Wilkins.

HARRY T. WILKINS, formerly chief clerk in the office of the Chief Mechanical Engineer of the Pennsylvania Railroad, has just been appointed special agent of the Traffic Department with office in Broad Street Station. Mr. Wilkins will have charge of the preparation, installation and display of the Pennsylvania Railroad System's exhibit at the Panama-Pacific International Exposition to be held in San Francisco in 1915.

Mr. Wilkins has been in the service of the Pennsylvania Railroad Company since 1888, when he became a stenographer in the Passenger Department. He was one of the first stenographers on the "Pennsylvania Limited," and in February, 1891, he was transferred to Altoona in the office of the General Superintendent of Motive Power. He came to Philadelphia in March, 1893, as chief clerk in the office of the Chief of Motive Power.

The Pennsylvania Railroad has taken part in practically all important expositions in the United States and abroad since the World's Fair in 1893, and Mr. Wilkins has been closely identified with the preparation of the company's exhibits.



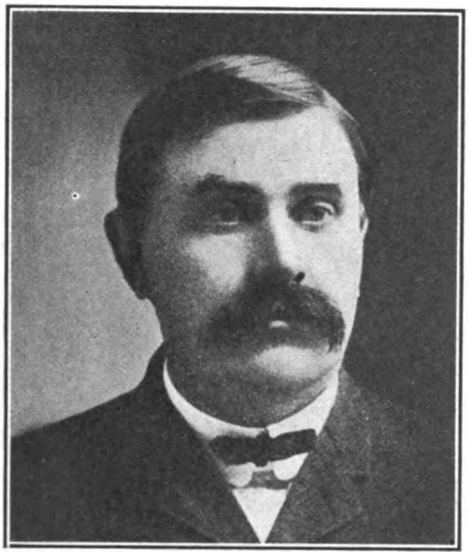
F. M. Bisbee.

F. M. BISBEE has been appointed chief engineer of the Santa Fe's Western lines, with office in Amarillo, Tex. He was born on September 27, 1885, in Brunswick, Me. After graduating from the University of Maine he entered railway service in 1878 with the Santa Fe as a rodman, since which he has been consecutively transitman on the Atchison, Topeka and Santa Fe; superintendent of construction for the Mexican Central Railway; superintendent of tracklaying on the Santa Fe; superintendent of track, bridges and buildings on the Frisco System; from March, 1901, to July, 1902, general manager and chief engineer of the Tennessee Central Railway; August, 1902, to July, 1903, general manager, Los Angeles Land and Water Company; July, 1903, to July, 1904, engineer for B. Lantry and Sons, Fort Madison, Ia.; July, 1904, to April 1, 1913, engineer, Western lines, with headquarters in La Junta, Colo.

Robert A. Rutledge.

ROBERT A. RUTLEDGE has been appointed chief engineer of the Santa Fe's Eastern lines, with office in Topeka, Kan. He was born in Mercer county, Pennsylvania, on December 13, 1863. His family later moved to Kansas and Mr. Rutledge was educated in the public schools of that state and later attended the University of Kansas, being graduated in 1891. From August 1, 1892, to May 14, 1893, Mr. Rutledge was employed as a rodman on the G. C. and S. F. Ry. He moved to Colorado and was city engineer and city clerk of Florence, Colo., and county surveyor of Fremont county from January, 1894, to January, 1896. From then

Digitized by Google

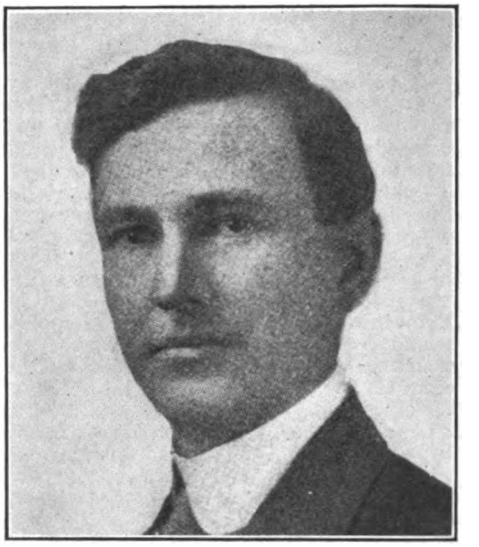


ROBERT A. RUTLEDGE.

until June, 1897, he served as deputy United States mineral surveyor in Cripple Creek, Colo. He returned to the G. C. and S. F. on June 16, 1897, serving as instrumentman in Temple until February, 1899. From that date until November, 1900, he was assistant engineer in charge of construction of yards at Belleville, Tex., and of reconstruction of the main track from Brenham to Sealey, Tex. From November, 1900, to September, 1904, he was assistant engineer, with offices in Cleburne and Beaumont. Two months as roadmaster were followed by an appointment to the position of resident engineer of the Beaumont and Southern divisions, with headquarters in Beaumont. This position he occupied until 1909, when he was transferred to Cleburne as engineer of the Northern division. One year later he went to Galveston to accept the position of engineer of the Gulf Lines, which he held until his recent promotion.

F. L. Thompson.

F. L. THOMPSON, who was recently appointed engineer of construction of the Illinois Central, was graduated from the University of Illinois in civil engineering, with the degree of B. S., in 1896. He entered the service of the Illinois Central June 18 of that year as chairman on the reconstruction and lowering of tracks on the lake front in Chicago, and later was made rodman and inspector on the concrete work. From February of the following year to February, 1898, he was rodman at Vicksburg, Miss., on the work of removing a 700-foot tunnel and making it an open cut and had charge of a concrete arch and building of a large freight house. He was then until January, 1900, rodman and assistant engineer on surveys and on grade reduction work, Fulton to Memphis, and from the latter date to August, 1901, assistant engineer in charge of grade reduction and double track work, Wickliffe to Fulton, Ky. He was subsequently for six months in charge of double track and grade reduction work from Irvington to Carbondale, Ill., and from February, 1902, to



F. L. THOMPSON.

February, 1903, was assistant engineer in the chief engineer's office at Chicago. The following eight months he was acting roadmaster of the Chicago division, being transferred to the Louisville division as roadmaster in October, 1903, and remaining in that capacity until January, 1907, when he was made assistant engineer of bridges. On July 1, 1910, he was promoted to engineer of bridges and buildings, which position he held until his recent appointment as engineer of construction, as above noted.

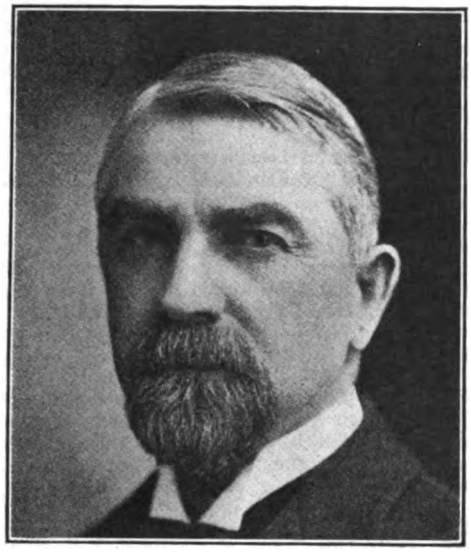
Ira L. Burlingame.

IRA L. BURLINGAME, who on April 14, was made general manager of the Terminal Railroad Association of St. Louis, as has already been announced, was born September 6, 1862, at Franklinville, N. Y., and was educated at

Digitized by Google

Ten Broeck Academy. He entered railway service in 1879 as a telegraph operator for the Ohio and Mississippi, and from 1883 to 1895 was a train despatcher on that road. He was then for nine years trainmaster of the Baltimore and Ohio Southwestern, and in December, 1903, left that road to go with the Terminal Railroad Association of St. Louis as assistant superintendent. He was superintendent of that Association from March, 1904, to November, 1905, and on the latter date became general superintendent, from which position he is now promoted to that of general manager, as above noted. Mr. Burlingame assumes part of the duties heretofore performed by President and General Manager W. S. McChesney, Jr., who relinquished the duties of general manager, and recommended the election of Mr. Burlingame to that position.

Obituary

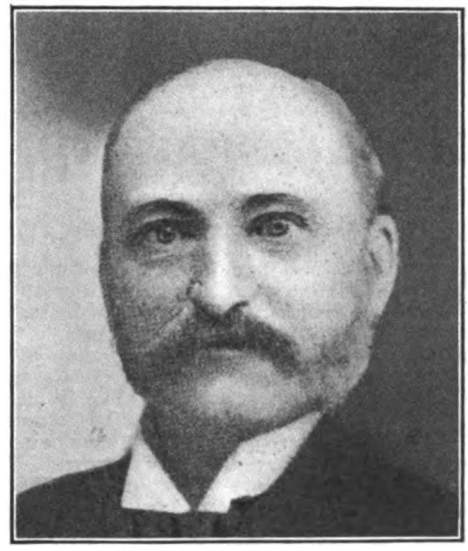


Horace G. Burt.

HORACE GREELEY BURT, for the past two years chief engineer of the Chicago Association of Commerce Committee on Smoke Abatement and Electrification of Railway Terminals, and formerly president of the Union Pacific, died at the Oak Park Hospital, Oak Park, Ill., May 19. Mr. Burt was born in January, 1849. He was graduated from the high school at Terre Haute, Ind., in 1867, and from the University of Michigan in 1873. He began railway work in March, 1868, as rodman on surveys and construction of the St. Louis, Vandalia and Terre Haute, and from December, 1869, to December, 1870, was engaged on location and construction of the Joy railroads in Kansas. He then attended the University of Michigan until February, 1873, when he went to the Milwaukee and Northern for one month. He was next employed in the engineering department of the Chicago and North Western from March, 1873, to the summer of 1881, at which time he was made superintendent of the Northern Iowa division. In December, 1883, he was transferred to the superintendency of the Iowa division, and in October, 1887, he was promoted to chief engineer. He became general manager of the Fremont, Elkhorn and Missouri Valley in November the following year, leaving in July, 1896, to go to the Chicago, St. Paul, Minneapolis and Omaha as general manager. Three months later Mr. Burt was elected third vice-president of the North Western in charge of traffic, retaining that position until January 1, 1898, whe he resigned to become president of the Union Pacific. After leaving the Union Pacific he took a trip around the world for his own recreation and instruction, leaving during the winter of 1904 and returning to Chicago in 1905. After returning from abroad he engaged in business as consulting engineer at Chicago, returning to active railway service again in January, 1909, when he was appointed receiver for the Chicago Great Western. In September of that year he once more took up private practice as consulting engineer at Chicago.

William Edward Davis.

WILLIAM EDWARD DAVIS, passenger traffic manager of the Grand Trunk and the Grand Trunk Pacific, with headquarters at Montreal, Que., died on May 15, at Vaudreuil, near Montreal. He was born on August 2, 1850, at Wilson, Niagara county, N. Y., and began railroad work in 1868, as a clerk on the Hannibal and St. Joseph, now a part of the Chicago, Burlington and Quincy. From 1873 to 1877, he was with the Kansas City, Fort Scott and Gulf, now a part of the Frisco system, and in August, 1877, he entered the service of what is now a part of the Grand Trunk system, then known as the Chicago and Lake Huron.



WILLIAM EDWARD DAVIS.

Digitized by Google

This company afterwards passed to the control of the Grand Trunk and is now what is officially known as the Grand Trunk Western. He was subsequently to April 1, 1896, assistant general passenger and ticket agent of the same road at Montreal. On May 1, 1900, he was appointed passenger traffic manager of the entire system and at the time of his death was also passenger traffic manager of the Grand Trunk Pacific.

Jeremiah J. Coakley, superintendent of the Terminal Railroad Association of St. Louis, and the St. Louis Merchants' Bridge Terminal Railway, died in St. Louis, Mo., on April 21st, aged 54 years. He had been with the Terminal association for 35 years.

Maurice Dunnean, roadmaster of the Chicago, Rock Island & Pacific, at Goodland, Kan., was killed when a work train was wrecked near Colby, Kan., on May 1st.

William H. Frost, a pioneer railroad contractor who had part in the construction of the Boston & Maine R. R. and the Illinois Central R. R., died at his home in Independence, Kan., April 18th.

D. H. Gilman, a prominent organizer and builder of railroads in Washington and other western States, died April 28th, at Pasadena, Cal., aged 68 years.

J. C. McCabe, general freight agent of the Chicago, Rock Island & Gulf, with headquarters at Fort Worth, Texas, died in that city on May 3rd, aged 61 years. He began railway work in 1876 and had been connected with the Rock Island system since 1881, successively as traveling freight agent, commercial agent and second assistant freight agent of the Chicago, Rock Island & Pacific, general freight agent of the Chicago, Rock Island & Texas, and since December, 1903, general freight agent of the Chicago, Rock Island & Gulf.

F. H. Myers, division superintendent of the Chicago, Milwaukee & St. Paul Ry., at Minneapolis, Minn., died at his home in that city, April 8th, aged 38 years.

A. W. Quackenbush, formerly master mechanic of the Quincy, Omaha & Kansas City R. R., died in Kansas City, Mo., April 19th. Mr. Quackenbush was born at Paterson, N. J., February 1, 1845, and entered railway service in April, 1862. After holding various positions in the mechanical departments of other roads, principally in the east, Mr. Quackenbush was general master mechanic of the Wabash Western R. R. from January, 1887, to July, 1889; then and until December, 1892, superintendent of machinery of the Chicago & Alton R. R., and from July, 1892, to October, 1899, superintendent motive power and rolling stock, St. Louis, Cape Girardeau & Fort Smith Ry., at Cape Girardeau, Mo. From October 1, 1899, until his retirement, February, 1911, he was superintendent motive power and rolling stock of the Omaha, Kansas City and Eastern, Omaha & St. Louis, and Kansas City and Northern Connecting railroads, and later master mechanic of the Quincy, Omaha & Kansas City R. R. their successor.

Lieut.-Col. Wendell L. Simpson, U. S. A., retired, who has been the head of the purchasing department of the Panama R. R., at New York, for the last four years, died at his home in Garden City, Long Island, N. Y., April 23rd, aged 53 years.

Frank D. Tracy, real estate and tax agent of the Chicago & Alton R. R., died suddenly in Chicago, April 18th, aged 71 years. He had been in the service of the Chicago & Alton for forty years.

E. B. Wakeman, former superintendent of the Minneapolis Union Ry., from 1895 to 1904, died at his home in Holleywood, Cal., April 23rd. He was general superintendent of transportation of the Great Northern Ry. from 1892 to 1895.

John H. Weller, formerly superintendent of the Dayton & Michigan, now the Toledo Division of the Cincinnati, Hamilton & Dayton, died on April 22nd, at his home in Dayton, Ohio, at the age of 83.

Financial

Slackening in Business Activity.

ABOUT the best that can be said of the general business situation is that it might be worse. The tariff, the unrest of labor, and the continued condition of uneasiness in the money market make the general situation in the financial world uncertain. The result is seen in a slackening in business activity. The feeling in manufacturing circles is not optimistic although by no means dispairing. From a standpoint of new orders conditions are unsatisfactory. This is reflected in the heavy reduction in the Steel Corporation's unfilled tonnage in April. Incoming business is about 40 per cent below production. In the Middle West general business is still running at a high rate but there are many indications of a recession in activities. This is most notable in the steel industry where new orders have fallen off seriously. The railroads are also beginning to curtail their orders because of the difficulty in getting money. Western banks are making a persistent effort to contract loans which coincides with the condition of the business world to slow down, thus lessening the demand for money. In New England the business situation is decidedly unfavorable. The prospects in this section are for a long period of diminished industrial and commercial activity. The work of revising the tariff has been an extremely disturbing factor. A reflection of the attitude of New England towards the tariff is seen in heavy declines in the market value of mill stocks.

Digitized by Google

The Stock Market.

THE stock market has reflected the prevailing uncertainty. It has continued, for the past month, in a dull and listless condition. Little change in tone has taken place and the transactions have been small with few wide fluctuations. Some of the leading railway stocks, however, have reached lower prices than for years. The New York Central, New York, New Haven and Hartford, Pennsylvania, Canadian Pacific and the Central Railroad of New Jersey are examples of this decline.

The situation is not destitute of favorable features, however. With the recession in business activity and the passing away of the European war cloud, money is certain to be much easier. It is also reasonably certain, as Major Henry L. Higginson states, that the "country cannot go on paying two prices for labor and getting but one price for its products. Business and labor reached a high point last year, and I believe there would have been a liquidation of labor then had not the country produced bountiful crops to postpone the readjustment. Business is now starting to slow down, and labor, I believe, will soon have to decide that half a loaf is better than none. The change will mean a return to more economical methods of living for all of us. We will not buy new clothes and will find that our old ones can be made to do much longer. The realization will be good for all of us. Good crops will help towards lower living expenses, and there will have to be a general readjustment there also to lower price levels."

The severity of the recession in business will be greatly modified, according to present prospects, by excellent harvests. It is altogether too soon to forecast beyond the wheat crop, but the outlook for this staple is extremely favorable. Winter wheat covers an area, approximately, 16 per cent above that harvested last season and the condition of the crop is the best since 1905. The estimated yield is 513,000,000 bushels. Abundance of rain has fallen throughout the spring wheat region and throughout the corn and cotton belt. The outlook at the present time for all crops, in so far as conditions can be forecasted, is exceptionally favorable.

The Bond Market.

THE investment market is still in a most unsatisfactory condition. During April the average price of twenty-five representative railroad bonds declined more than a point, this being the third consecutive month of the decline. The average price now stands at 85.6 as compared with 89.1 three months ago. The *Wall Street Journal*, which furnishes this compilation, states that not since 1906, when the figures were started, has there been as persistent decline in bonds as during the last three months. The average is now more than twelve points below the high level of 1906, and only a little more than three points above the low level of 1907. From the high level of 1909 a decline has been nearly nine points, five of which have been lost during the past year. The reason for this decline in high grade bonds is the radical change in the attitude of the investor. These first class railroad securities for many years have had the preference. Now an issue of St. Paul bonds, offered at a price to net over 4½ per cent, fails to be fully taken up. The security of these bonds is perfect, the only question concerned the interest return. The investor has been educated to 5 per cent and, moreover, at the present time, with uncertainty which everywhere prevails, he prefers a short term obligation.

Railway Financing.

THE adverse condition of the bond market is reflected in a reduced amount of financing. During April the total financing of American corporations was $118,500,000. This was less than the total for any previous month of the year and also below the corresponding month of the two previous years. During the first six months of both 1912 and 1911 there were more securities issued each month than in April of this year. In spite of the depressed condition of the securities market, however, and the reduced volume of financing, the amount of securities issued is small only by comparison.

The total financing so far this year amounts to $819,500,000, or $12,500,000 more than for the corresponding four months of last year, and nearly $2,000,000 above 1911. A feature of recent financing has been the prevalence of note issues. New York Central has sold $22,000,000 of one-year notes, paying 5 per cent; Lake Shore $10,000,000 of the same character. Since January $175,500,000 of notes have been issued as compared with $415,000,000 of bonds and $229,000,000 of stock. The decline in stock quotations indicates the profound distrust with which industrial preferred stocks are now regarded. From $125,000,000 in January the total has declined to $12,500,000 in April.

Consolidation Plan of the New York Central.

THE most important new financing announced has been the consolidation plan of the New York Central. This system has been living from hand to mouth for three years and the expediency of consolidating the debt is now apparent. Before a bond issue of sufficient size to take care of the requirements of the company can be floated on advantageous terms, however, the system must be unified by merging the Lake Shore and Michigan Southern and all its various possessions in railroad properties in New York State into the parent company. The aggregate bond issue contemplated will be $500,000,000 and the mortgage, it is understood, will contain the novel feature that above $500,000,000 bonds can be issued without limit up to 80 per cent of the cost of work done or property acquired and subject to its lien. It is proposed to give the holders of New York Central 3½ per cent Lake Shore collateral bonds par in 4 per cent bonds to be issued under the new mortgage which, in turn, will be subject to the New York Central first mortgage dated June 1, 1897, and also to the underlying mortgages upon the other railroads which have been consolidated or merged. The total amount of bonds to be issued under this new mortgage will not exceed $167,102,400. at present. In time, however, all the underlying mortgages will be merged into the large refunding mortgage.

The New York Central has financed its present requirements by a sale of $10,000,000 of five per cent notes at 99½ which were quickly sold by J. P. Morgan & Co. The cost to the New York Central was about 5¾ per cent. As stated

Digitized by Google

above, the New York Central now has outstanding $70.000,000 of short term notes, not including $14,000,000 of temporary borrowing which is shortly to mature.

As was expected, after 21 years of dividend payment at the rate of 8 per cent per annum, the stock of the New Haven & Hartford has been placed on a 6 per cent basis. This will be fully covered by the earnings but no large surplus over the dividend requirements is to be expected. The company has suffered severely from the effect of the tariff agitation upon New England industries.

Railway Earnings for March.

THE "Wall Street Journal" for March, reports for 101 roads an increase of $8,850,411 in gross earnings or 4.18 per cent. Operating expenses increased so rapidly, however, that net earnings show a decrease of $4,970,795 or 9.4 per cent. The Reading Company reported for the nine months ended March 31st surplus earnings of $12,895,370. The increase over 1912 was over 55 per cent, and 1911 more than 10 per cent. The nine months' earnings equal 13.7 per cent on the common stock after a full year's appropriation for sinking fund and preferred dividend. For the year it is a safe estimate that Reading common will show 17 per cent earnings as compared with 6.8 per cent in 1912, 6.7 per cent in 1911, and 10.8 per cent in 1910. Figuring earnings before deducting additions and betterments shows an estimated return on Reading stock for 1913 of 20 per cent. When we consider that Reading is selling around 160, the possibilities of this stock from the standpoint of the investor seem to be extraordinary.

For March the Southern Railway made a gain in gross earnings of about $500,000 with an increase in net earnings, however, of less than $100,000. For the first nine months of the current fiscal year gross earnings gained over $4,000.000, but net increased only about $700,000. A large part of this increase in operating expenses, however, has been in the items of maintenance. Up to the end of March the outlays for maintenance were over $1,000.000 above those of the corresponding period of last year. The Southern's earnings are sufficient to pay the 5 per cent dividends on the $60,000,000 of preferred stock and show about 4 per cent earned on the $120,000,000 of common stock.

In the eight months ending February 28th, the Chicago, Burlington & Quincy showed a surplus, over interest and dividends, of over $11,000,000. Over 15 per cent was earned in this period on the stock. For the year ending June 30, 1912, the Burlington earned 12.7 per cent on the stock. The profitableness of their investment in Burlington stock to the Great Northern and Northern Pacific is seen in these figures. Burlington pays only 8 per cent dividends and could pay 10 without serious difficulty. The rapid increase in the efficiency of the Burlington is shown by the fact that whereas the ton mileage has almost exactly doubled, the train mileage has decreased over 8 per cent.

The St. Paul system in March, earned its fixed charges and dividends with a small balance. For the nine months ending March 31st last, the system earned 6.88 per cent on its outstanding capital stock. This is at the annual rate of 9.12 per cent. For the entire year it is a safe conclusion that the St. Paul will show about 8.¼ per cent earned on the common stock. This comfortable margin of surplus earnings over dividend requirements is made after allowing for $2,180,000 increase in maintenance expenses over the same period of a year ago. The outlook for the crops in the territory served by the St. Paul is very favorable and the lumber industry in Montana, Idaho and Washington promises an increasing amount of tonnage.

In spite of the decline in Illinois Central stock to $112 per share, a figure 4 points below the low point of 1907, the company is still earning at the rate of 7 per cent on its outstanding capital stock. There is no expectation that the semi-annual dividend which will be declared the latter part of June, will be at a lower rate than 3½ per cent. The company sustained some damage from the flood, not only to its property, but in a reduction of traffic. The Illinois Central has a large surplus, and it is not believed that the directors will cut the 7 per cent dividend unless conditions should grow much worse than at present.

The Pere Marquette earned a surplus over all charges in March which was the largest net earnings in over two years. During three months Receiver and General Manager Felton increased the operating income of the company by $890,000 on a revenue gain of $550,000. Until a good margin in surplus earnings has been arrived at, nothing will be done towards formulating a plan of reorganization. The value of good management to a railroad was never more strikingly illustrated.

Railway Business for March.

FOR the month of March the operating income per mile of line decreased 31.3 per cent for the railways of the east, increased 6.6 per cent for the railways of the south and increased 9.4 per cent for the railways of the west as compared with March, 1912. The average for the railways of the entire country decreased 9.9 per cent.

This operating income for the 222,086 miles of line summarized by the Bureau of Railway Economics from the reports of the railways to the Interstate Commerce Commission aggregated for the month $52.137,897, or $235 per mile of line, which is equivalent to $7.57 per mile of line per day. Operating income is that proportion of their receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction and for dividends.

The aggregate of the total operating revenues for the month was $241,048,818, an increase of $9,864,272 over March, 1912. The operating expenses were $178 234,167, or $14,104,236 more than for March, 1912. The net operating revenue was $62,814,651, or $4,239,964 less than for March, 1912. Taxes were $10,418,258, an increase of 7.7 per cent per mile of line over March, 1912, leaving the operating income 9.9 per cent less per mile of line as stated.

Receivership for the Frisco.

THE most important announcement in railroad finance was the statement that on May 27th, Benjamin L. Winchell, president of the St. Louis and San Francisco, and

Digitized by Google

Thomas H. West, chairman of the Board of Directors of the St. Louis, Union Trust Company, were appointed receivers for the St. Louis and San Francisco by Judge Sanborn in the United States Court of Appeals in St. Louis. The receivership was asked for by representatives of $50,000,000 of bonds of the company. On complaint of the Railway Steel Spring Company, receivers for the Chicago and Illinois, were appointed in Chicago on the same day.

The receivers named for the Chicago & Illinois are William J. Jackson, vice-president of the road, and Edwin W. Winters, of New York. While this receivership is unfortunate, the resulting reorganization will probably place the property on a much sounder footing. The trouble with the St. Louis and San Francisco is an excess of bonded debt. It has $50,000,000 of stock, common and first and second preferred, but the common has never paid a dividend, and the second preferred has paid no dividends since 1906. The last report for the year ending June 30, 1912, showed a total net income of $12,992,510, and after deducting fixed charges, a deficit of $22,343. Operating revenues have been stationary for several years. The unfortunate situation of the company is the result of the purchase of properties at high prices which have not justified the expectation concerning them. Several of these companies have not earned fixed charges. This has been true of the St. Louis, Brownsville and Mexico, and the New Orleans, Texas and Mexico. The obligations assumed in connection with the acquisition of the Chicago and Eastern Illinois have also proven to be excessive. The St. Louis and San Francisco has a great variety of obligations outstanding, including 15 series of equipment trust notes. It has two issues of stock trust certificates and several note issues and two large bond issues secured by general and refunding mortgage. The reorganization will undoubtedly simplify this complicated financial structure, scale down the debt, substituting for the bonds preferred stock, or some obligation whose interest will depend upon earnings, and provide an ample bond reserve to take care of the future requirements of the property. The lines of the company are favorably located, some of them, however, in new territory whose development has not gone forward with the rapidity which was expected.

Operation

Progress of the "Safety First" Movement.

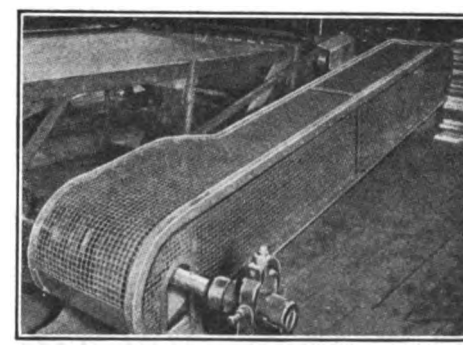
THE remarkable movement for the conservation of the life and limb of railway employes, which has become known in railway circles and by the public at large as the "Safety First" movement, steadily progresses. One of the most important developments recently noticed is the progress toward the standardization of this work in every way in which this can be profitably done. We reproduce herewith some illustrations showing in a concrete way the results of the policy of standardization. These photographs show the standard specifications for guards for wheels and other dangerous parts of the machines adopted by the New York Central System. It will be noticed that through the use of a wire gauze it is physically impossible for even the most careless workman to come into contact with any portion of the moving machinery.

Along with this effort to remove the possibilities of accidents equally rapid progress is being made toward more effective training of the men and the inculcation of the proper methods of work which will eliminate those causes of accidents which cannot be prevented through the use of safety appliances. The psychological portion of the "Safety First" campaign is in many ways most interesting because it is an attempt to solve a problem which is the most difficult of all of the problems which are involved in railway operation.

General Manager S. C. Long, of the Pennsylvania System has issued a booklet, which has been given wide circulation among employes, entitled "Why Railway Employes Should for Their Own Safety Demand the Maintenance of Discipline." Mr. Long emphasizes the point that the real secret of accident prevention is discipline. Discipline has been found necessary in connection with armies and every other large organization of men, and it should be enforced with equal rigidity and effectiveness on the great industrial armies.

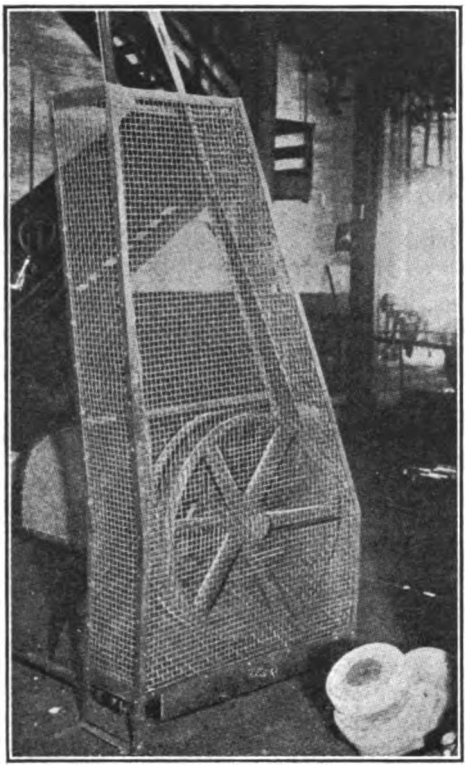
Not only are efforts being made to teach railway men to avoid accidents, but a campaign has been started on a number of systems, as for example the Lehigh Valley, to eliminate the trespassing evil, which is responsible for a large proportion of railway injuries. The Chicago and North Western has started a campaign under the slogan "Save the School Children," which has for its object to impress upon children the danger in trespassing upon railroad property. A pamphlet has been published by Mr. Ralph C. Richards, chairman of the Central Safety Committee, a large number of which has been distributed by this company to school principals and others who can render effective work in this campaign.

A novel feature in the safety work of the month was evolved by Mr. E. L. Tinker, head of the Safety Bureau of the El Paso Southwestern Railroad, who has devised "Safety First" bands for cigars and cigarettes. Such cigars and cigarettes have been placed on sale in a large number of stores in the territory served by this system,



DYNAMO GUARDED BY WOVEN WIRE, ACCORDING TO STANDARD SPECIFICATIONS.

Digitized by Google



FLY WHEEL AND BELT GUARDED BY WOVEN WIRE ACCORDING TO STANDARD SPECIFICATIONS.

and are reported to be quite popular. The same corporation is arranging to have films designed to give instruction in safety to be shown in moving picture establishments in the towns which it serves.

A most impressive fact in connection with the experience of this company was brought out at the recent meeting of the "Safety First" managers of the various railroads in Chicago. The El Paso and Southwestern Railroad recently completed the construction of a line to Tucson, Arizona. This work occupied a period of twelve months, during which time about twelve hundred men were employed. Through the co-operation of the local authorities no saloon was allowed to establish itself along the line of construction, a distance of 65 miles. The result was that drunkenness was practically unknown, and not a single man was killed on the work, although there was a large amount of rock cutting where high explosives had to be handled

We commented in our May issue upon the very important meeting of the "Safety First" officials of thirty-four railroads at Chicago. As a result of this meeting an organization known as the "National Railway Safety First Association" was created, the original members of which were made up of the companies these represented. This organization is to begin a campaign of education with a view to reducing accidents on railroads. Bureaus of information are to be established in several large cities, where lectures on railway safety will be delivered. The chairman of the Association is Mr. A. W. Smallen, who is also chairman of the General Safety Department of the St. Paul System.

The Chicago and North Western Railway Company has issued an order to all crossing flagmen and watchmen to report the license number of automobiles driven recklessly across railway crossings, to the superintendents of their respective division . Section foremen, agents and roadmasters are instructed to check the work of crossing watchmen as regards this matter and see that they report all reckless chauffeurs or automobile drivers and in fact anyone who crosses a railroad in a careless or reckless manner. It is the intention of the company to follow up all of these reports and to endeavor, in so far as possible, to eliminate such practices, which are responsible for a large majority of accidents at crossings.

An interesting feature in the development of the safety movement has been the use of the instruction cars formerly provided by railroads for the purpose of training men in the handling of equipment, such as air brakes, etc. The Lehigh Valley announces that its traveling instruction cars are to be a permanent institution, and they are to make trips over every part of the system at regular intervals for the purpose of refreshing the memory of the men on those things concerning which they are likely to become hazy or careless. The Wabash Enginemen School of Instruction is also doing similar work—in fact every company has placed particular emphasis in its technical instruction upon the matter of safety.

Signal Developments During the Month.

CONSIDERABLE concern is beginning to be apparent concerning the prospect of the passage of the bill introduced by Congressman Mann, of Illinois, requiring the installation of automatic stop signals on every mile of track within the country. While it is improbable that anything will be done with this bill at the present session of Congress, yet it is reported from numerous quarters that there is very strong sentiment in support of the measure. To anyone familiar with the present status of automatic train stops as a mechanical proposition such a movement seems absurd. There are about 200 patent automatic stops at the present time, of which less than half a dozen—as is evidenced by the careful investigation of the New Haven System—have any merit. The railroad companies are busily engaged in testing out and endeavoring to perfect such of these devices as possess merit, and until one or more devices have been thoroughly tried under all conditions and perfected to the point where they give satisfactory service, it is folly for Congress to force the railroads to take this momentous step. The adoption of such a signal system would require a staggering expenditure which is not warranted until the efficacy of the automatic train stop has been proven beyond doubt.

Two railroad systems—the Lehigh Valley and the Lehigh and New Enpland—have announced within the past month that they will complete the installation of telephones to replace the telegraph in train dispatching. The Lehigh Valley announced that beginning May 15th the telephone dispatching system will displace the telegraph for train movements. Every freight, passenger train, work train and every section gang is to be supplied with a portable telephone set, which by means of a pole can be connected with the over-

Digitized by Google

head wires strung on poles on the right of way. In this way it is possible for any train crew or section gang to get into immediate communication with the nearest dispatcher and to either report trouble or any fact which should be promptly communicated to their superiors. In the case of wrecks it is possible to get word of the disaster to headquarters in a much shorter space of time, which frequently is of the greatest importance where persons have been seriously injured. In addition, more than 150 so-called siding telephones have been placed in cement booths and freight houses. The booths are equipped with a shelf, the necessary order blanks and a metal box in which to deposit copies of train orders received. The siding telephones are placed at points where, under former conditions telegraph operators were not employed, and where trains were delayed for lack of information.

The Lehigh and New England Railroad Company expects to have its telephone installation completed by June 1st, at which time the telegraph will be superseded. This company has used the telephones heretofore to considerable extent in connection with small branches where it did not pay to maintain telegraph operators.

Under a new law recently enacted in the state of New York, which is now effective, the railroads are required to give two full days of vacation with pay every month to their tower and signal men. The law is in the form of an amendment to the labor law, and provides that any person employed in the capacity of a tower or signal operator, or in any capacity in signal towers, or in connection with signal work, and who works eight hours out of the twenty-four every day in the week, must be given at least two full days of vacation a month without loss of compensation. It is not believed that any considerable number of additional relief men will be necessary.

The Inadequacy of Compensation to Railways for Handling Mail.

WE reproduce herewith two most instructive and valuable charts, which were submitted by Mr. W. A. Worthington, vice-president of the Southern Pacific, at a hearing before the Congressional Committee on Postage on Second Class Mail Matter and Compensation for the Transportation of Mail, held in Washington on March 27th. These charts were presented incidentally in the presentation of a statement (on behalf of the Southern Pacific Company) concerning the adequacy of compen-

sation. Mr. Worthington points out that while the railroads received 34 per cent of the total postal receipts in 1901, in 1911 the proportion so received had declined to 10 per cent. Judged from another standpoint, and using as a basis of comparison 1,000 passenger train miles run on the railways of the country, there was a decrease from 1900 to 1911 of 14 per cent in the mail revenue as compared with the increase of 31 per cent in revenue from passenger, and 61 per cent in revenue from express traffic. During the same time the railway operating expenses for 1,000 train miles were increased 44 per cent. A study of Mr. Worthington's chart will be of value to any railway man.

Efficiency in Railway Shops.

MR. HARRINGTON EMERSON, who is well known to railway men in connection with his studies in scientific management, has contributed a most interesting article to the May issue of the *Engineering Magazine*, concerning the technical efficiency of the shops of the Pittsburgh and Lake Erie Railroad. Mr. Emerson has unstinted praise for the shops of this company, particularly for its blacksmith shops. He points out that while the ordinary blacksmith shop is dirty, dark and uninviting, yet through the careful design and equipment of its shop the Pittsburgh and Lake Erie have been able to overcome all of these defects. The accompanying illustration shows the method by which this was accomplished.

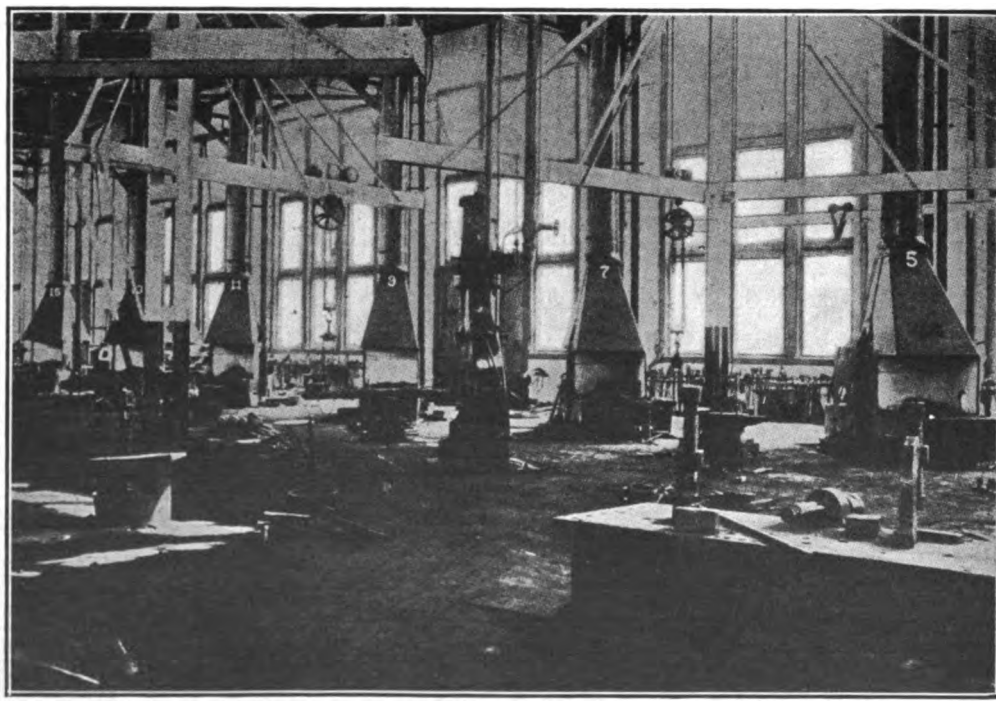
In connection with his discussion of shop practices he brings out considerable interesting information. He states that this company has found that cleaning steel cars, preparatory to painting, with a sand blast is not as economical as hand work. Four men clean eight cars a day, the average wage being $2.20, which makes the cost per car with hand work of $1.10 as compared with about $5.20 per car for sand blast cleaning. The cars are painted at the rate of 20 per day with an air brush, which uses less paint and saves the expense of brushes, as compared with hand painting. Much attention has been given to developing standards of paint and in varying the practices of applying it under different weather conditions.

Report on Revision of M. C. B. Rules of Interchange.

THE Standing Committe on the revision of M. C. B. rules of interchange of the Railway Club of Pittsburgh presented its annual report at the meeting of that organization, held March 28th last. This committee has for some time been canvassing the members of the Club for recommendations and suggestions which might profitably be investigated and reported thereon to the Master Car Builders' Association. A similar committee of each of the other Railway Clubs is likewise engaged in such investigation.

The suggestion made by the Jamison Coal and Coke Company that the addition of 10 per cent to the total bill for repairs is an excessive charge and should be eliminated was disapproved by the committee on the ground that the cost of making repairs under the existing schedules, and including the 10 per cent charge, was no greater than the actual expenditure to which the railroads were put for such work.

In response to the invitation of the Arbitration Committee of the M. C. B. Association, the Railway Club of Pittsburgh appointed three representatives who, together with a like number from each of the other Railway Clubs, will gather to-



GENERAL VIEW OF THE "WHITE BLACKSMITH SHOP" OF THE PITTSBURGH AND LAKE ERIE RAILROAD

Digitized by Google

gether at some convenient point to discuss the suggestions for changes in the rules. The recommendations for changes made by the committee apply to some forty-seven rules covering a wide range of subjects. None of these suggestions are of a revolutionary character, the majority of them dealing with a clarification of the language or the covering of points which in practice have found to be unprovided for in the existing rules. The most important changes proposed are those relating to compensation for damage to cars with wooden underframes as regards which the committee proposes an entire reconstruction of the rules. Changes are also proposed in the rules concerning composition wood and metal underframes and all steel or all steel underframe cars, as regards the loss. The committee reports that the existing rules cannot be consistently applied, and are, therefore, unsatisfactory. The changes proposed make the handling road responsible for all repairs necessitated by unfair usage, derailment or accident to all steel or all steel underframe cars. The car owner is held responsible for repairs due to ordinary wear and tear, corrosion and weak construction.

It is further proposed that where the damage to cars exceeds a stipulated amount, and where the car owners have decided to tear down the injured equipment instead of repairing it, intending to replace it with more modern equipment, that the car owners shall have the right to bill the responsible company for the damage done, irrespective of whether it intends to reconstruct the car.

With reference to the cars found unsafe on account of general decrepitude, due to age, decay or corrosion, the committee proposes that the fact shall be reported to the owner, who shall have the right to elect to have it sent home. If he decides to have it returned, he shall furnish *four home cards* noting upon them existing defects When the cars are returned they are to be sent over the shortest route. The car owners are to be responsible for temporary or partial repairs necessary to enable them to be moved safely. Of the four cards furnished, one is to be retained by the forwarding road, one for manifesting purposes, and the other two to be attached, one to each side of the car.

Report of the Interstate Commerce Commission on Block Signals.

IN the May issue of the RAILWAY WORLD a brief summary of the advance report of the Interstate Commerce Commission's annual report as of January 1st, 1913, on "Block Signals on the Railroads of the United States," was given. The complete report is now available and consists almost entirely of statistical tables covering the usual range. In brief, the Commission finds that on the railroads of the country there has been, during the calendar year 1912, an increase of 1,883 miles in the miles of road covered by automatic block signal miles while in the same period there has been a net increase of 5,656 miles of road controlled by manual signals. This gives a total net increase in the mileage on which block signals of one character or another are installed of 7,540 miles as contrasted with an increase of 5,140 miles in the preceding year. Discrepancies are manifest in the reports of a considerable number of companies, and any comparison must be approximate in the absence of explanations of these various matters.

The Missouri-Pacific alone reports an addition of 4,445 miles to its block signaled lines, representing considerably over half of the total increase during the year. Concerning the proposed new signal work during the year 1913, the larger installations in point of mileage are as follows:

Pacific System, 463 miles; Pennsylvania System, 366 miles. (Most of which, it is inferred, is the improvement or replacement of existing installation); Northern Pacific, 366 miles; Erie, 307 miles; Atchison System, 300 miles; Wabash, 244 miles; Illinois Central, 215 miles; Northern Pacific, 175 miles; Missouri, Kansas and Texas, 105 miles. A considerable number of other companies have in contemplation signal installations of a total length of 100 miles or less.

An interesting feature of the contemplated work is the proposed installation by the Pennsylvania of 19.3 miles of track equipment for the use of automatic train stops; the Washington Water Power Company also proposes to so equip 22.5 miles of single track.

Physical Development of the Pennsylvania System in 1912.

IT is possible, with the issuing of the Annual Record of Transportation Lines of the Pennsylvania System, to secure an accurate picture of the growth and development of this great system during the year 1912. Since 1902 the mileage of the Pennsylvania system has increased only 1,088 miles, while the increase in second, third and fourth track mileage has been respectively 1,335, 277 and 224 miles. As contrasted with this increase in the main track mileage, the mileage of "company sidings" has been increased from 5,916 to 8,965 miles, or a net growth of 3,049 miles. This growth in the mileage of sidings indicates graphically the increased volume of business of the system which has made this additional trackage necessary.

Another interesting fact brought out in connection with this annual compilation is that the system now has something over 100,000 shareholders, or on the average nearly four for every mile of trackage. During the year there were approximately eight employes for every mile of track. The total amount paid out for wages was $188,749,312.

New Egg Inspection Rules.

NEW rules concerning the shipment of eggs, and the inspection of consignments for damage thereto have been agreed upon by a committee of dealers from the Merchants' Exchange of New York City and the railroads centering into that point. The new regulations are effective May 15th. The rules provide, in brief, that all shipments of eggs shall be subject to inspection by inspectors of the Trunk Line Association; that no examination of cases shall be permitted except those showing external evidence of damage, and where no external evidence of damage is present, the consignees will be required to take delivery and give receipt for the entire quantity in good order; where external evidence of damage exists, the consignee is to have the right of making an examination previous to giving a receipt for the shipment; when shipments are delivered to a storage warehouse an allowance of not more than 10 cents per

Digitized by Google

case is to be made for repairing cases which show external evidence of damage. In no case is an inspection to be expected by a carrier's representative after the consignees have taken delivery. Where consignment in whole or in part is refused by the consignee because of evidence of damage it shall be sold by the carrier and the net proceeds remitted to the owner or consignee. When such remittance has been made no further claim will be entertained concerning the refused shipment. The basis for the adjustment of claims will be in accordance with Section 3 of the uniform bill of lading, i. e., bonafide invoice price at the place and time of shipment. If there is no invoice, settlement will be based on market value at destination on date of shipment was due to arrive, less freight, cartage and commission.

When shipments are loaded by shippers (bills of lading bearing notation "S. L. & C."), and check short at destination, any claims thereon will be declined when cars arrive under original car seals.

When shipments are loaded by shippers (bills of lading not bearing notation, "S. L. & C.") and check short at destination, any claims thereon will be declined when cars arrive under original car seals. In the settlement of claims for cracked eggs, the allowance therefor will be based upon the difference between the current price for cracked eggs in the same current price of sound eggs in the same shipment.

In the settlement of claims for stained or wet eggs, the allowance therefor will be based upon the difference between the current price of stained or wet eggs and the current price of sound eggs in the same shipment. During the period when no quotations are available on stained or wet eggs, the basis for settlement will be determined by current market conditions.

Baltimore and Ohio to Pay Semi-Monthly.

ON June 1st the Baltimore and Ohio will begin the policy of making semi-monthly payments of wages to its working force. The Auditing and Treasury Departments of the company have for some time been at work on the details involved in the change. The reason for the change in system, which will involve a considerable expense, is the passage of laws in the states of Indiana, Ohio and Pennsylvania requiring bi-monthly payments. In view of the large amount of territory affected by these laws, the company decided to extend the same policy to the state of Maryland and elsewhere where legally such a course was not obligatory.

It is contended that this change will affect a material saving to the employes of the company in that they will be able to pay cash to a greater extent than heretofore, and hence secure better prices. Against this advantage is the heavy increase in the cost of handling the pay roll to the company, this being an example of the sort of legislation which has brought about conditions requiring the railroads to once again apply to the Interstate Commerce Commission for permission to raise rates.

PRESIDENT PETERS, of the Long Island Railroad Company, has announced that June first the Adams Express Company will take over the plant and service of the Long Island Express Company. The reason for the change, according to the official statement, is that the Adams Express Company "will be in better position to make through rates and to perform through service than has been possible under the operation by the railroad company of its own express service." The Adams Express Company will take over all of the equipment of the Long Island Express Company as well as its organization and operating staff.

Terminal Improvements in Canton.

THE Canton Railroad, controlled by the Canton Company, is about to place in service a group of commodious warehouses which, in connection with its terminal road, will greatly facilitate the interchange of freight, eliminating much useless switching into and out of that city. The Canton Railroad Company will receive freight at its warehouse consigned over the Baltimore and Ohio, the Pennsylvania or the Western Maryland systems, and will switch it to the lines of the designated companies without charge. This will serve as a belt line through the business district of the city, and besides eliminating switching charges, will greatly facilitate the speed of freight movement.

Federal Report on Air Brake Tests.

CHIEF Inspector of Safety Appliances Belnap has presented to the Interstate Commerce Commission his report concerning the work done under his direction in the inspection and testing of air brakes during the calendar year 1912. His computations show that the number of observed defects as regards air brake appliances on freight and passenger cars and locomotives was 73.45 per thousand inspected. He states that: "Our inspectors have frequently made terminal tests which disclosed the fact that the proportion of operative air brakes on trains about to leave their terminals was less than the percentage required by law. Had these trains, in fact left their terminals in that condition our inspectors, in the performance of their duty would have been compelled to file evidence of such violations of the law for prosecution. However, the train crews being present at the time such inspections were made, and realizing the imminent danger to themselves and to opposing trains, the matter was promptly reported to the official in charge, by whom the necessary repairs were ordered.

"The stenciling of cars 'United States Safey Appliances' and 'United States Safety Appliances, Standard,' seems to have confused many employes of the railroads. The Master Car Builders' Association, at its annual convention in 1911, adopted a rule requiring carriers to mark all cars which have been brought into the condition permitted under the extension order as well as those which comply absolutely with the order prescribing the standards. The significance of the markings is that when a car is marked 'United States Safety Appliances, Standard,' the car complies absolutely with the order of March 13, 1911."

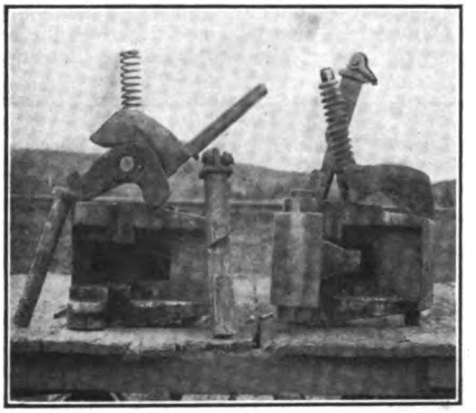
Mechanical

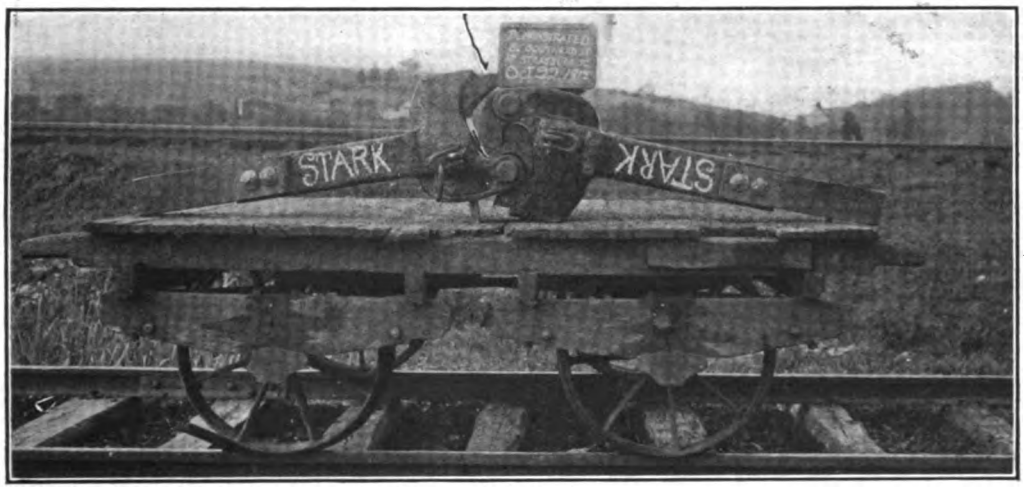
A NEW CAR COUPLER

WE present herewith two photographs of a new car coupler which has been successfully tested on the Southern Railway, and which is causing considerable interest among mechanical and operating officials. The device is manufactured by the Stark Car Coupler Company, Strasburg, Virginia.

The novelty of the coupler rests in the fact that the guard arm is held in position by a steel spiral spring somewhat on the principle of a door latch, that lets the knuckles pass over. When they are in position, all the responsibility is off the spring and the knuckles, to be raised again, must be relieved by raising the locking pin. It is asserted that the coupler is strictly automatic and that it does not matter in what positions the knuckles are, as they will always couple without their manipulation by hand. The spring referred to moves the guard arm, keeping it in position, and the tests so far made appear to indicate that it cannot be broken in its housing. In fact, these tests have proved it to be the strongest part of the coupler. It is asserted that there is no degree of curve that an engine cannot be operated on which will not permit easy and automatic coupling by means of this device.



VARIOUS PARTS OF THE STARK CAR COUPLER.



THE STARK CAR COUPLER.

Referring to tests made on the Southern Railway tracks at Strasburg Junction, the Strasburg *News* has in part the following to say:

"The special train furnished by the Southern Railway and composed of an engine, a coach, and two box cars carried a number of the witnesses to the Junction. The first tests were made on the east leg of the Y, a track of about twenty degree curve. The embankments on both sides of the track were crowded with spectators, the greater part of whom had never seen the new device in operation. The first trial was made with both knuckles closed, the second with one closed, and the third with both open. Each time the knuckles locked perfectly, which is rather remarkable when one considers the fact that it is very hard to lock the present couplers at all on a curve of such a degree. Tests were made over and over again in every way imaginable, with heavy compact, with comparatively no jar at all, with the couplers placed out of line as far as they could be drawn and each time there was not a hitch, a perfect coupling was made.

"Similar tests were then made on tracks of lesser degree curve with similar results. The two great features of the Stark Car Coupler revealed by the demonstrations are these: It will couple on a greater degree curve than any engine can be run without any adjustment, and secondly it will couple automatically, thus preventing the loss of hundreds of hands and feet of trainmen."

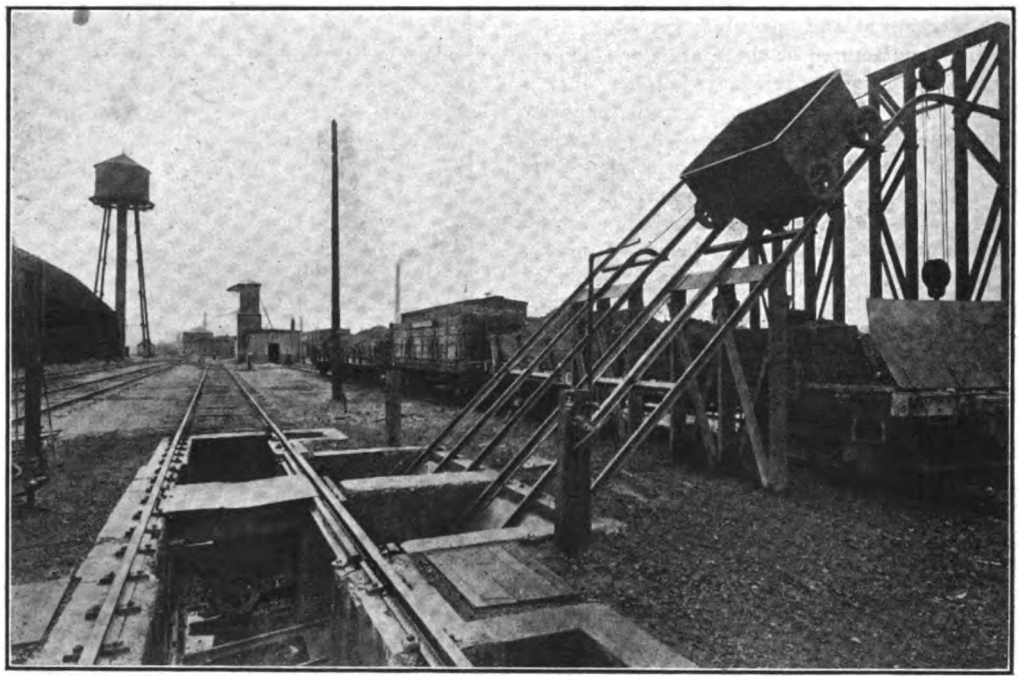
AN EFFICIENT CINDER CONVEYOR

THE accompanying illustration indicates the design and construction of an interesting cinder pit machine which transfers the cinders from the pits to adjacent cars. It is employed as an economical and rapid method of transference and increases and improves the service of the cinder pits. As noted the cinders are hauled up in the conveyor car and automatically unloaded into the waiting cars. The operation is by compressed air from the round house reservoir, at isolated terminals, by air from the locomotive. It may also be operated by electricity or steam. It obviates the necessity for shoveling or the construction of large storage pits.



CINDER CONVEYOR TRANSFERRING CINDERS FROM LOCOMOTIVE PIT TO CARS.

A NOVEL UNLOADING MACHINE FOR VESSELS

THE transportation of iron ore and coal on the ocean has been a serious problem, owing to the meager facilities for unloading and the impracticability of installing machinery for unloading vessels similar to that on the Great Lakes, on account of the immense investment for special docks and equipment which could be used only intermittently.

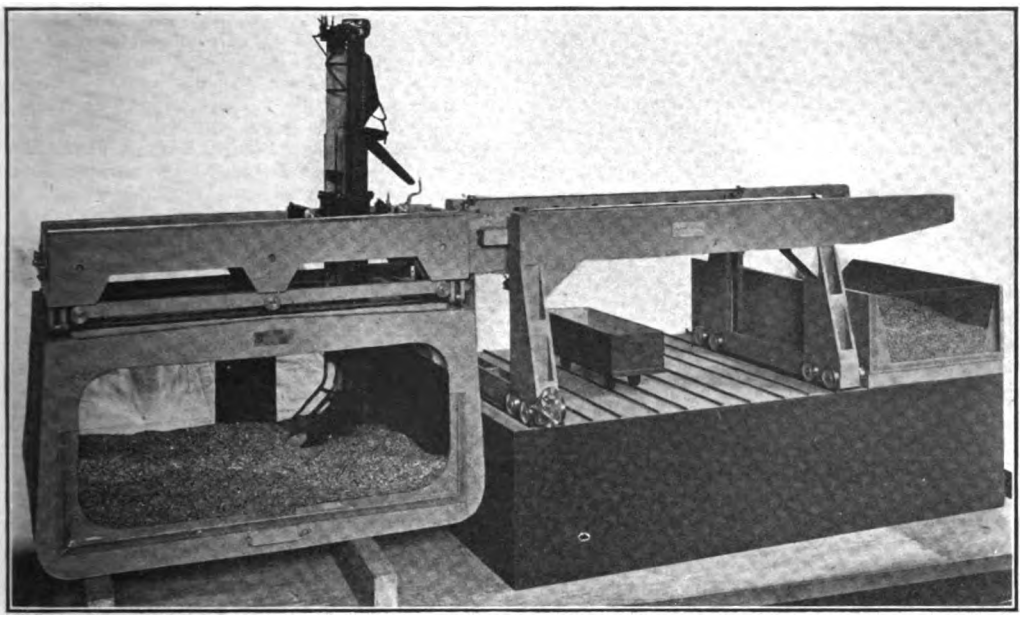
In order to overcome this difficulty, special freight steamers have been built with bins and cranes, and many others of different types, all being expensive in first cost, operation and maintenance, although they are improvements over the old methods which still obtain in some parts of the world.

Notwithstanding the great amount of ingenuity which has been expended and the many inventions along this line, the problem still seems to be a live one as indicated in a Consular Trade report on the subject, which says: "With the decreasing dependence which can be placed upon European sources of supply, it is beginning to be seen that the future reliance of Continental nations with deficient home supplies of coal must be upon the great deposits of North America. The question of importing American coal to France has been repeatedly raised, but has always encountered the difficulty of adequate return freights for coal-carrying vessels. Coal has such weight and bulk in relation to value that it has been hitherto found impracticable to export it profitably to France at current prices by vessels which would be obliged to make the return trip in ballast.

"The time has now apparently come when the great coal mining and shipping companies of the United States should take up this subject seriously and decide whether a special class of ocean-going steam barges of large tonnage, moderate speed, and built like the ore-carrying craft of the Great Lakes, to secure every economy in crew and equipment, might not solve the problem of transportation, and open to our exporters the rich and permanent market in France, which, with due enterprise and effort they will surely obtain."

To meet the requirements and conditions thus briefly referred to a new vessel unloading machine of the Kindl type has recently been designed at Pittsburgh, as shown in the following illustration. This machine may be compared to a steam shovel, operated by electricity, placed upon a crane-girder and carried by a vessel, or it may

Digitized by Google



MODEL OF UNLOADING MACHINE SHOWING METHOD OF OPERATION.

be transferred to a bridge on the dock. The bucket is of such construction that it can be used for ore, sand, coal or limestone. The filling of the bucket being a shoveling action under the control of the operator, it is necessarily less degrading to coal than the well known action of the grab-bucket. It will discharge to cars or to a stock pile and successfully transfer the material from stock to cars or vessels, without auxiliary hoisting devices.

The weight of the machine and crane-girder, as designed to be carried by a vessel, is approximately 50 tons, which is a very small dead weight when compared with the weight of steel for bins and cranes on the European ore and fuel vessels and the special construction and machinery for recent colliers in this and other countries. It has a discharging capacity to meet any reasonable demand and a floating coal storage can be equipped with this machine to bunker coal for steamers. The loose bucket, of five yards capacity, weighs approximately two tons, and makes two trips a minute. Each machine requires not more than two men to operate.

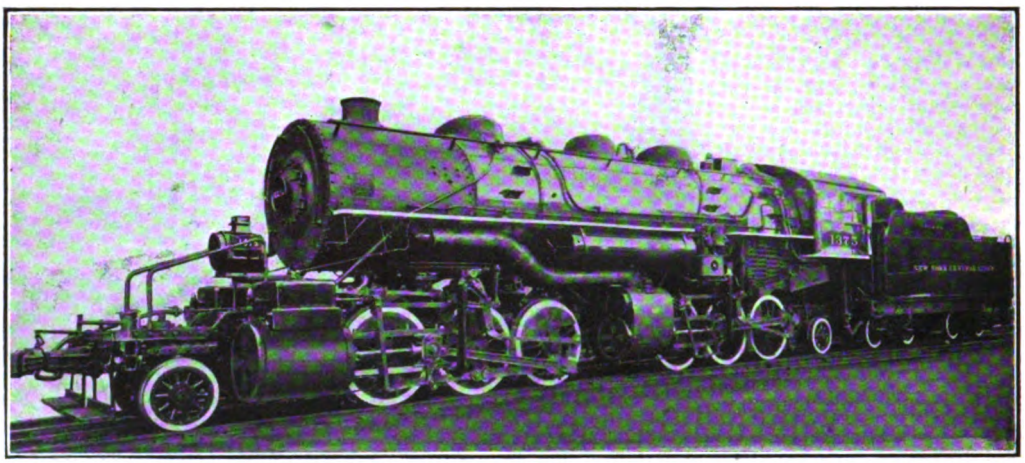
A MODERN LOCOMOTIVE AUTOMATIC CONTROL

THE accompanying illustration shows a modern Mallet locomotive of the New York Central Railroad equipped wth the automatic control equipment of the New York Air Brake type developed at Watertown, N. Y. This equipment furnishes the advantages of the combined automatic and straight air brake, with additional features. The apparatus is the same for all locomotives and can therefore be applied to passenger engines hauling either high speed trains or ordinary passenger trains, and to locomotives in freight or switching service, or for double pressure control operation, the automatic control equipment being identical in all cases and simply adjusted for the character of service. The locomotive and train brakes can be used together, or the locomotive brakes separately, as desired, and it makes no difference in what part of the train the locomotive is located. The brakes can be applied as lightly or as heavily as desired, and the brake pressure so obtained will be automatically maintained in the locomotive brake cylinders, in spite of leakage or variation of piston travel. The locomotive brakes can be graduated on and off as desired thus enabling better stops to be made, and assuring smooth handling of trains.

One important feature of the automatic and straight air brake is part of the automatic control equipment, viz., maintaining the automatic and straight air brakes as two separate units, so that their operation can be independent of one another. In case either the automatic or straight air brake should become inoperative, the defective brake will therefore not interfere with the proper operation of the other brake.

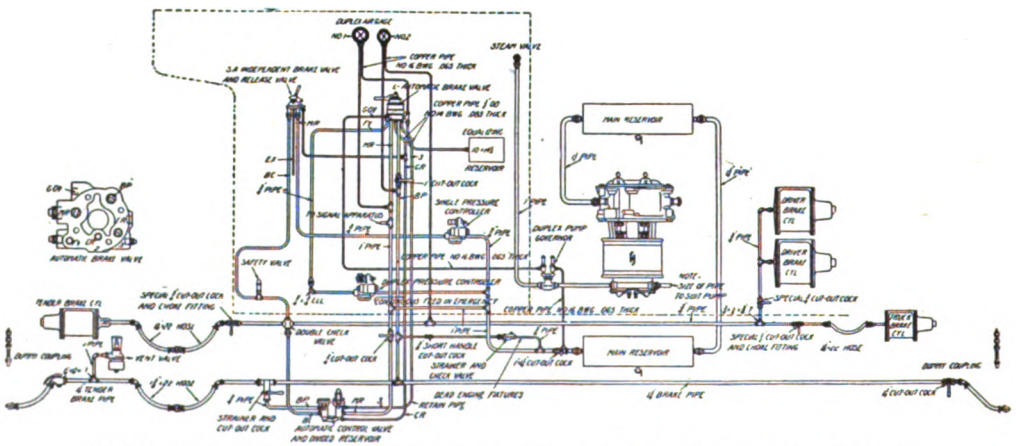
When not in use, the handle of automatic brake valve is kept in running position, and the handle of straight air brake valve in the release position. For service application the handle of the automatic brake valve is moved to the service position until the required reduction is made, then back to lap position which is the position used to keep brakes applied. In order to release the train brakes the handle of the automatic brake valve is moved to the release position and held there until all triple valves are released. If the locomotive brakes are to be released at once, the running position is used, but if they are to be held on for a time, movement is made to the holding position, and then graduated off as desired, by short movements between running and holding positions.

Digitized by Google



MODERN MALLET LOCOMOTIVE OF THE NEW YORK CENTRAL EQUIPPED WITH AUTOMATIC CONTROL EQUIPMENT.

The piping arrangements are simple connecting the control reservoir of the automatic control valve, to the automatic brake valve and to the independent locomotive automatic release portion of the straight air brake valve. The brake pipe connects the automatic brake valve to the automatic control valve and all triple valves and the brake cylinder pipe connects the automatic control valve to the driver, tender and truck brake cylinders, through the double check valve while the discharge pipe connects the air pump to first main reservoir. The automatic control valve release pipe connects the control reservoir exhaust port of the automatic control valve to the automatic brake valve and the equalizing pipe connects the two main reservoirs while an excess pressure governor pipe connects the feed valve pipe to the excess-pressure head of pump governor. A feed valve pipe leads from feed to the automatic brake valve and the main reservoir pipe leads from the second main reservoir to pump governor, reducing valve, feed valve, automatic control valve and automatic brake valve. There is a reducing valve pipe which connects the reducing valve to straight air brake valve; also to the signal system when desired, while the straight air pipe leads from straight air brake valve to the double check valve.



PIPING DIAGRAM, SCHEDULE LT-2 (AUTOMATIC CONTROL EQUIPMENT).

CONVENTION OF MASTER BOILERMAKERS' ASSOCIATION

THE seventh annual convention of the Master Boilermakers' Association was held at the Hotel Sherman, Chicago, on May 26th to 29th inclusive. In addition to the regular routine work the convention listened to and discussed a number of interesting and valuable reports prepared by its standing and special committees.

When Is a Boiler in a Weak and Unsafe Condition?

IN answering the question which had been propounded, "When is a boiler in a weak and unsafe condition?" the committee reported that "a general answer is that a boiler is in a

Digitized by Google

weak and unsafe condition when the internal pressure approaches the rupture point of its weakest part." It was the conclusion of the committee, moreover, that "an explosion is never an accident and is always preventable; because it proceeds from a cause which might have been foreseen. The defect could have been remedied and the explosion prevented."

Beginning with these two principles, which largely represent the conclusions of the committee, the report proceeds to enumerate the causes of boiler troubles, which are found to be:

1. Faulty and defective design.
2. Poor material.
3. Poor and careless workmanship.
4. Improperly made repairs.
5. Bad material.
6. Improper care.

As regards the first cause—faulty and defective design—the committee finds that "a well designed boiler should have every part of the same strength and at all temperatures, so placed that adjacent parts will expand and contract together under all conditions and will not work against each other, thus producing strains in the structure that will ultimately tend to wreck it. All material should be uniform throughout, strong enough to carry its individual load, but not so strong as to fail to give and exert force on any other member of the boiler.

The second cause—poor material—results either from the purchase of inferior material by the company, or more frequently from careless handling in the forge fires or in some other process while it is being manufactured. This is a matter which requires careful inspection, both by builders and by the railroad companies.

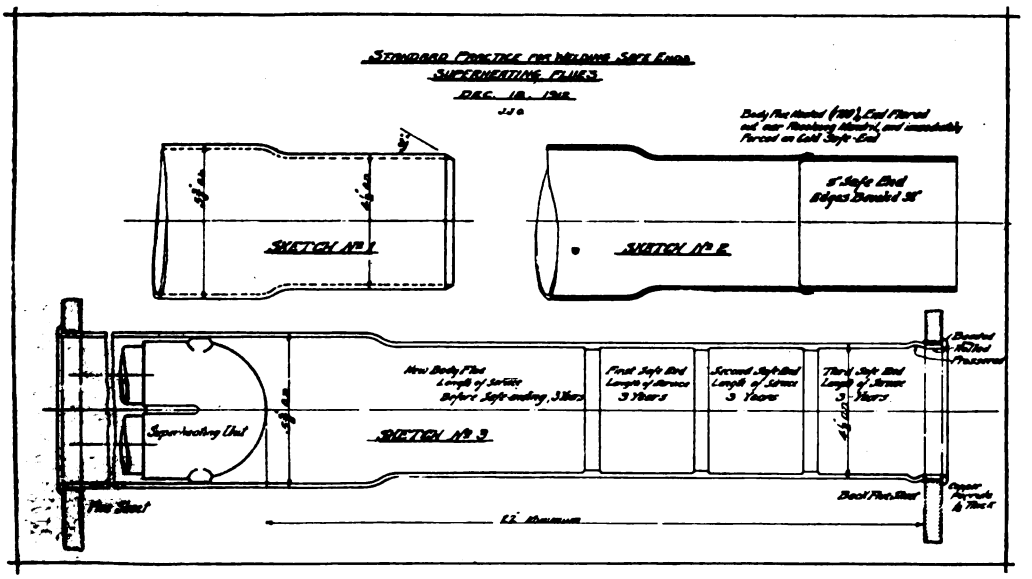
Poor and careless workmanship is also a factor when it comes to making repairs. It is not only necessary to have good workmanship, but to see that the material used in making repairs is not too strong or of the wrong grade, which would result in uneven expansion and contraction, liable to work great injury. In the opinion of the committee "bad water is probably the chief cause of corrosions, pitting and grooving." These destructive agencies very much weaken the shell, and if permitted to continue will ultimately lead to an unsafe condition.

The conclusion of the committee is really summed up in its declaration that "bad management is the chief source of boilers getting into weak and unsafe condition. All troubles can be discovered before the danger line is reached by careful, painstaking and competent examinations." The committee lays down the general rule that "when any defect is discovered that may mean damage, immediately allow the boiler to cool down, then make the necessary repairs."

The committee which was appointed to investigate the question of "Proper Inspection of a Boiler while in Service" reported that after a thorough discussion of the subject it was agreed, in view of the fact that this matter is being studied by a committee representing the various railroads of the country that the subject be held over for the following year in order that the combined results of both studies be presented.

"Is There Any Limit to the Length of a Tube in a Boiler Without a Support Midway of the Boiler, etc?"

THIS interesting and important question, which was entrusted to a committee for study and report thereon, brought forth a most interesting report. The committee finds that "thus far the flue 24 feet in length seems to have been the maximum length reached. Such flues have measured 2¼ inches outside diameter. Twenty-two feet seems to be the maximum length for the 2 inch outside diameter flue." The committee reports that it has not been able to secure any data which would indicate the necessity for intermediate supports for flues of the maximum length of the above. The general opinion seems to be that for flues of this length made of 1-16 or ⅛-inch material the necessity of a support is eliminated because of the buoyancy of the water. The committee finds that "a very good rule deduced from tests and experience tends to show that so long as the length of the flue does not



Digitized by Google

exceed 110 diameters outside measurement, very satisfactory results are assured, and no attempt is made to hazard the statement that flues in excess of 120 diameters will not produce increased capacity and efficiency, because such might be disproven."

The difficulty with a midway support of the flues first of all concerns the installation of the tubes or of the midway support, which cannot be easily reached. After the boiler is put into service a deposit of sediment and scale forms on the flue around the support. In order to remove the flue it is necessary to strip this deposit from it. This is a difficult and tedious task in view of the remoteness of the deposit and the inability to get at it. In order to minimize this difficulty, split sleeves have been used, but they apparently have contributed very little. With flues of the length now used the buoyancy of the water, as has been said, supports the flues when the engine is in service. When, however, the boiler is empty and the engine is moved, this support is lacking and the vibration and lack of support may cause serious damage.

With reference to the question of the intermediate supports, the committee's conclusion is that "while there is no doubt but that the support holds the flue when put in place, the removal of the flue for repairs has proven such a difficult as well as expensive task that the scheme, while plausible, remains undetermined."

Concerning the question of a further lengthening of flues, and the probable necessity arising therefrom for intermediate supports, the committee called attention to the experiments conducted by Professor Goss in 1912, which showed that about 77 per cent of the water evaporated per square foot of heating surface occurs in the fire box or the first four inches of flue length. Dividing the flues from this point forward into four parts of equal length he found that in the first section (beginning at a point four inches from the box) a little over 22 per cent of the water evaporated; in the second, about 12 per cent, in the third about 7 per cent, in the fourth and last section, about 4 per cent. From this experiment the committee concluded that it is doubtful whether any material increase in the length of flues is economically desirable, both because of the mechanical difficulties of their installation and support, the increased friction of the gases through the use of longer lengths and the small amount of additional steaming capacity which the longer flue would contribute.

The Advantages and Disadvantages of using Oxy-Acetylene and Electric Welding Process for Boiler Maintenance and Repairs.

THE committee appointed to consider this subject reported that it had received reports from all of the members of the Association which were on file with the secretary. After reviewing the development of both processes of welding, the report of the committee states that the chairman personally visited many of the railroad shops throughout the country in which these methods were employed, and that he found that those connected with this work, from the boilermaker foreman to the superintendent of motive power, very enthusiastic about both processes. In addition to the use of these processes in connection with boiler work he found that they were being used in car departments in reclaiming steel castings, repairing and cutting steel cars and cutting off steel rivet heads.

As regards the use of these processes in connection with locomotive maintenance work, the chairman found that one or both methods were being successfully employed in connection with cracked and broken cylinders, steel driving boxes and cracked castings, worn castings, worn, cracked and broken frames, and welding material on flat spots in driving wheel tires. In addition to this work one or both processes are used in welding up cracked flue sheets, patching top flanges of flue sheets, side sheets and three-quarter door sheets, repairing broken mud rings, pittings in shells and flues and throughout the boiler generally. The investigation of the committee leads it to believe that it is impossible to weld up vertical cracks and guarantee results at ordinary times. However, the report states that such rapid progress is being made in the development of this work that the success of such operations is to be expected at any time.

With reference to the use of the electric process, the committee reports that while it is not as fast, it does very good welding on fire box sheets and a great many other places. With it you are not able to do the cutting possible with the oxy-acetylene process, and with the electric welder the operator must be placed behind a screen. The electric process is hard on the eyes, and is more difficult to handle because the operator must constantly hold a screen with one hand for the protection of his sight and of his hand.

Best Methods of Welding Superheating Tubes and Tools Used for Same.

THE committee appointed to consider this question presented a lengthy report summing up the results of its own observations and of the reports submitted to it by the members of the Association. The committee finds that at the present time the answer to this question is largely speculative as the welding of superheating tubes is as yet in the experimental stage. The reports submitted show a wide range of opinion concerning every matter covered, and it is difficult, if not impossible, to formulate any general conclusions. It is the opinion of the committee that all safe ending should be done at the firebox end, because this is the location at which extreme heat is encountered, and unusual stresses result. The committee is of the opinion that to cut the burs off the end of the flues and use the body of the flue in the firebox end for a bead would not lead to satisfactory results. From the testimony submitted it is indisputable that it is absolutely necessary to keep the flues tight at all times, and this requires considerable work, and can only be done where the very best material has been used, and the flues kept absolutely clean. In discussing the recommended methods of safe ending the flues the committee states that "to apply the safe end at the firebox end, at all times, it will be necessary to cut your flue as close to the front flue sheet as possible to avoid any additional waste of the body flue, and reduce the necessity of applying long safe ends." The average life of a body flue of this dimension, in this particular service, would not exceed four safe endings. The majority of flue welding machines are built so they can weld a safe end 14½ inches long. This can be

Digitized by Google

done by first welding on a 5-inch piece, second an 8-inch piece, third an 11-inch piece and fourth a 14-inch piece. "At the expiration of this time unquestionably the body flue will be about worn out. To do this it will be necessary to cut your flue close to the front flue sheet, as well as close to the old weld in the back end. In repairing your flue in this manner you will always have a new safe end at all the firebox ends, as well as a flue with only one weld at any time. This will give an almost perfect flue in the locality where it is required to do the greater part of the work; also, where it needs all the strength and durability it is possible to have at all times." The accompanying cut shows the recommended practice of welding safe ends in superheating flues.

With reference to the question of the relative merits of welding machines for this work the committee states that after taking into consideration the questions which are as yet unsettled, it is impossible to make a complete report at the present time which would do justice to the machines now used for this work. The committee requested that this subject be carried over for consideration at the next convention, and that a committee be created to study the question in the meantime. The committee also decided to have the question as to whether flues should be annealed at the firebox end at all times asigned for study by this committeee.

Effect of Superheaters on the Life of Fireboxes and Flues.

THE committee appointed to consider this subject submitted a very brief report, in which it stated that it was unable to "find any well founded claim to show that superheating of steam has a detrimental effect upon the fireboxes or flues, but, to the contrary, it is shown that the life of the fireboxes and flues is prolonged considerably, from the fact that where steam is superheated the working pressure is reduced. However, there are many large engines carrying 200 pounds working pressure with superheaters that show no ill effect on fireboxes or flues."

"Best Form of Grate to be Used with Reference to Removing Fire at Terminals."

THE committee appointed to consider the subject of the "best form of grate to be used to insure removing of fire at terminal with least abuse of firebox and flues, insuring most economical as well as high efficiency" reported that it had seen no form of grate which would give the results possible through the use of the rocking finger grate. Investigation of the committee showed that this grate had given satisfactory service both in the use of bituminous coal, anthracite coal and lignite. Oil burning engines, of course, do not need such a grate. The committee reports incidentally that oil burners cause leaky stay bolts, crown bolts, flues and flanges, although a considerable portion of this difference must be ascribed to the character of the water encountered in the oil burning territory.

Mr. F. D. Timms, of the committee, in a postscript, states that "My experience has been that for efficiency and economy, and also speed in cleaning and dumping the fire with least abuse to firebox and flues, the finger rocker grates (fingers six inches in length), with the dump grates at rear of firebox, are the best. My preference for them is because a good, steady fire can be kept while the engine is in service without continued shaking of the grates, thereby utilizing fuel that would otherwise go into the ash pan.

"In cleaning or dumping the fire the fingers will crush the clinkers, at the same time forcing them into the ash pan with speed, according to the energy of the man using the shaker bar."

"What Benefit Has Been Derived from Treating Water for Locomotives Chemically?"

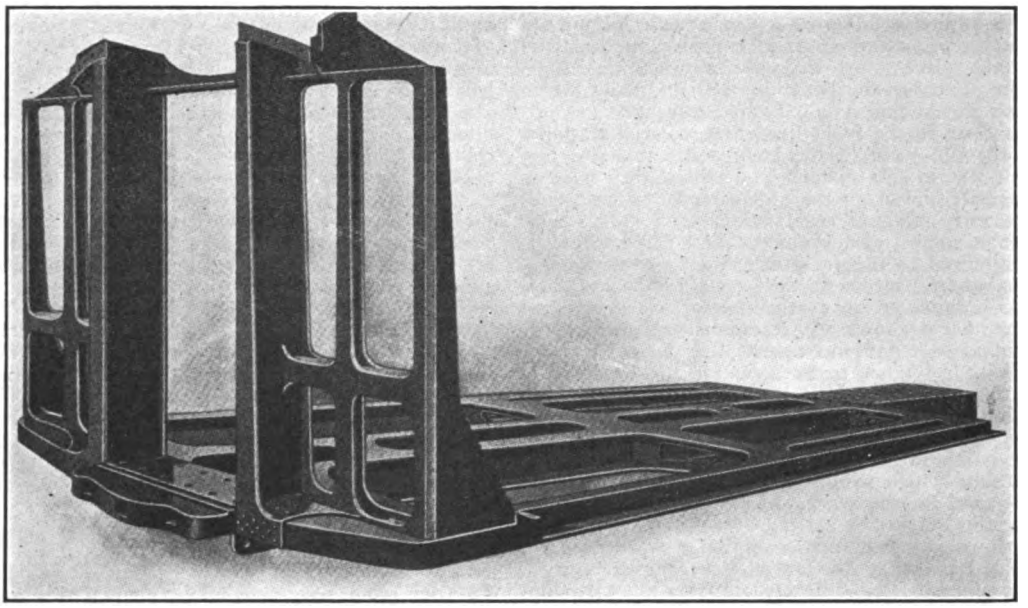
THE report of the committee upon this subject consists almost entirely of a series of questions and answers thereto. Summarizing the results of the committee's investigation we find that the practice of treating feed water is not general, but is confined largely to those places where water conditions are very bad. The usual treatment consists of making a solution of soda ash and lime, the relative proportions being determined according to local conditions. The reports indicate that such a mixture gives good results, it being the consensus of opinion that it reduces the formation of scale and foaming. There is a difference of opinion, however, as to whether it prevents corrosion. Moreover, the investigation shows that with the use of chemically treated water the mileage between washouts is much increased, and that the life of the flues and fire boxes has been lengthened from 150 to 500 per cent, resulting, of course, in a material decrease in maintenance and running expenses. The reduction of incrustation has also brought about the reduction in fuel consumption.

Against these advantages the soda ash treatment is reported in certain cases to have led to trouble and damage to injectors, discharge pipes and check valves, and to require increased lubrication. As regards the cost of treating the water, the Santa Fe reports a cost of four cents per thousand gallons, and the Canadian Pacific an expense of from two to five cents, according to conditions. The figures concerning the cost from other roads were not deemed by the committee to be sufficiently detailed to warrant presentation.

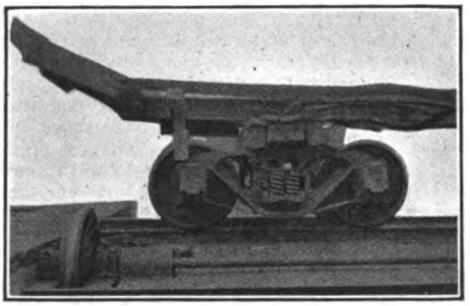
CAST STEEL BODY BOLSTERS, PLATFORMS AND END FRAMES FOR STEEL CARS

THE railway session of the American Society of Mechanical Engineers, recently held in New York City, was devoted in part to the presentation and discussion of a paper by Mr. C. T. Westlake, on "Cast Steel Double Body Bolsters, Platforms and End Frames for Steel Cars." Mr. Westlake pointed out that as recently as 1893 cast steel was comparatively unknown in car construction. Gradually it was introduced first for truck bolsters, later for body bolsters or transoms for freight cars, and next into the construction of passenger cars. Step by step end sills, buffing sills, longitudinal members and other parts were cast and gave a good account of themselves in practice. Finally, these parts, together with many

Digitized by Google



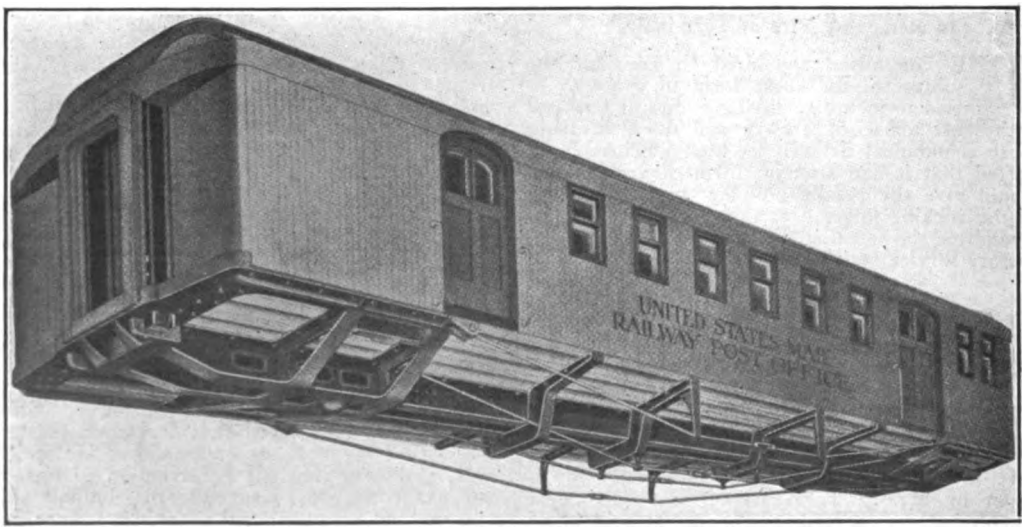
CAST STEEL END-FRAME FOR BLIND END CARS.



EFFECT OF WRECK ON CAST STEEL PLATFORM.

others, were combined into a few simple members, each made up of several castings under earlier conditions. At the present time it is only necessary for the car builder to connect them by center girders and to apply draft and buffing gears and he has a complete car frame.

It was pointed out that the ideal under frame should have all connecting members in the same plane so as to avoid buckling due to excessive loading; and to offer the maximum resistance to shocks. The present ideal in cast steel construction, as is shown by the accompanying cuts, is to so arrange the parts of the longitudinal members, particularly those supporting the platform so that when loaded to destruction by a collision the end portions yield upwardly, thus fold-



CAST STEEL UNDER FRAME.

Digitized by Google

ing the exposed portion of the platform up against the end of the car body and forming an addition to the end frame to assist in distributing the force to all the longitudinal members of the superstructure.

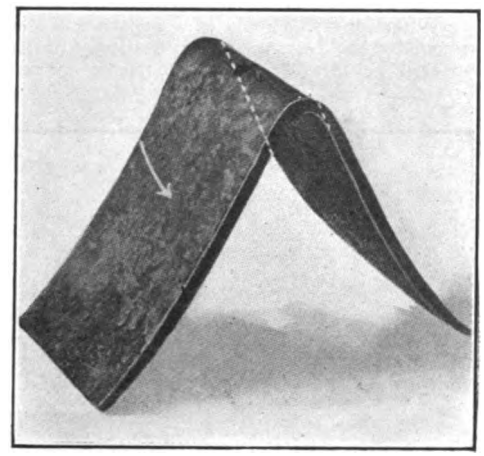
In car construction, cast steel stands pre-eminent as the best material for reducing to the minimum the weight and number of parts while maintaining requisite strength and other essential properties; its popularity in use will proportionately increase as its benefits and advantages are more fully demonstrated.

TEST FOR VANADIUM SPRINGS

SOME very interesting tests have recently been made to determine the lasting qualities of chrome-vanadium springs. The Railway Steel Spring Company has recently completed a test of its type "D" spring, of the semi-elliptic type, with 36-inch centers, and composed of seven leaves 4 x ⅜ inches. This test showed that the upper and lower test limits were respectively 171,400 pounds and 58,600 pounds fiber stress per square inch. A life test showed that the spring withstood 21,923 vibrations before failure (which occurred at the back plate close to the band). After this first failure the test continued. The second break occurred after 22,494 vibrations, the break occurring midway in the third plate.

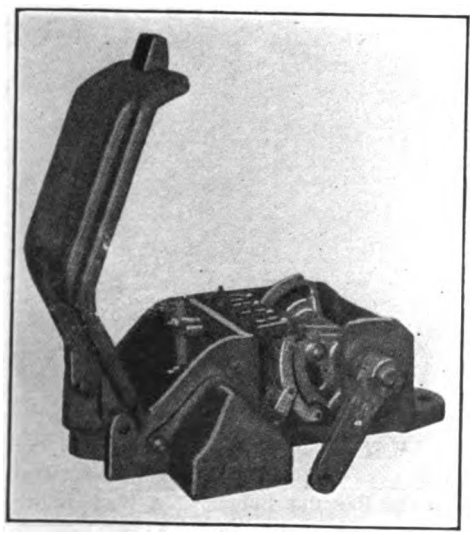
At a test held at the McKees Rocks works of the Crucible Steel Company of America to determine the elastic limit of chrome-vanadium steel, a fiber stress of 256,000 pounds per square inch as the elastic limit was obtained. This, it is believed, constitutes a record for locomotive spring steel.

The elastic limit of carbon, oil tempered, and chrome-nickel springs, tempered, are respectively about 101,000 and 134,500 pounds per square inch. From this it will be seen that the chrome-vanadium spring has two and one half times higher elastic limit than the best of any other type. The tests were made upon leaves taken at random from a large number of locomotive springs being manufactured, and were made in the usual course of inspection. The degree to which the chrome-vanadium leaves withstood the strain is shown by the accompanying illustration. All the leaves bent at an angle of more than ninety degrees before breaking, while the best performance vanadium leaves showed a bend to an angle of 117 degrees.



REMARKABLE COLD-BENDING TEST OF LEAF FROM A VANADIUM LOCOMOTIVE SPRING

NEW SIGNALLING APPARATUS



UNIVERSAL SWITCH CIRCUIT CONTROLLER.

THE Union Switch & Signal Company has recently produced a new modification of the universal circuit comptroller, which this company has had on the market for several years. The general appearance of the new type is shown in the accompanying cut.

The new type makes possible a better method of adjustment, insuring greater accuracy and permanence. Each cam arm carries a pinion which meshes into a rack cut on the inner face of the slot in the quadrant, thus affording a micrometer adjustment. As in the former design the contacts are "interlocked" by the quadrants, so that when any quadrant is in a position corresponding to that of the outer one as shown in the accompanying cut, its contacts cannot be moved in either direction.

Instruments of this type are furnished with contacts operating in two or three positions, as may be desired. The former are suitable for shunting the track and opening signal circuits in automatic block signal installations; the latter for selecting circuits used chiefly at interlocking plants.

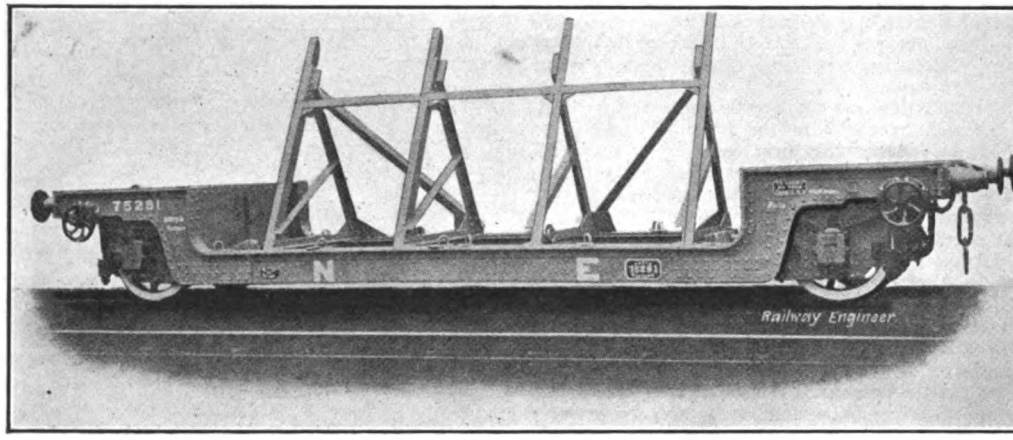
UNIQUE FOREIGN CAR FOR HANDLING STEEL PLATES

THE increasing size of castings, boiler and armor plates and other heavy freight of the same general character is one of the serious problems confronting the traffic and operating departments of railways the world over. It is now generally recognized that the railroads will be forced to provide special equipment for many of these classes of traffic. In line with this new development in the field of transportation the accompanying illustration of the new twenty-ton four-wheel plate wagon recently constructed by the North Eastern Railway of England will be interesting to American operating officials.

Of course, the carrying capacity of the car is very small as contrasted with American standards, but not disproportionately so when compared with that of the ordinary English freight car. The interesting features are the goose-neck framework of the car bringing the floor thereof, very much closer to the rail than would be ordinarily possible. In addition the permanent trestle is a most interesting feature, making for lower loading coasts and greater security in transit. The "well" or carrying floor will take a plate 19 feet long and 13 feet 3 inches within the load gauge. This large width was the real purpose sought after in the construction of the car.



TWENTY TON FOUR-WHEEL PLATE WAGON, WITH FIXED TRESTLES; NORTHEASTERN RAILWAY, ENGLAND.

NEW TYPE OF RAIL JOINT FOR LIFT BRIDGES

A NEW type of rail joint for bascule bridges has been in successful operation for over a year on the bridge of the Chicago and Western Indiana Railroad over the Calumet River near South Chicago, Ill. The new design was worked out after vexatious experience with older types of rail joints, such as the sliding block, the sliding bar or the mitered type of joint. While these joints work successfully with short span swing bridges where the expansion does not protect a wide space between the abutting rail sections, and with lift bridges of moderate length, yet when they are applied to larger structures they bring with them serious objections.

The general character of the new type of rail joint is shown in the accompanying illustration. The new joints are made of cast manganese steel, and are of the mitered type, the point of the miter being arranged to trail in the direction of the traffic on the gauge side of the rails. The castings comprising the movable section of the track have guiding members cast on the under side which enter a pocket on the stationary section when the bridge is closed. These guiding members are tapered at the lower end, being used to end stationary section pockets when the bridge is closed, thus bringing the movable rail section to a close alignment regardless of the alignment of the bridge.

In order to reduce the effects of wear, the surface of the metal between the tread and the guard rail sections is raised and provided with inclined approaches. The same is true of the guard rails at the point of junction.

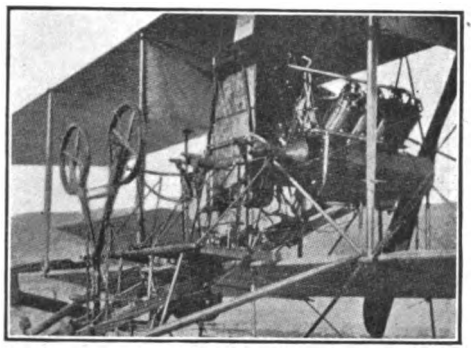
SCIENTIFIC APPLICATION OF THE GYROSCOPE

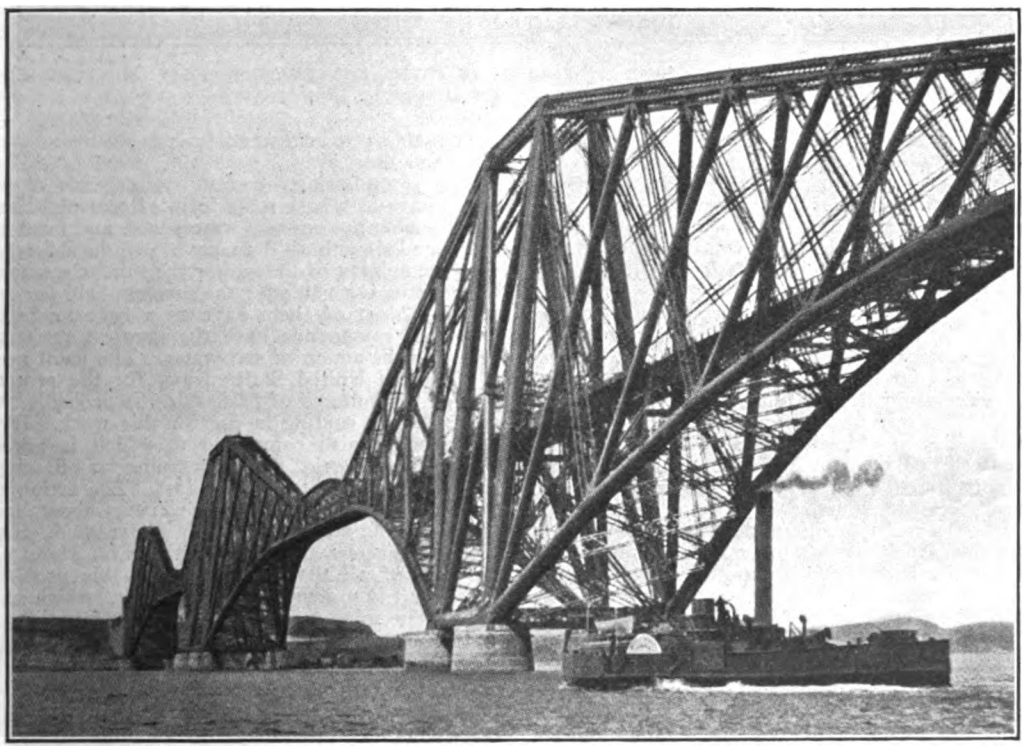
THE May issue of the *Journal* of the Franklin Institute contains a very interesting and timely article on "Scientific Application of the Gyroscope," written by Elmer A. Sperry. This peculiar device, whose action is so mysterious to the ordinary individual, has been applied extensively in connection with many forms of enterprise, it being used for stabilizing seagoing vessels, especially men of war, in the construction of compasses, in experimental installations of monorail trains, and finally in connection with aeroplanes. The accompanying illustration shows the installation of this device with an aeroplane. It is used, in brief, for the purpose of preserving an even keel, and preventing the flier from capsizing in gusty winds. The device is both automatic and capable of regulation by the operator at pleasure.



AEROPLANE SHOWING INSTALLATION OF STABILIZERS.

PROTECTING STEEL FROM CORROSION

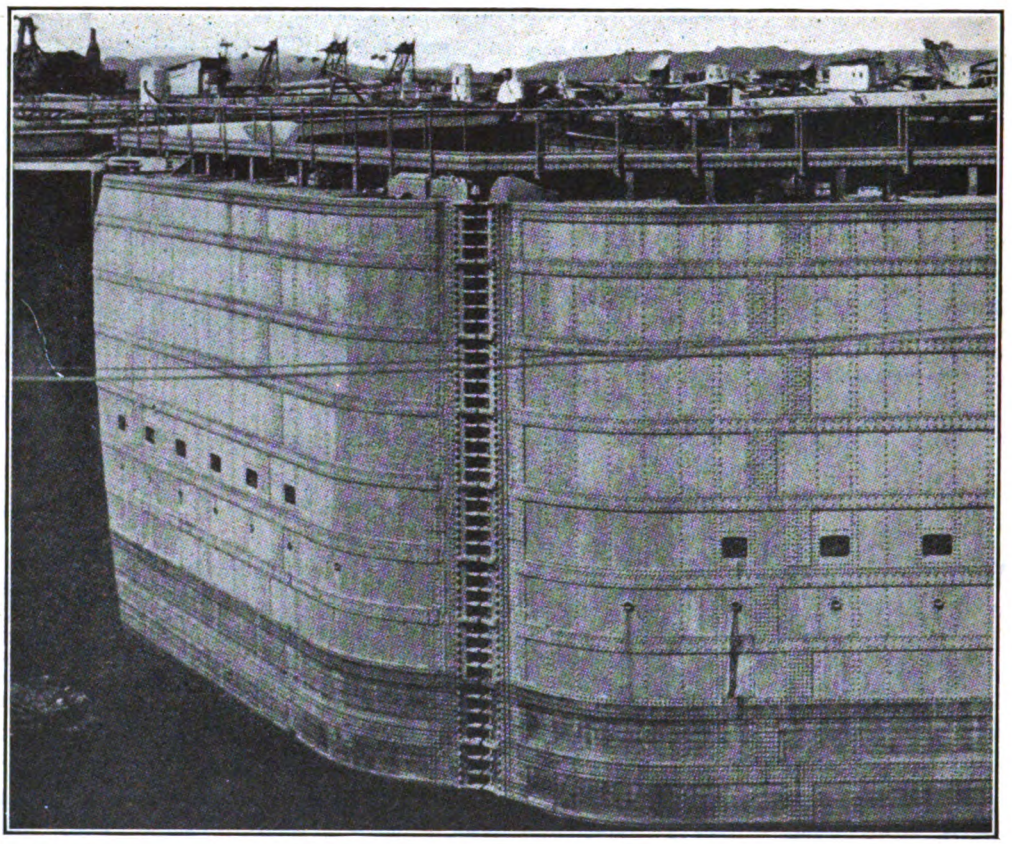
MR. HENRY WILLIAMS has contributed a most interesting article to the May issue of the *Engineering Magazine* on protecting steel from corrosion. This article will be of interest to maintenance of way engineers and others having to do with the care of railway bridges, bulkheads, etc., located in or near sea water. Mr. Williams reviews briefly the various attempts heretofore made to compound a paint which will withstand the destructive agencies of sea water or air laden with salty moisture. He points out that thus far no one has devised a paint which successfully withstands the disintegrating influences, the result being that it is necessary to continually repaint bridges in order to prevent them from being destroyed within a few years. According to the author, linseed oil paint will not last more than three months under certain conditions, and there are many instances where, despite annual cleaning and painting, the stringers, floor beams and web plates of railroad bridges have been rapidly disintegrated by the



(Copyright by Underwood & Underwood.)

THE GREAT STEEL BRIDGE OVER THE FIRTH OF FORTH; AN EXAMPLE OF BRIDGE CONSTRUCTION LIABLE TO CORROSION.

Digitized by Google



LOCK GATES, PANAMA CANAL. A STRIKING EXAMPLE OF STEEL CONSTRUCTION THAT MUST BE PROTECTED FROM CORROSION UNDER DIFFICULT CONDITIONS.

destructive agency. One of the most difficult problems in bridge maintenance is that connected with the great bridge over the Firth of Forth in Scotland. This bridge is exposed to heavy fogs and salt moisture from the North Sea. To keep it clear of corrosion and painting requires the continual work of a force of no less than forty workmen.

The corrosion problem is also encountered in connection with steel cars. Steel coal cars in particular corrode rapidly, and even the best paints thus far devised last but a short time.

In conclusion, Mr. Williams states that in the light of his own experience there are only three general classes of paint which offer promise for the protection of steel from the corrosive affects of moisture. These are, first, bituminous paints; second, cement paints, and third, varnish paints. The first class, bituminous paint, embraces those pigments which depend upon bitumen and coal tar for the body. These have a widely varying efficiency; many of them having to be melted by heat before application. The great objection is their inability to withstand long exposure to sunlight and open air.

The second class, cement paints, are those which have as a base some form of cement. They are probably not entirely waterproof, and must be compounded with skill to have any durability.

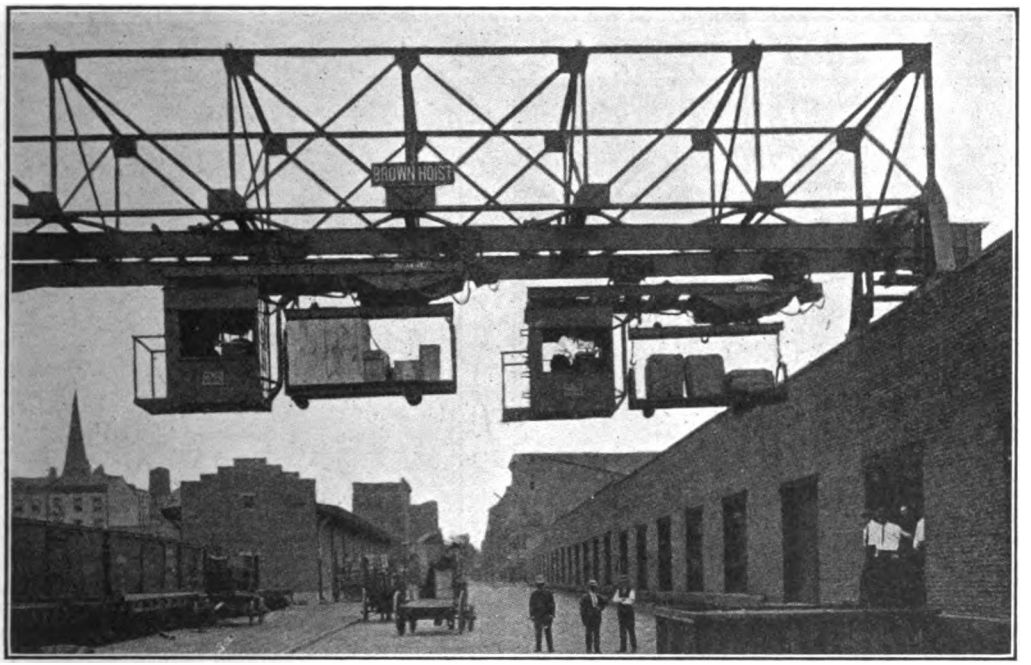
In the opinion of the author the third class, varnish paints, seem to offer the greatest field for research. Most of them have as a base tong oil, and such compounds have the greatest resisting power to the action of salt water. The paint now used by the United States Navy for the protection of the bottoms of battleships, is probably the best resisting coating in use for this work. It is a shellac varnish compound to which is added small percentages of turpentine, pine tar oil, white zinc oxide and metallic zinc dust. The action of the paint and salt water which brings about protection to the steel is not fully understood. The author expresses the hope that careful study on the part of all those interested in this problem may result in a development of a paint which will completely solve this most important question.

NEW HOISTING MACHINES ON NEW YORK DOCKS

AN interesting feature of modern dock equipment is illustrated by the recent installation of "Brownhoist" rapid freight handling machinery by the New York Dock Company at its docks at the foot of Baltic Street, Brooklyn, N. Y. The conveyers are intended to move freight to and from lighters, wagons, warehouses, freight-houses, railroad cars and delivery trucks.

The present installation, which is shown in the

Digitized by Google



DOUBLE-TRACK FREIGHT CONVEYOR, NEW YORK DOCK COMPANY.

accompanying illustration, has been erected in connection with warehouse No. 117, which is used for sorting and storing the export and import freight. The machine consists of a single runway bridge on the wharf, a double runway bridge over the railroad yard and two "I" beam tracks through the warehouse, connecting with the outside runway bridges and with the internal system of two man trolleys.

The limiting height of the hoist is 30 feet; the machine has a hoisting speed of 50 feet a minute when fully loaded and 120 feet a minute empty. The traveling speed is 450 feet per minute loaded and 550 feet per minute empty.

The plant, which is not yet running to full capacity, is thus far doing the work formerly requiring twelve men, and in addition is greatly increasing the capacity of the dock.

Interesting Experiments with Train Order Delivering Device.

THE Atchison, Topeka & Santa Fe System is experimenting on several divisions with a new device claimed to be capable of delivering nineteen train orders at the same time at any speed up to 100 miles per hour. The general character of the device is shown in the accompanying illustrations. The device is so constructed that it is possible to deliver train orders, unless at the highest speed, to both the first and second engines of a double header, and to the caboose or the coaches as well. The tests thus far made with the device have shown very encouraging results.

The device, as will be seen, consists of a suitable frame or stand to which is attached the mechanism operating the delivery arms, of which there are three. So rapid is the operation of these arms that they will change positions, one advancing after the other in a circular manner in time to enable the second engine of a double header to pick up a duplicate of the train order which was presented to the first locomotive. In the same way another duplicate is advanced for

Hardwood Tie Plates in Europe.

M. MATTHEI, in a paper read at a recent meeting of the International Railway Congress, gives some very interesting information concerning current practices and results with the use of hardwood tie plates on European railways. We reproduce herewith illustrations showing some of the most generally used types of the plates. Most of these "pads" are made of oak, hornbeam or beech, which in many cases has been pickled. The purpose of the pad is to take the wear and the crushing effects off the rail preventing the destruction of the preserved tie, which in many cases gives service for thirty years or more.

The necessity of hardwood tie plates is peculiarly great in Europe because of the necessity of using soft woods for ties, which crush badly under the direct rail pressure. The use of the plate makes possible the employment of sleepers

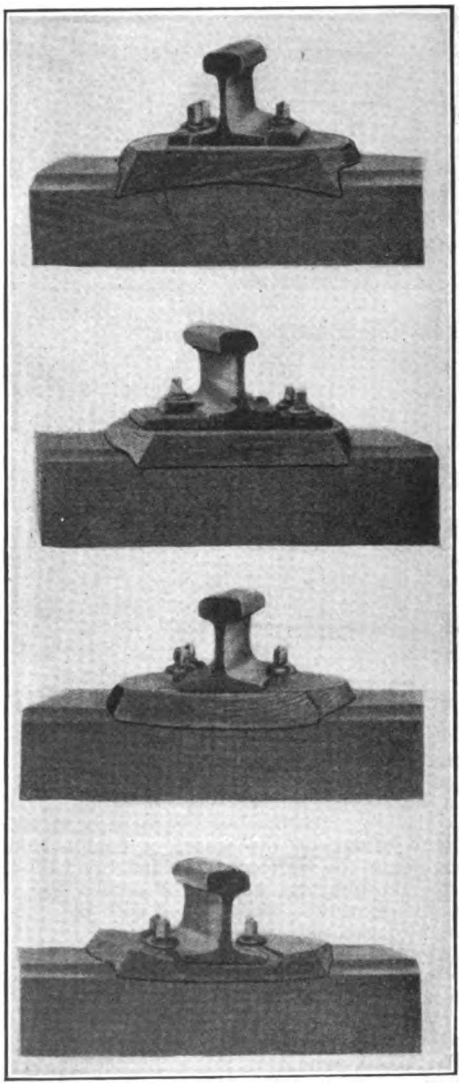

Figure 1.—Wooden tie plate with convex surface, spherical seat and iron bearing.

Figure 2.—Wooden tie plate with horizontal seat and iron bearing.

Figure 3.—Wooden tie plate with concave spherical seat and incline top surface for rail bearing direct.

Figure 4.—Wooden tie plate with concave spherical seat dapped for rail bearing direct.

Digitized by Google

having a smaller cross section, a reduction in maintenance expenses; better insulation of electric conductors in connection with switches and signals and a better track alignment. In most cases screw spikes are used.

The hardwood tie plate is really necessary to secure the advantages of longer life coming from chemical treatment of sleepers, and this is the real reason for its general use.

System as Applied to Shop Repairs to Locomotives.

MR. A. K. KENDALL, foreman of the erecting shop of the Canadian Pacific Railroad at Montreal, read an interesting paper at the April meeting of the Canadian Railway Club on "System as Applied to Shop Repairs to Locomotives." He pointed out that the efficiency of repair shops depended directly upon the regularity with which the locomotives came into the shops. If the equipment is shopped spasmodically, say 5 per cent one month and 20 per cent the following month, additional cost is bound to result. Economical shop methods depend upon the co-operation of the operating department so that the equipment is shopped in even amounts.

The Canadian Pacific shop has worked out thoroughly the standardization of work, the application of the principles of scientific management to machine operation through the use of time studies, and other scientific methods. Wherever possible a straight piece work system is used as a stimulus to the workman, enabling the efficient workman to increase his earning capacity considerably above his former day rate. This is done without any additional strain upon him, for he is taught how to use his energy in the most economical manner. One of the problems to which much attention has been devoted concerns the apportionment of the compensation on piece work where more than one operator is employed. The end which is sought is to prevent the efficient man from losing because of his less efficient coworker. Much attention has also been given to the routing of work in the shop, testing of machines, and careful inspection.

Air Brake Problems.

THE April meeting of the New England Railroad Club was devoted to the consideration and discussion of a paper presented by Mr. Charles U. Joy, general air brake inspector of the New York, New Haven and Hartford Company. The paper, which was largely descriptive and historical in character, contained some interesting points concerning present practices and probable future developments. Mr. Joy reported that his company had had most excellent results with the use of Westinghouse high brake equipment (Schedule P. C.) in connection with high speed passenger work. Using as a basis of comparison the months of November and December, 1911, and January and February, 1912, his company had been forced to remove 77 pairs of slid-flat wheels. The total passenger car mileage for these months was 25,142,828, which gives an average of 326,530 passenger car miles to one pair of slid-flat wheels removed. Over 50 per cent of the amount were removed from cars using 70 pounds pressure, which hardly supports the general impression that high brake power causes slid-flat wheels.

Concerning the question as to what changes will have to be made in truck design in order to permit of greater break-shoe pressure, which will be necessary in case any large increase is made in the weight of trains, Mr. Joy stated that in his opinion it would be impossible to much increase the brake-shoe pressure without forcing the journals from their bearings. He believed that it would be necessary, when an increase in pressure must be made, through the use of still heavier equipment to apply a clasp brake or one using two shoes per wheel. This would give more bearing surface and eliminate the journal pressure resulting from the brake-shoe load, as at present applied.

In the discussion which followed the presentation of Mr. Joy's paper, Mr. R. D. Smith stated that he had had some experience with the use of clasp brakes on locomotives and found that they were open to the objection that they heated the tires and were very hard on the wheels, which "are showing a great deal of distress."

Selecting Explosives for Engineering Operations.

MESSRS. CLARENCE HALL and Spencer P. Howell, of the Bureau of Mines, Department of the Interior, have prepared a bulletin (No. 48), representing the results of much study and experimentation, on "The Selection of Explosives Used in Engineering and Mining Operations." The report deals exhaustively with the power and range of usefulness of each of the various classes of explosives ordinarily used in blasting operations. The reasons for the difference in the performance of each class is explained both practically and theoretically. What explosives are safe for use in gaseous or dusty tunnels or coal mines; those which can be used for neutralizing poisonous gases in tunnels or mine work; the merits of different classes of electric detonators, and the relative efficiency of each class of explosives when thawed or in a frozen condition, are exhaustively considered. The report will be of great interest and value to civil engineers and others having charge of railroad construction work.

Electrical

The Problem of Steam Railroad Electrification.

THE annual meeting of the American Institute of Electrical Engineers, held on May 20th, was given over largely to the discussion of a paper entitled "Trunk Line Electrification," prepared by Mr. Charles P. Kahler, in which some of the most distinguished men in the field participated.

Mr. Kahler brought out in his paper the facts that the electric locomotive in proportion to its weight could haul heavier loads than its steam

Digitized by Google

rival; that unlike the steam locomotive, which must spend the larger part of its time in the shops, it was capable of giving a very large daily service which, in most cases, is double that performed by the older type; that it was possible to haul a larger tonnage with a smaller number of locomotives and that the economies of operation were considerable. A paper was also read by Mr. H. M. Hobart, of the General Electric Company on 2400-volt railway electrification. This paper consisted largely of a comparison of costs of steam and electric equipment for a hypothetical case of a mountain division 96 miles in length. The cost per one hundred ton miles with steam was given as 18.1 and with electricity as 11.6 cents.

The discussion was in many ways the most valuable feature of the meeting, for it brought out the views held by some of the most prominent engineers in this field. Mr. A. H. Armstrong, of the General Electric Company, contended that the plans for electrification should be made not with regard to present requirements but to those of the future; that if the work is in the end to prove economical it must consider "the traffic of five, ten or even fifty years from the present time."

Mr. F. E. Wynne, of the Westinghouse Electric and Manufacturing Company, took exception to some of the figures contained in the papers which had been presented, contending that the over-all figures given for efficiency between power house and line—namely, 89 per cent for general train service and 78 per cent for express train service—should be decreased from seven to ten per cent.

Mr. E. R. Hill, of Gibbs and Hill, expressed his gratification at the logical manner in which electrifications are being carried out. He stated that his firm had had occasion to figure on a number of mountain grade electrifications and that, in general, the results of the substitution of electricity for steam had been very satisfactory both as regards economy and an increase of speed and reliability of service.

Mr. A. H. Babcock, of the Southern Pacific Railway, in a written communication pointed out that generalizations with reference to trunk line electrification were extremely dangerous; he had found on the Pacific Coast that the savings due to electrification were by no means enormous and would not defray, except after the expiration of many years, the cost of the substitution. Power companies were not prepared to furnish electric current at sufficiently low prices to offer effective competition with fuel oil at the ordinary market rates on the Coast of 70 to 80 cents a barrel. Energy at the rate of five mills per Kw-hr. was prohibitive. He criticised the statements in one of the papers concerning the annual load factor given as sixty per cent as a minimum. Mr. Babcock believes that it would seldom rise above 20 per cent as a matter of fact. He was of the opinion that as a rule the total energy charge could be wiped out of the annual financial statement without making a material difference in the result, so small a part did it play in the total operating cost and in comparison with the fixed charges and other expenses.

In written discussions over the signatures of H. Y. Hall and G. W. Welch the statement was made that an insufficient allowance for first cost and maintenance was made as a rule under Western conditions. They believed that the figures submitted in the papers under discussion were much more favorable than would be found in actual practice.

New Haven Electrification Delayed.

BECAUSE of strikes of electrical workers the completion of the electrification of the portion of the New Haven's line between Stamford and New Haven has been somewhat delayed, with the result that it is not anticipated that regular service will be offered before August 1st. The structural work for the suspension of wires is largely concluded and the wiring is practically complete as far as Norwalk and will soon be finished to Bridgeport.

Additional Details Concerning St. Paul Electrification.

IT is known that both the General Electric and the Westinghouse Electric Companies are preparing estimates on the electrification work to be done of the Puget Sound Division of the Chicago, Milwaukee and St. Paul system. It is believed from the work thus far done that the cost of this electrification will be considerably less than the $8,000,000 originally estimated. It is roughly calculated that the cost will not exceed $8,000 per mile and as there are 450 miles to be electrified the total expenditure will be between $3,600,000 and $4,000,000. These figures include only the electrification work proper and do not include the cost of locomotives or any allowance for generating apparatus. As the power is to be purchased from hydro-electric companies no allowance must be made for the latter item.

Third Rail and Overhead Clearances.

AT the meeting of the American Railway Association held on May 21st, the Committee on Electrical Working submitted a report concerning third rail and overhead clearances. This Committee was composed of some of the most eminent men in the industry. The Committee reported in brief in favor of a minimum clearance of 15 inches from the track gage line, continued horizontally to a point within six inches of the track gage line and two and one-half inches above the track rail. The Committee reported that it intended to take up the various technical questions concerning overhead working conductors with the electrical working committees of the American Railway Engineering Association and the American Electrical Engineering Association. In advance, however, of the final conclusion the Committee desired to make a tentative report in which it was recommended in brief that a distance of 9 feet 11½ inches be allowed for overhead conductors above the top of the car making a clearance of twenty-five feet between the top of track rails and permanent way structures. This minimum applies to those conditions where trainmen are likely to give signals with a lantern; where such is not the case a minimum height of permanent way structure of twenty-four feet is provided for freight work; where no freight is handled, or if so handled in such a way that brakemen will not be required to pass over the tops of cars, a minimum height ranging from 15 to 18 feet is suggested.

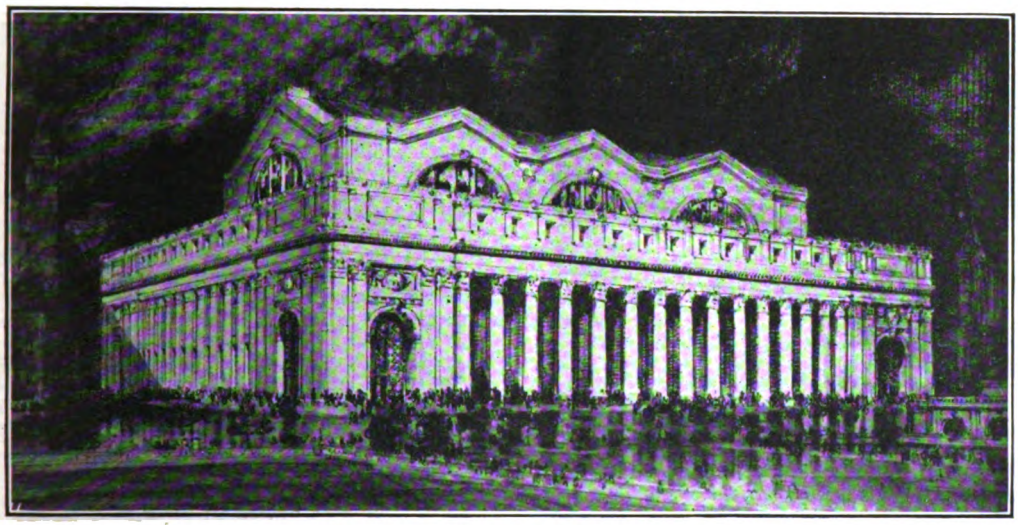
Terminal Facilities

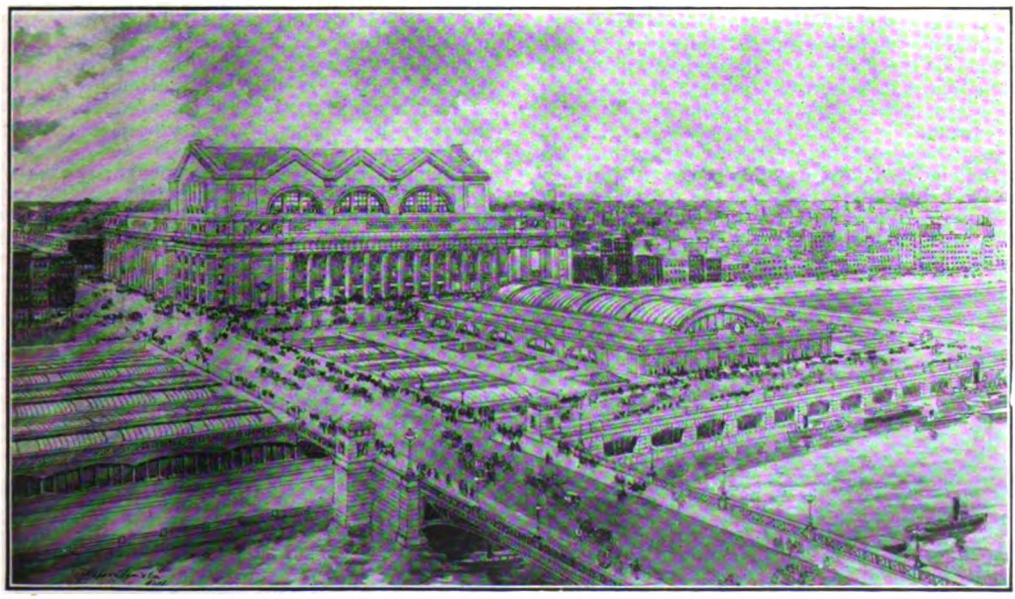
Chicago's New Union Passenger Station.

THE following illustrations present a fair idea of the probable appearance of the new West Side Union Passenger Station the railroads of Chicago contemplate building.

These drawings disclose a structure of two principal parts—the train concourse at the track terminals, to lie on the east side of South Canal Street between West Adams Street and West Jackson boulevard, and the main station building with waiting-rooms, offices and other appurtenances to a modern station, to be on the west side of South Canal Street and extending to South Clinton, also between West Adams and West Jackson. As shown in the illustrations the main building will be a Corinthian-columned structure designed from the old Roman idea embodied in the palatial structure built to house the famous baths of the Imperial City. Within it will be an immense waiting-room with an arched ceiling 180 feet high, lighted with huge windows 100 feet above the floor. About the spacious waiting-room will be such offices as are required to conduct affairs of the terminal, telephone and telegraph stations, other public



PERSPECTIVE OF PROPOSED NEW WEST SIDE UNION PASSENGER STATION AT CHICAGO, VIEW LOOKING NORTHWEST.



GENERAL VIEW OF ENTIRE TERMINAL PLANT.

Digitized by Google

service offices, barber shops, baths and shops where the traveling public may supply itself with the things needed while in transit. Of white American granite, this columned mass with its band of Americanized classic architecture surmounting the columns like a fillet will tower above the surrounding structures for the trains coming and going. In the illustrations is shown a general view of the whole terminal plant, with the south-bound train sheds at the left, West Jackson boulevard in the center, the north-bound tracks and the vaulted concourse to the right and the main station beyond. The Chicago River is in the foreground. The concourse will be a huge structure, 180 feet wide and 250 feet long. Of lower roof than the main building, this part of the plant with its great plaza under cover will be a vaulted building. It also will be constructed of American white granite. The concourse, containing the tracks, as shown in the illustration of the whole plant, will be of the same level as the great waiting-room in the main building, below the street grade, so passage from the waiting-room to train will be made without interruption. The tracks will be twelve feet below the Clinton Street grade, which is the standard for that section. Entrances and exits will honeycomb the containing walls of all the buildings. Neither in the concourse nor in the train sheds to the north will there be pillars, posts or columns.

There will be no confusing and dangerous baggage trucks running along the passenger walks between trains, no incumbering mail wagons. Along the river east of the concourse, as shown, will run a broad boulevard. Streets will be wide and free on all sides of all the buildings, and cab stands will be located conveniently under cover within the main station. Facing the concourse there will be twenty-six train tracks; ten will lead to the north, sixteen to the south. In the lower levels, beneath the track floor, will be elaborate mechanical equipment for handling baggage, mail and express. Baggage for loading will be passed up to the cars on elevators, as will mail. The station will be used by the Chicago, Burlington and Quincy; Chicago, Milwaukee and St. Paul; Chicago and Alton; Pittsburgh, Fort Wayne and Chicago, and Pittsburgh, Cincinnati, Chicago and St. Louis railways. Construction awaits only an enabling ordinance from the city council. The owners, as announced in "The Record-Herald," are ready to begin building at once.

PASSENGER TERMINAL AND OFFICE FACILITIES OF THE CANADIAN PACIFIC RAILWAY AT VANCOUVER, B. C.

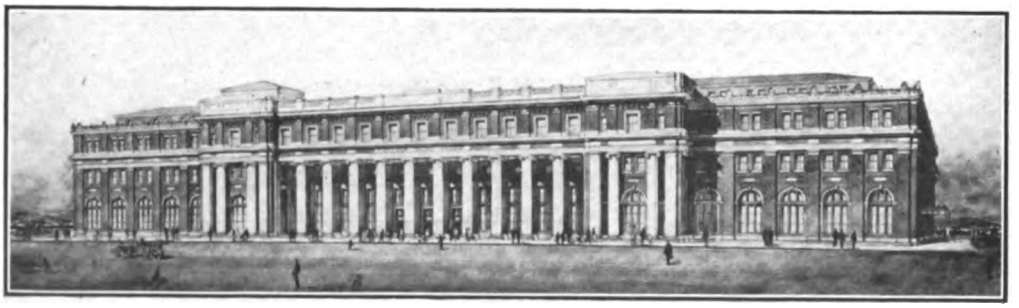
PLANS have been prepared and work is now under way on certain improvements in connection with the Canadian Pacific Railway Company's passenger terminal at Vancouver, B. C.

By reason of its favorable location and the transportation facilities afforded by the enterprise of the Candian Pacific Railway, Vancouver has grown from a trading camp to a well established city with over 125,000 inhabitants in about twenty-five years' time. All business lines are represented in the commercial field centering at the city. The past growth has rendered inadequate the present facilities for handling the terminal business of the Railway Company, and plans have been adopted to relieve the present congestion, as well as to provide for reasonable growth in the near future.

The general scheme embraces a passenger station and office building suitably located on available land immediately east of the present passenger station. There will be four passenger tracks with provision for more when required, separated by wide platforms, between the station and the present freight yard. The passenger tracks are to be raised about five feet above the present track level to reduce the difference in level between the street and the tracks to about twenty-five feet.

In order to avoid an inconvenient grade crossing and delays to traffic between the city and steamship wharf a bridge on the line of Granville street extended, is to pass over the passenger and freight tracks to the steamship pier and connect directly with passenger accommodations on the pier. An incline is also to be built leading from the west side of this bridge to the wharf giving access to the lower deck of the pier and freight sheds, and the water front. Another viaduct over the tracks is to be built on the line of Burrard street extended northerly with an incline giving access to the present Trans Pacific pier and other portions of the water front.

The main entrance of the passenger station will be on Cordova street with the main waiting room located centrally in the station on the street level. Ticket offices serving the several classes of railway and steamship passengers are located at one



NEW PASSENGER TERMINAL OF THE CANADIAN PACIFIC RAILWAY AT VANCOUVER, CANADA.

pose will be obtained from the Civil Service Commission.

The Advisory Committee of the Railroads, which was created at the meeting in New York City, on April 24th, having advised the Interstate Commerce Commission of their desire to co-operate with the Commission, held a meeting on May 16th in New York City, for the purpose of further considering how the railroads could best do the work required of them under the Federal Valuation Act.

A communication was received from the Interstate Commerce Commission advising of its desire to have a conference with the Committee of the railroad companies at Washington, on Tuesday, May 27th, which invitation was accepted by the railroad companies.

Mr. Thomas W. Hulme was elected Secretary of the Committee, of which Mr. Samuel Rea is General Chairman; Mr. L. F. Loree, Chairman of the Eastern Group; Mr. W. W. Finley, Chairman of the Southern Group; and Mr. Hale Holden, Chairman of the Western Group.

Investigating New England Railway Conditions.

UNUSUAL interest was manifested during the month in the testimony of President Mellen, of the New Haven Lines, before the Commission, on the occasion of the investigation of the New England railway situation. President Mellen's statement was frank, vigorous and to the point, and in the main was a strong and satisfactory refutation of the many accusations and criticisms which have been hurled at him since the beginning of the agitation over New England railway affairs. The impression he created was undoubtedly of a most favorable character, and his statements were a revelation of the tremendous responsibilities which have rested upon his shoulders in his aggressive campaign to promote the commercial interests of New England. Mr. Mellen's testimony is referred to more in detail elsewhere.

Jurisdiction Test in Texas.

IT seems probable that there will be another test of jurisdiction between the Texas Railroad Commission and the Interstate Commerce Commission to their respective authorities with respect to the handling of interstate equipment.

The State Commission has issued a circular, which became effective May 2nd, relative to terminal charges at Galveston. Its enforcement means the discontinuance of the absorption of the loading and unloading charges for freight received from or delivered to coastwise vessels to be recognized at Galveston.

The State Appellate Court, in a case wherein the State Commission assessed fines aggregating some $14,000 for violations of the "thirty-minute rule," held that the alleged violations were committed in the operation of passenger trains performing interstate business, and were, therefore, under the jurisdiction of the Interstate Commission.

This decision gave the railroads a first cue to the question of their rights on interstate traffic. It was followed by a ruling of the Interstate Commission to the effect that freight having interior destination, even though it was billed to Galveston and rebilled from there, was interstate business.

The State Commission has previously claimed jurisdiction, but was not sustained in the adjudication which followed. Railroad traffic officers anticipate resistance from the State Commission, but feel confident of their position under the decision.

Commission Refuses to Interfere with Passenger Association.

CHAIRMAN MAYFIELD, of the Texas Railroad Commission, and Commissioner Watson, of the Oklahoma Commission, recently addressed letters to the Interstate Commerce Commission, asking an investigation of the action of the Southwestern Passenger Association of St. Louis in refusing a special rate of one cent a mile on account of the Confederate Veterans' Reunion to be held at Chattanooga. The railways announced a rate of two cents a mile. Commissioner Clements replied that the Commission felt it "could hardly with propriety, undertake to influence the carriers to make lower rates in any instance than they could lawfully be required to do; for, while the carriers may, under the law, as they often do, establish special fares for attendance on conventions, reunions, etc., we did not feel justified in urging them to do so, for the reason that it is our duty to pass upon the question of reasonableness of rates, fares and practices of the carriers and the lawfulness thereof."

Chicago Packers Demand Rate Reductions.

A PROCEEDING of importance to the large Chicago stockyards firms, has been begun before the Interstate Commerce Commission by Swift & Co., which is seeking to obtain a reduction in freight rates on fresh meat and packing-house products from St. Paul to Chicago. As the so-called St. Paul rates have been related in the making of rate schedules from Omaha, Kansas City, St. Joseph, Mo.; Sioux City, Wichita, Oklahoma City and Fort Worth, Texas, it is expected the ruling of the Commission in this case will have an important bearing on prospective changes in the rates to Chicago from the other cities.

Recently George A. Hormel & Co., of Austin, Minn., filed a petition with the Commission in which it was alleged that the rate in force of 20 cents a hundred pounds on fresh meat and packing-house products from Austin to Chicago was unreasonable.

It was contended that prior to the enforcement of the latter rate the railroads collected a charge of 15 7-10 cents a hundredweight on packing-house products and 17 cents a hundred pounds on fresh meat between the two points. After much evidence had been introduced, the Commission directed that the rates be reduced to 18½ cents on fresh meat and 16½ cents on packing-house products.

The existing rate from St. Paul to Chicago is 20 cents a hundredweight for both fresh meat and packing-house products and the petition filed by Swift & Co., contains a request that it be reduced to the same level as the Austin rates. If this step is not taken, it is asserted, the position occupied by St. Paul as a meat packing center will be menaced. Seven railroads are defendants.

Preliminary Abstract for 1912.

BECAUSE of extraordinary demands upon the printing appropriation of the Interstate Commerce Commission, the publication of a Preliminary Abstract of Statistics of Common Carriers for the year ended June 30, 1912, has been greatly delayed, and, for the same reason, it has become impracticable for the Commission to distribute this abstract as in the past. Under the circumstances, arrangements have been made by which copies of the abstract may soon be obtained for 30 cents each from the Superintendent of Documents, Government Printing Office, Washington, D. C. It is important that any copies wanted be ordered at once from the Superintendent of Documents, as only a limited issue will be printed and the type distributed at an early date.

The abstract for 1911 (55 pages) presented extensive statistics from the reports of steam roads having operating revenues in excess of $10,000,000 for the year, comprising numerous items showing mileage, revenues, expenses, operating statistics, and equipment, as well as balance sheet, income account, and profit and loss account, and also certain figures from the reports of the principal express companies and the Pullman Company.

The 1912 preliminary abstract (171 pages) is similar to that of 1911, but its scope has been expanded to embrace about three times as many roads, including all having operating revenues in excess of $1,000,000 and it additionally includes returns of their freight traffic movement.

Private Freight Cars.

OWNERS of private freight cars throughout the country are preparing to present elaborate arguments to the Interstate Commerce Commission for the purpose of showing that they are not properly compensated by the railroads for the use of their equipment and that increases in the present tariffs should be made. The first of a series of hearings on the subject will be held under the auspices of the Commission within a short time and evidence will be introduced by a number of firms owning private rolling stock. Compensation for use of private freight cars is fixed on a mileage basis and the returns to the owners during the past few years, it is said, have not been sufficient to pay for interest on the investment, repairs and taxes. The private car owners will be opposed by the railroads, representatives of which will endeavor to show that the existing rate of pay is adequate.

Charge for Tariffs.

THE Commission has decided that the railroads may charge for copies of their freight tariffs other than those which they are required by law and the Commission's regulations to furnish for public consultation. The charges, however, must not exceed the cost of paper and presswork for running off the extra copies and price lists must be filed with the Commission. Tariffs will be furnished first to subscribers, but the railroads will not be required to print more than a limited number of copies for the contingent demand.

Recent Decisions.

A decision has been entered by the Commission in the case involving the suspension of new rules of the Rock Island and other railroads in the Central West governing the allowance for stoves and lining of cars used in transporting potatoes. The Commission held the opinion that when perishable fruit moves regularly and in sufficient volume to justify it, special provision for protecting that traffic from freezing should be furnished.

The Commission in its decision requested a full conference between the carriers and the shippers regarding the methods to be adopted for handling the traffic during the coming year, and asserts that if the matter is approached in the proper spirit, there should be no difficulty in arriving at an understanding. It also asserts that in case of failure of the parties to reach an agreement, the matter may again be called to the Commission's attention.

In the case involving iron shipments from Wisconsin to Chicago dealers, over the Soo Line, the Commission holds, in effect, that if a carrier has not terminal facilities of its own and if it cannot afford to pay for terminal services rendered by other carriers it should retire from competitive traffic. The case involved an increase in terminal charges by the Grand Trunk, which increase the Soo Line attempted to assess on the shipper. In referring to the Soo Line, the decision says:

"If it cannot afford to pay for the terminal services which other and competing carriers provide, it will doubtless have to retire from competitive traffic. It may not either by itself or in conjunction with other carriers maintain unreasonable or unjust discriminatory charges. It is of no interest to the shipper or consignee, nor, so far as appears, to the Commission, whether the Soo Line pays the Grand Trunk $3 per car or $6 per car for the delivery service.

"These carriers are at liberty to arrange between themselves for deviations from the general rules applicable in this district; but they may not, because of changed arrangements among themselves, pass along to their patrons increased charges unless the reasonableness of same is made clear."

A decision has been handed down by the Commission in which it holds that rail carriers may not properly advance charges to ocean carriers on import traffic, except where the property is billed through from point of origin to its ultimate destination, and such through billing separates the liability of the inland carrier or carriers from the liability of the ocean carrier, and shows the tariff rate of the inland carrier or carriers. Such charges of water carriers may not be advanced by railroad carriers subject to the act in cases where property moves under a separate contract of transportation from the port of entry to the final destination.

The Commission has awarded reparation in the case of the Pacific Creamery Company against the Southern Pacific and other carriers, and has held to be unreasonable the rate of $3.50 per hundred pounds on paper labels in less carloads via rail and water from New York City to Creamery, Ariz. The roads were ordered not to change after July 1st rates on this commod-

Digitized by Google

ity that are any higher than the rates on paper wrappers or printed wrapping paper.

In the matter of advances in class rates from certain points in Pennsylvania and New York to St. Paul, the Commission has decided that they are not justified. The carriers' contention that they are relieved of the burden of proof, because of the proposed rates, while advances over those now in effect, are on a lower level than those in effect on January 1, 1910, is not sustained. The carriers are ordered to put into effect by June 1st the lake and rail class rates in effect May 28, 1912.

The Commission has also decided that advances in rail-and-lake rates from Central Freight Association territory to the Northwest through Lake Superior. ports have, upon investigation, been found not justified and the rates in effect prior to June 24, 1912, are ordered restored by June 1st next, and to remain in effect for a period of two years.

It also holds that advances in lake-and-rail class rates from points in the Trunk Line territory to the Northwest and Lake Superior points, are not justified.

In a case unique in the history of the Commission, it has been decided that a tunnel 1,500 feet long, wholly within the State limits of Kentucky, made the traffic via the Baltimore & Ohio from Huntingdon, W. Va., to points on the Norfolk & Western in the same State, interstate traffic, although only the tunnel is without the West Virginia limits.

The Commission also held that the freight rates on steel rails and like commodities shipped by that route were unreasonable and reduced them.

The Commission has dismissed the complaint of the Scott Paper Company against the Pennsylvania and other railroads. The Commission held to be reasonable the rates on toilet paper from Philadelphia, Pa., to points in Central Freight Association territory, and not to be discriminatory as compared with rates from Albany, N. Y.

Readjustment of freight rates on coal from mines in Wyoming to destinations through the Middle West and Northwest, have been directed by the Commission in decisions of several cases brought by the Sheridan (Wyo.) Chamber of Commerce against the Burlington and other Western and Northwestern roads.

Commissioner Meyer, who prepared the opinion, suggested a scheme of rate readjustment, providing for certain reductions and equalizing differentials. This scheme the railroads are directed to carry out. If they do not, the Commission will issue a positive order on the subject.

Proposed advances in all rail and rail-and-water rates on ground iron ore from points in Alabama, Georgia and Tennessee to Boston, New York, Philadelphia and other north Atlantic ports, over railroads operating in this section, were held not to be justified by the Commission. The Commission, however, allowed the roads to withdraw commodity rates on these shipments, leaving in effect a slightly higher rate. The proposed advances would have increased rates approximately sixty per cent.

The Commission has permitted certain railroads to cancel joint rates on lumber from points on the Gulf and Ship Island, and the New Orleans, Great Northern railroads in Mississippi via the Illinois Central Railroad to points in Eastern Trunk Line territory, Eastern Canada and New England. It was found that other through routes and joint rates via shorter and more direct lines are provided, and no increased charges to shippers or receivers were involved.

It was said that the direct cause of the cancellation of the through rates was a disagreement among the roads as to the divisions of the rate. While this excuse was here held to be good, the decision of the Commission says: "Ordinarily such disagreements between carriers will not be recognized as justification for withdrawal of joint rates or through routes. Especially is this true if such withdrawal occasions higher charges to shippers and receivers, or deprives them of opportunity to ship via reasonable through routes."

A decision effecting the class rates from New York City water-and-rail to Middleboro, Ky., has been handed down by the Commission. In this case the Commission held that the class rates via Southern Railway from Birmingham, Ala., and other southeastern points and from Mobile, Ala., unjustly discriminate against Middlesboro, and unduly prefer Jellico, Tenn. Furthermore, it was held that the class rates, rail and rail, from New York City and other eastern points, and all-rail from Ohio crossings, to Middlesboro, are unreasonable. In each instance the Commission prescribed a new schedule of rates which the roads were ordered to put in effect by July 15th.

In the case of the Memphis Freight Bureau against the Illinois Central and other railroads, the Commission holds to be unreasonable the rates of 13 cents on logs from Pearson, Mass., to Memphis, Tenn. The Commission held that the rate should not exceed 9.25 cents per hundred pounds. The roads were ordered to put the reduced rate in effect by July 15th, and to pay reparation on previous shipments to the May Bros., of Memphis.

Rate Advances.

The Commission holds that the increases on rates on sand and gravel, from Anchorage, La., to Houston and Beaumont, Tex., and from Kinder, La., to Houston, Tex., to be reasonable on all roads operating in this section.

The Burlington and other railroads have been ordered to withdraw their tariffs proposing advanced rates on furniture in carloads from Burlington, Iowa; Port Washington, Wis., and other points to St. Paul, Minn., and other points and to file other tariffs in conformity with the findings of the Commission. The roads had proposed to advance these rates on furniture, including the general mixture of furniture, church and school furniture, opera seats, chairs and cribs.

The Commission held that a moderate advance in the commodity rates may be justified.

The Northwestern and other railroads have been permitted to put into effect the proposed advances in the rates on flax tow and excelsior from St. Paul to Chicago. Advances in other rates out of St. Paul on this same traffic, however, were disallowed as of May 15th. This would have included advances in rates to Des Moines, Omaha, Kansas City and other points.

Proposed advances in joint rates over the Delaware, Lackawanna & Western on cement from

Digitized by Google

Nazareth, Pa., to Phillipsburg, N. J., were found by the Commission to be justified. These rates were found to be out of harmony with the general plan for cement rates from this section, but the Commision declared it would make no order for the purpose of indirectly influencing intrastate rates by preventing increases in interstate rates.

Rate Suspensions.

The following rate suspensions have been ordered by the Commission during the past month: Tariffs of the Burlington, Great Western, Rock Island, Missouri Pacific and Wabash railroads, advancing rates on various commodities between Missouri River points, from May 1st until November 1st; these tariffs were previously suspended from January 1st. Advances in class rates and commodity rates between points in Iowa and Minnesota points and points in Pacific Coast territory, from May 2nd until November 1st; these rates were originally suspended from January 2nd. Advances in rates on butter and eggs from Tacoma, Kansas and Memphis, Tennessee, and other points from May 1st, to August 29th; these rates were previously suspended from January 1st. Tariffs of the Frisco and other railroads proposing to cancel through joint class and commodity rates between stations located on the Kansas City and Memphis Railroad, from May 2nd until August 16th. Tariff of the Delaware and Hudson proposing to eliminate milling and transit privileges on corn milled or mixed at Oneonta, New York, from May 1st, until November 1st; this tariff was previously suspended from January 1st. Advances in rates on cotton seed from points in Texas to New Orleans from May 2nd until August 30th; these rates were originally suspended from January 2nd. Advances in the charge for the refrigeration of car load shipments of fruits, vegetables, etc., between points in Colorado and Utah, from May 1st until November 1st; these advances were previously suspended from January 1st. Schedules proposed to cancel joint through class and commodity rates from and to stations on the Bangor and Aroostook Railroad, on shipments via the Maine Central Railroad, suspended until July 17th. Tariff of the Southern Railway effecting tobacco rates from Winston-Salem, N. C., from May 18th until September 5th. Increase in lumber rates from California points to El Paso, Texas, suspended until September 2nd. Class and commodity rates between New Orleans and various points in the South to Chicago and other points in Illinois, on roads operating in Southern and Central Freight Association territory until September 2nd. Advances in cement rate over the Great Northern and Northwestern railroads from points in Iowa to points in Minnesota, North and South Dakota and Wisconsin, suspended until September 2nd. Tariffs of the Lackawanna cancelling the present joint class and commodity rates between points on the Morristown and Erie Railroad and points reached via the Lackawanna from June 1st until September 17th. Increase in freight rates on bituminous coal shipped from Illinois mines to Wisconsin, Minnesota and other States, suspended until September 9th. Advances in rates on calves from Refugo, Texas, to New Orleans and St. Louis, from May 14th until September 11th. Exceptions to Western Classification effecting the rate on iron and steel window sash from interstate points to points in Texas, Louisiana and Mexico, from May 11th, until September 6th. Increases in rates on structural iron and steel from the eastern and western destinations from May 15th until September 12th. Advances in rates for transportation of high explosives from St. Louis and Cairo and points taking the same rates to Boston, New England and Canadian points from May 15th to September 12th. Advances in carload rates on oranges from Folson, Cal., to Brighton, Cal., suspended until September 18th. Advances in rates on petroleum and petroleum products from Beaumont, and other points in Texas to Clifton, Arizona, from May 15th until September 12th.

Suspension Orders Vacated.

The Commission holds to be reasonable the proposed advances in class rates from Chicago, Peoria, St. Louis and points taking the same rates to Watertown and other destinations in South Dakota. The order of suspension issued against these rates was vacated as of April 29th.

The Commission has vacated its order of suspension issued against the advances in rates on olives, olive oil, drugs and other commodities from points in California to Eastern destinations. These advances, filed some time ago by the transcontinental freight bureau, it was said, have since been cancelled and the railroads have restored the old rates which were previously in effect.

The Commission has dismissed a complaint filed by the Parlin & Orendorff Plow Company of St. Louis, asking that an order be issued commanding the United States Express Company to return without charges a package shipped to Ozark, Ark., and intended for Ozark, Mo. When delivered to the express company the package bore the incorrect destination, and the accompanying receipt, already filled out by the shipper, showed the correct address. Before signing the receipt the express agent changed the designation to agree with that on the package. The Commission holds that the carrier in issuing receipt was not bound to call attention to the change in destination thereon the mistake having been made by the complainant in misdirecting the package. The Commission contends that the alteration made by the agent on the formal receipt was ample notice that an error had been made. If the agent had completely filled out the receipt in the first instance it would have read "Ozark, Ark."

ELECTIONS AND APPOINTMENTS.

Executive.

Daniel Breck, vice-president in charge of operation, Missouri, Oklahoma and Gulf. Headquarters, Muskogee, Okla.

Edward Chambers, vice-president, Atchison, Topeka & Santa Fe Railway. Headquarters, Chicago.

George J. Gould, president, Fort Smith & Little Rock Railroad Company.

E. F. Kearney, vice-president, Texas & Pacific. Headquarters, St. Louis, Mo.

E. L. Marbury, president, Alabama, Florida & Southern. Headquarters, Malone, Fla.

J. P. Morgan, Jr., director, Nickel Plate and Lake Shore and Michigan Southern Railway.

A. Pardee, vice-president, East Tennessee & Western North Carolina Ry.

G. L. Peck, director, the Panhandle.

Robert W. Perkins, president, Shore Lines Electric Railway. Headquarters, Norwich, Conn.

Henry Tatnall, director, Pennsylvania Company.

William V. S. Thorne, vice-president, Union Pacific, the Oregon Short Lines and the Oregon-Washington Railroad & Navigation Company. Headquarters, New York.

W. S. Wilson, vice-president and general manager, Alabama, Florida & Southern. Headquarters, Malone, Fla.

Legal.

W. A. Colston, general solicitor, Louisville & Nashville. Headquarters, Louisville, Ky.

Judge Thomas J. Freeman, general counsel, Texas & Pacific R. R.

J. G. Wilson, interstate commerce attorney, Southern Pacific Company. Headquarters, New York.

Financial.

F. W. Ireland, assistant treasurer, Fort Smith and Little Rock Railroad.

A. H. McCalef, secretary and treasurer, Fort Smith and Little Rock Railroad.

John M. Metheany, secretary and auditor, Grand Rapids & Indiana. Headquarters, Grand Rapids, Mich.

F. L. Paetzold, cashier, Great Northern Railroad Company.

John S. Wise, secretary and treasurer, East Tennessee & Western North Carolina Ry.

Accounting.

C. C. Barry, assistant comptroller, Southern Pacific Company. Headquarters, New York.

W. F. Bray, auditor and traffic manager, Alabama, Florida & Southern. Headquarters, Malone, Fla.

J. T. Ehricht, auditor, Wichita Valley Ry. Headquarters, Wichita Falls, Texas.

F. L. Fries, auditor of disbursements, Union Pacific.

A. W. Grindle, acting general auditor, Bangor & Aroostook Railroad. Headquarters, Bangor, Me.

W. L. Maury, consulting auditor, International & Great Northern. Headquarters, Houston, Texas.

F. W. Meyer, auditor, St. Joseph Terminal Railroad Company. Headquarters, St. Joseph, Mo.

W. E. Rittenhouse, auditor traffic accounts, C. H. & D.

C. S. Sikes, auditor, Pere Marquette R. R. Headquarters, Detroit, Michigan.

H. S. Walker, auditor and assistant secretary, Louisiana Western. Headquarters, New Orleans, La.

W. J. Werner, auditor, International & Great Northern. Headquarters, Houston, Texas.

W. B. Wilkins, assistant general auditor, Union Pacific.

Engineering and Mechanical.

W. H. Alderson, bridge engineer, Oregon-Washington Railroad & Navigation Company. Headquarters, Portland, Oregon.

B. H. Allmain, roadmaster, Seattle Division, Northern Pacific. Headquarters, Seattle, Wash.

P. Alquist, superintendent of car department, Missouri, Kansas & Texas. Headquarters, Sedalia, Mo.

J. A. Anderson, master mechanic, Baltimore & Ohio Railroad. Headquarters, Lorain, Ohio.

J. W. Barrie, principal assistant engineer maintenance of way, Florida East Coast Ry.

W. S. Basinger, division engineer, Southern Kansas Division, Atchison, Topeka & Santa Fe. Headquarters, Chanute, Kansas.

R. A. Becker, supervisor of signals, Eastern Lines, Grand Trunk System. Headquarters, Montreal, Que.

R. R. Black, roadmaster, Atchison, Topeka & Santa Fe Ry. Headquarters, Rincon, N. M.

Charles Boertman, superintendent of shops, Pere Marquette. Headquarters, Saginaw, Mich.

J. F. Bowden, master mechanic, Baltimore & Ohio Railroad. Headquarters, Newark, Ohio.

Oscar S. Bowen, resident engineer, Great Northern. Headquarters, Seattle, Wash.

J. W. G. Brewer, assistant district superintendent motive power, main line district, Baltimore & Ohio Railroad. Headquarters, Baltimore, Md.

F. W. Bruce, resident engineer in charge of the new municipal terminal development, City of Jacksonville, Fla.

J. E. Buckley, general foreman, third division, Boston & Maine.

Henry Williams, paymaster, Grand Trunk.

ORGANIZATION.

May Meeting of New York Railway Club.—The regular monthly meeting of the New York Railway Club was held on the evening of May 16th, and was addressed by Mr. Frederick C. Syze, whose paper was entitled: "Thoughts on Discipline."

Ending of Classification Hearings.—The Western Freight Classification Committee, which have been holding daily sessions at St. Louis, during the early part of May, adjourned on the 17th instant, after disposing of all the subjects on the docket. Tariffs will be filed with the Interstate Commerce Commission in due course.

Convention of Railroad Telegraphers.—On May 12th, four hundred delegates attended at Baltimore, the biennial convention of the Order of Railroad Telegraphers, representing a membership of forty thousand in the United States, Canada and Mexico. The sessions continued daily for nearly a week. Among the entertainments arranged for the visitors was a trip to Washington and an excursion on Chesapeake Bay. Governor Goldsborough addressed the delegates at a reception held on the evening of May 12th.

Meeting of Central Passenger Association.—At a meeting of the Central Passenger Asociation, held in Chicago, on May 14th, it was decided that the railroads connected with that organization should continue the present practice of absorbing telegraph expenses incident to handling prepaid orders for passenger tickets. A decision to this effect was reached after a number of the lines connected with the organization objected to the adoption of a plan, submitted some time ago, providing for a charge of one per cent of the price of the ticket for furnishing this service. The present practice has been followed for many years, and the roads which objected pointed out that the proposed change would subject the carriers to criticism.

Applications for low fares to a large number of conventions were disposed of by referring the applicants to the standing rule of the association that no fare shall be granted on a basis of less than two cents a mile in each direction.

Meeting of International Association of Ticket Agents.—A meeting of the Executive Committee of the International Association of Ticket Agents, was held during May at St. Louis. The principal business transacted was the selection for the annual convention, which was decided to be held at Grand Canyon, Ariz., the Santa Fe having offered a special train from Chicago, it being the intention to leave Chicago on March 18, 1914, going direct to Grand Canyon for a three days' session, returning by way of Dallas, San Antonio and Galveston, arriving in St. Louis and spending March 20th there, which will be the termination of the trip and the adjournment of the convention.

Railway Development Association.—The Railway Development Association, representing lines in the United States, Canada and Mexico, have decided to meet next year in Baltimore. W. W. Wood, of Baltimore, was elected president. The May convention was devoted to matters of interest to the industrial, immigration and agricultural departments of the railways, and the program included discussions on the following subjects: "Efficiency of Centralized Power Plants," "Agricultural Development," "Reclamation of Wet Lands by Drainage," and "Immigration Matters." William Nicholson, industrial agent of the Kansas City Southern, is secretary.

Meeting of Railway Surgeons.—Plans for establishing better sanitary conditions on railroads throughout the country, were decided upon May 6th, at the annual meeting of the Association of Railway Surgeons, held in Chicago. A committee was appointed to co-operate with a committee of the American Medical Association assigned to the promotion of public health and railway sanitation. It also was decided to ask the co-operation of State Boards of Health and health officers in various localities with a view of obtaining supplies of pure water and ice for use on railroad trains.

Dr. W. H. Bohart, chief surgeon of the Chicago and Eastern Illinois Railroad, was elected president of the association; Dr. G. G. Dowdall, chief surgeon of the Illinois Central road, vice-president, and Dr. L. J. Mitchell, editor of the "Railway Surgical Journal," secretary.

Storekeepers' Convention.—The tenth annual convention of the Railway Storekeepers' Association, was held in Chicago on May 19th to 21st, inclusive. The subjects of the papers presented, included:

"Reducing Inactive and Disposing of Obsolete Stock"; "Rolling Mills at Railroad Scrap Docks"; "What Effect, If Any, Has a Well-Organized Stores Department on the Operating Cost of a Railroad?" "Specifications for and Testing Materials and Effect on Storekeepers' Stock"; "Ice, Proper Method of Storage, Disbursement, Shrinkage and General Handling on Railroads"; "Standard Storehouse"; "Standard Stationery Storehouse"; Standard Supply Car"; "Standard Scrap Dock and Reclaiming Machinery." Reports were received from the Committee on Recommended Practices, Committee on Accounting, Committee on Piecework, Committee

Digitized by Google

on Standardization of Tinware, Committee on Stationery, Committee on Uniform Grading and Inspection of Lumber, Committee on Scrap Classification and Committee on Membership. A special committee had been appointed to prepare and submit for adoption a book on standard rules governing store department practices.

Canadian Demurrage Plan.—The Canadian Manufacturers' Association, representing most of the large shippers of Canada, is preparing an application to the Board of Railway Commissioners for an order approving and making effective the average demurrage plan on all the Canadian roads under the jurisdiction of the board. There is a widespread demand for the adoption of the plan.

Organization of a National Safety First Association.—The National Railway Safety First Association was formed at a meeting of the superintendents of the safety departments of various railroads at Chicago, on April 22nd.

The organization, which will include the heads of the safety departments of every railroad between the Panama Canal and the northern limits of the continent, has for its object the interchange of ideas to prevent loss of life and injury to passengers, employes and trespassers.

Motion picture entertainments, lectures, the posting of flaring bulletins, and newspapers will be enlisted to aid in reducing the loss of life and injury to a minimum.

The meeting was called by A. W. Smallen, head of the safety department of the Chicago, Milwaukee and St. Paul Railroad. Representatives from the following lines met the Chicago committee: New York Central and Lackawanna, from New York; Baltimore and Ohio, from Baltimore; Oregon Short Line, from Salt Lake City; Union Pacific, from Omaha; El Paso Southwestern, from El Paso; Missouri, Kansas and Texas, Wabash and Frisco Lines, from St. Louis, and Northern Pacific, from St. Paul.

Travel and Vacation Exhibition.—A number of prominent railroad presidents, including W. H. Truesdale, Delaware, Lackawanna and Western Railroad; Sir Thomas G. Shaughnessy, Canadian Pacific Railway Company; Louis Hill, chairman board, Great Northern Railroad; W. C. Brown, president New York Central lines; Howard Elliott, Northern Pacific Railroad; S. M. Felton, Chicago Great Western; Hon. Frank Cochrane, minister of railways for Canada; B. D. Caldwell, president Wells-Fargo Express Company; George W. Goethals, president Panama Railroad; E. Pennington, president Soo Railway; E. N. Brown, president National Railways of Mexico, and E. C. Schaff, president Missouri, Kansas and Texas Railway, are acting as honorary vice presidents of the Travel and Vacation Exhibition, which is to be held in the New Grand Central Palace in New York City in March, 1914. This exhibition is given with the view of encouraging the public to travel and disseminating information as to where to go, when to go, how to get there and where to stop. Many railroads, steamboat and steamship lines have taken space and are illustrating by popular demonstration the beauties and points of interest along the different lines or at terminals.

The exhibition is to be an international one and a number of foreign railroads will participate. Louis W. Hill has arranged to have a number of Blackfeet Indians from the Glacier Park reservation to attend and has secured government permission for their removal from the park to the exhibition.

Annual Convention of the Traveling Engineers' Association.—The twenty-first annual convention of the Traveling Engineers' Association will be held at the Hotel Sherman, Chicago, Ill., commencing Tuesday, August 12, 1913, and continuing four days.

The subjects to be discussed are as follows:

SUBJECTS:

1.—"Uniform Instruction to Enginemen on the Handling of Superheat Locomotives,"—J. V. Hardy, Chairman.

2.—"Credit Due Operating Department for Power Utilization and Train Movement that Reduces the Consumption of Fuel per Ton Mile,"—M. J. Howley, Chairman.

3.—"The Care of Locomotive Brake Equipment on Line of Road and at Terminals, also Methods of Locating and Reporting Defects."—H. A. Flynn, Chairman.

PAPERS:

1.—"Advantages Obtained with the Brick Arch in Locomotives,"—LeGrand Parish.

2.—"What Can We Do to Eliminate the Black Smoke Evil on Locomotives?"—J. H. Lewis.

3.—"Scientific Train Loading—Tonnage Rating. The best methods to obtain maximum Tonnage Haul for the engine over the Entire Division, taking into consideration the grades at different points on the Division,"—S. O. Heyer, Jr.

Indications are that the twenty-first annual convention will be a record-breaker.

International Engineering Congress.—In connection with the Panama-Pacific International Exposition which will be held in San Francisco in 1915, there will be an International Engineering Congress, in which engineers throughout the world will be invited to participate.

The congress is to be conducted under the auspices of the following five National Engineering Societies: American Society of Civil Engineers, American Institute of Mining Engineers, The American Society of Mechanical Engineers, American Institute of Electrical Engineers, and the Society of Naval Architects and Marine Engineers.

Entertainment of Chicago Traffic Club.—The Traffic Club, of Chicago, held one of the most successful entertainments in its history on Wednesday evening, May 14th, in the Red Room of the LaSalle Hotel, winding up the season's indoor entertainment program with a stag, smoker and cabaret show, consisting of eight acts. Light refreshments were served about 9 o'clock. Over 400 members and their guests attended. Among the out-of-town guests present were: H. C. Wilson, vice-president, Minneapolis Traffic Club; J. T. Johnson, president, Pittsburgh Traffic Club; H. Billings, president, Philadelphia Traffic Club; N. J. Elliott, president, Baltimore Traffic Club; W. C. Brown, secretary, Traffic Club of New England; F. C. Maus, vice-president, Louisville Traffic Club.

Meeting of the New Jersey Traffic Club.—The last meeting of the Traffic Club, of Newark, N. J., was held at the Washington, on Monday evening, May 5th. Charles A. Swope, General Eastern Freight Agent of the L. & N. R. R., and Secretary of the Traffic Club of New York, spoke on Traffic Clubs, their success, and the recognized good they have done.

The closing address was by Mr. George H. Pride, president and general manager of the Auto Transportation Company and a member of the Club. Mr. Pride is one of the early pioneers and in the comparison between horse and motor hauling, spoke of the many advantages and the few disadvantages of the more modern method.

Convention of Railway Fuel Association.—The fifth annual convention of the International Fuel Association was held in Chicago on May 21st to 24th inclusive. On the opening day after addresses by the president and by R. H. Ashton, vice-president of the Chicago and Northwestern, there was presented a paper on "Standard Form of Contract Covering Purchase of Railway Fuel Coal" and one on "Sub-Bituminous and Lignite Coal as Locomotive Fuel," followed by discussions. On May 22nd, there was a paper and a discussion on "Location, Construction, Development and Operation of a Bituminous Coal Mine" and the report of standing Committee on Firing Practice. On May 23rd, there was a paper and a discussion on "Self-Propelled Railway Passenger Cars" and on "Modern Locomotive Coaling Station: Its Design, Construction, Operation and Maintenance."

On May 24th, there was a paper, followed by a discussion on "Scaling of Locomotive Boilers and Resultant Fuel Loss," the report of standing Committee on Constitution and By-Laws, report of special committees, election of officers and the report of the Executive Committee on selection of subjects presented at the current meeting for discussion.

Spring Meeting of American Railway Association.—The spring meeting of the American Railway Association was held in New York on May 21st. Reports were presented by the committees as usual, including one from the Joint Committee on Automatic Train Stops, Transportation of Explosives and other Dangerous Articles; the Committee on Electrical Working and the Committee on Nominations.

Convention of Railway Claim Agents.—The annual convention of the Association of Railway Claim Agents was held in Baltimore on May 21st. The program was arranged by C. W. Egan, general claim agent of the Baltimore & Ohio. The address of welcome was made by Mayor Preston, followed by an address by James A. C. Bond, of Westminster, solicitor of the Baltimore & Ohio, on "The Relation Which the Claim Agent Bears to Other Departments of the Railroad Service and to the Public."

Ralph C. Richards, general claim agent of the Chicago and Northwestern, followed with an address on "The Revolution of the Railway Claim Department." The status of the workingmen's compensation laws in effect in the United States and Canada was discussed by the heads of the claim departments of a number of the leading railroads.

Pending compensation acts were discussed by L. M. Smith, claim agent of the St. Louis and San Francisco. The safety first movement and its relation to the prevention of accidents to patrons and employes was discussed by B. C. Winston, assistant attorney, Wabash, and C. W. Egan, general claim agent of the Baltimore & Ohio. Statistics of the results of the campaigns of safety which have been conducted by the American railroads were presented to the convention by A. A. Krause, general claims attorney, Missouri, Kansas and Texas, and the cooperation between the claims and safety departments was talked about by G. E. McCaughan, general claims attorney of the Rock Island. The trespassing evil and remedial methods was brought before the convention by W. P. Williams, claim agent of the Chicago, Rock Island and Pacific, and W. O. Reeder, district claim agent of the Missouri Pacific.

Annual Meeting of National Industrial Traffic League.—The annual meeting of the National Industrial Traffic League, was held in Buffalo on May 23rd and 24th. The meeting was to have been held in April, but was postponed on account of floods in Ohio and Indiana. The association is composed of shippers throughout the United States and has been a potent factor in the determination of many rate controversies. The following subjects were taken up for consideration:

"Bills of Lading—Uniform and Standard," "Bills Relating to Bills of Lading—(Congress"; "Uniform Classification," "Shippers' Evasion of Interstate Commerce Law," "Federal Jurisdiction Over Larceny of Interstate Shipments," "Interpretation of Demurrage Rules," "Incomplete Expense Bills," "Weights to Govern in the Assessment of Freight Charges," "Railroad Rules as to Storage of Freight," "Export Demurrage and Storage Charges," "Proposed Increase in the Demurrage Rate," "Appointment of Demurrage Supervisors," "New Form for Preparation of Claims," "Notice to Shippers of Refused and Unclaimed Freight," "Payment for Tariff Publications," "New Form of Bill of Lading and Waybill Combined, Introduced and Now Being Urged by the Pennsylvania Railroad." Reports —Finance Committee and secretary-treasurer, Freight Claims Committee, Transportation Instrumentalities Committee, Baggage Committee, Organization Committee.

Convention of Association of Railway Telegraph Superintendents.—The annual convention of the Association of Railway Telegraph Superintendents was held in St. Louis on May 20th. Papers were presented on "Some Facts Concerning Telephone Transmission," by Elam Miller and Charles A. Robinson, both of the American Telephone and Telegraph Company, New York; "Use of Telephone by Railroads for Dispatching Trains, Handling Messages, etc.," by J. C. Johnson, superintendent of telegraph, Pennsylvania Railroad; "Inductive Disturbances as Affecting Telegraph and Telephone Circuits," by F. J. Howe, Western Union Telegraph Company.

On May 21st, the papers comprised "Protection Against Lightning and High Currents for Telegraph and Telephone Equipment," by M. H. Clapp, superintendent of telegraph, Northern Pa-

Digitized by Google

cific; "Main Line Power for Selective Circuits, Including Transmission and Signaling," by Richard F. Spamer, Western Electric Company; "Full Use of Wires," by H. D. Teed, superintendent of telegraph, St. Louis and San Francisco; "Organization for Maintenance of Lines," by M. C. Allen, Western Union Telegraph Company.

On May 22nd there was a paper on "Organization for Wire Chiefs and Telephone Inspectors," by J. B. Sheldon, superintendent of telegraph, Union Pacific.

Convention of Order of Railway Conductors.—Approximately five thousand delegates attended the biennial convention of the Order of Railway Conductors, held in Detroit, Mich., on May 12th. A. B. Garretson, president of the Order, declared in his address to the opening session that, in his belief, the referendum vote of the railroad employes of 48 eastern lines, now being taken, would result in favor of a strike unless salary increases of 20 per cent are granted.

LEGISLATION.

National.—Last month attention was called to the dominating influence of labor in the passage of class legislation, such as the full crew bills of New York and New Jersey. Within the past few days another and more glaring evidence of this pernicious influence has been manifested at the National Capitol, in connection with certain riders attached to the Sundry Civil Appropriation Bill, which excludes labor organizations from the effect of the Sherman Anti-trust law. In other words, the riders forbid the Department of Justice to enforce the Sherman law against labor unions or organizations of farmers, and have thus granted immunity to half the population of the country to set at naught a most important federal statute. As the bulletin of the Merchants' Association of New York puts it: "The rider of the bill says in effect: 'This is a law and whoever fails to obey it, is a law breaker; but if farmers or workingmen break it, they shall not be punished for their crime.'" It would hardly be possible to conceive a more ill-advised method of attempting to nullify the statute. If the Sherman law ought not to apply to farmers and workingmen, it should be strongly amended to exempt them from its provisions. Such a change would be bad, but to license law breaking is infinitely worse, since it brings law into contempt. President Wilson has been petitioned by some of the largest organizations of the country to refuse to sign this bill with such riders attached, and in fact general indignation has been shown editorially in many quarters by the press of the country. All protest, however, has been of no avail.

Senator Root in combating the proposed legislation, said in addressing the presiding officer of the Senate:

"Let me ask you, sir, how will this present itself to the multitude of our citizens not included in these excepted classes? How can we fail to create a sense of injustice? How can we fail to create opposition to law, to create a feeling that it is right for men themselves to assert and to exercise the same freedom that is given to their neighbors? I can conceive of no more fatal blow to the enforcement of the statute than the law which exempts approximately half the people from responsibility for obedience to it, for you cannot enforce a law, sir, which is not an equal law for all the people. You cannot get juries to indict and to convict one man for doing what is permitted to his neighbor under the same law. If we attempt to retain the principle, to retain the declaration of illegality and exempt a part of the people from responsibility for obeying it we bring the law into necessary contempt and make it impossible to enforce it. We have a responsibility not to the laboring man alone, not to the farmer alone. We have a responsibility to the peace and order of our country."

Senator Lewis, the new Senator from Illinois, has drafted a bill providing for the establishment of a national wage committee, which would act as arbiter in questions involving wages. It would permit the President to appoint, "by and with the consent of the Senate," one citizen in each Congressional District, to serve as "wage commissioner" in the district named. The compensation for these commissioners would be $4,000 per year for an appointment of four years.

The bill, as referred to the committee on Interstate Commerce, would give the following authority to the commission:

That every institution, corporation, association or person, or existing thing or organization of any nature, exercising rights or enjoying privileges or existing by, through or under any law of the United States, or any institution, corporation, organization, association or person of any nature whatever, engaged in any form of interstate commerce, or interstate business, or interstate transportation, or any form of business connected with or having to do, in its nature, with interstate business of any nature whatsoever, in the United States, shall be and are, the subjects of this law.

Senator Cummins has drafted a bill creating a trade commission which shall examine into the business of corporations doing an interstate business for the purpose of finding out whether the anti-trust law is violated. The bill is based upon what is understood to be the doctrine of the Progressive Party for controlling corporations.

According to the Cummins measure, the commission is to be composed of three members appointed by the President for a term of nine years. The Bureau of Corporations is to be merged with the commission and reports are to be made to Congress and not to the President, as is the case with the present bureau. The commission is to have the power to subpoena and examine witnesses under oath and to require the production for examination of all documents, contracts, memoranda or other papers relating to commerce in which a corporation is engaged.

The trade commission is to be given the power to determine whether a corporation is employing capital to such an extent as to destroy or prevent substantially competitive conditions. If this fact is found and the corporation does not cease the practices objected to within a period set by the commission, the commission may present in facts to the Department of Justice, or may upon its own initiative institute a suit in equity against the corporation.

Digitized by Google

The Senate Territories Committee, have held hearings during the month on the Alaska Railway situation.

Several bills proposing a government bond issue to build railways are before the Committee, and one will be reported to the Senate before the end of this season. Government ownership or lease of the roads constructed, route, and other questions upon which Alaskans disagree, have been put aside, and an effort will be made to get the bill authorizing the railroads through Congress as soon as possible.

Senator Thomas has introduced a bill in the Senate providing new regulations regarding railroad tickets. The purpose of the measure is to remove all restrictions on transfers of tickets from the original purchasers to others. The bill will fix the penalty for refusal to honor such tickets at a sum not exceeding $50, together with responsibility in a civil action to any person injured or delayed by such refusal.

In the House, Chairman Alexander of the House Committee on merchant marine and fisheries, has introduced a resolution asking for the continuance of the appropriation in the shipping trust investigation. This continued appropriation is asked for, not only for the purpose of holding any more hearings, but to complete the report now in the course of preparation from which it is hoped remedial legislation may be devised. It is unofficially understood, that the report which is now being drafted, will recommend that a measure of continuance for the pooling or conference idea shall be allowed, subject to and on condition of strict government oversight of the operation of such combinations. Those who are in charge of the work, are said to be convinced that unregulated competition will result in the destruction of the regularity of sailings, in faulty distribution of tonnage, so that more harm to shippers would be wrought than good done to them through occasional reductions of rates in their favor. A resolution has been introduced in the House by Representative Neeley, of Kansas, which directs the Attorney-General to proceed against the Missouri Pacific Railway to collect $3,630,000 as repayment for money advanced by the government in financing the original road between Hannibal and St. Joseph, Mo. Representative Neeley insists that the $1,600,000 advanced by the Government should be repaid with interest.

Representative Dallin, of New York, has introduced a bill in the house to compel railroads to issue interchangeable mileage books, good on all lines, without any time limit restrictions and at the maximum rate of two cents a mile. The books would be in 500, 1,000 or 5,000 mile lots and the purchasers would be entitled to baggage privileges.

Connecticut.—The House of Representatives has passed a resolution to appoint a committee to investigate affairs of the New Haven road in that State.

Illinois.—A bill has been passed in the Senate, by a vote of 38 to 6, prohibiting the members of the legislation from riding in the future on railroad passes. This is the third time during the past six years the Senate has passed an anti-pass bill. The measure usually has been smothered in the House Committee. There appears more likelihood of its final passage on this occasion, however, since thirty-five States have enacted similar laws and the popular sentiment against the employment of passes in this manner, is very strong. Railroad officials who have recently been fighting objectionable bills now before the State Legislature, are hopeful of some measure of success, and believe that the full crew bill and the electric headlight bill, will not be reported favorable. It is probable, however, that the bill for semi-monthly pay days will win.

A bill has been introduced into the Legislature to amend the present union station statute, adopted in 1874, to provide that companies formed for the purpose of building union stations may be organized with a capitalization not to exceed $50,000.000. The present limit is $3,000,000. The bill was introduced in the interest of the proposed new stations in Chicago.

On May 14th, the initiative and referendum resolution was defeated. It received 101 votes, just one vote short of the necessary two-thirds.

Massachusetts.—The Committee on Railroads has voted to report a bill based on the petition of the Boston & Maine Railroad "for legislation to authorize it to operate four tracks through the city of Salem and to electrify its railroad between the cities of Boston and Beverly."

The sub-committee of the Railroad and Ways and Means Committee, held a conference recently with the railroad commissioners and Bank Commissioner Thorndyke concerning the pending railroad control bill. It was suggested to the sub-committee by the board that an amendment to the present bill be offered with the idea of safeguarding the investments of savings banks in the securities of the Boston & Maine and the New Haven, by providing that future issues, before they can become legal for savings bank investment, must be first certified as to legality by the railroad commissioners.

Uniform railroad regulation was discussed during the past month, with the Massachusetts Legislative Committee on railroads by representatives of all the New England States except New Hampshire, the delegations constituting the New England Conference on Transportation, recently appointed by the Governors of the several States.

The meeting, which was private, was called by Governor Baldwin, of Connecticut, chairman of the governors' Conference. The States were represented as follows: Maine, Franklin W. Cram, Bangor, Charles H. Osgood, Lewiston; Vermont, William B. Howe, Burlington, Percival H. Clement, Rutland; Massachusetts, Marcus P. Knowlton, Springfield, Francis T. Bowles, Boston, Gov. Foss; Rhode Island, William C. Bliss and Marsden J. Perry, Providence; Connecticut, George M. Woodruff, Litchfield, Costello Lippett, Norwich.

Governor Foss has signed a bill which assures one full day of rest each week to employes in industrial and mercantile establishments throughout Massachusetts. Exceptions are made in the cases of newspaper workers, janitors, bakers, drug clerks and persons caring for fires and machinery.

Michigan.—Border state control for all railroads operating in Michigan is advised by the joint legislative committee of that State, which has been investigating alleged irregularities in

Digitized by Google

the management of the Pere Marquette Railroad, now in the hands of receivers.

The report attributes the present difficulties of the Pere Marquette to mismanagement and stock manipulation. The committee's report says that the present receivership is capable, and should be given more power with which to regulate the service and to demonstrate whether the road can be operated upon a paying basis.

The committee says that the charges of "watered stock" have been proved to be without foundation and that all owners of bonds have just claims against the road.

Missouri.—The railroads have decided to submit the full crew bill to the people through a referendum which will prevent it becoming effective until next election.

The 47th general assembly passed and the governor signed a bill requiring foreign railroads to incorporate under Missouri laws. The governor declared that it would apply only to railroads hereafter entering the State and that, if it aimed at present foreign roads, it is unconstitutional, because it leads to an impairment of contract.

New Hampshire.—The State Senate has passed unanimously, the House bill authorizing the Public Service Commission to prepare a new schedule of railroad rates and fares.

The House passed, 283 to 56, a measure authorizing a bond issue of one million dollars for three East and West trunk line State roads from Marlow to Portsmouth, from Dover to Claremont and from Ossipee to Lebanon.

New York—The Foley-Walker workingmen's compensation bill, advocated by the State Insurance Department, but opposed by the State Federation of Labor, has been vetoed by Governor Sulzer. In his veto measure he says:

"I feel convinced that the objections urged against this bill are serious and substantial, and among them may be mentioned that the bill does not eliminate, or reduce to the lowest possible minimum, the waste of litigation which is the crying evil under the present system."

The bill introduced by Senator Cullen calling for extensive improvements in New York water front terminal facilities, has been signed by the Governor.

The new law places sweeping powers in the hands of the Board of Estimate, it being allowed to buy or lease water front property and take charge of water front improvements.

The main feature of the bill provides for the linking together of all the trunk lines entering New York into one big freight terminal. It also provides for the construction of warehouses, elevators and piers.

Governor Sulzer has disapproved the bill amending railroad law relating to conveyance of railroads and their franchises. In a memorandum he says:

"The purpose expressed in this bill of protecting the minority of dissenting stockholders, by requiring that if a road be sold to a parent company, its stock be appraised as provided by Section 17 of the stock corporation law, is worthy of approval.

"The difficulty with this bill is in the sentence, franchises, rights, powers and duties of the grantee company as a railroad corporation in this State, shall, after such conveyance, be extended so as to include and shall be exercised and observed, in relation to the railroad or part thereof so acquired.

"The bill vests the franchises and rights of the grantor corporation in the grantee corporation. We are familiar with mergers and consolidations, but it can not be deemed good policy to allow a number of other corporations having unlimited franchises to acquire the physical property of other corporations, or to be absorbed by other corporations with the franchises pertaining thereto; over which by aid of this act, such franchises will automatically extend."

Governor Sulzer has disapproved Assemblyman Hammer's bill amending the railroad law in relation to the establishment of stations and the stopping of trains thereat. In a memorandum accompanying his veto, the Governor says:

"This bill inserts in the railroad law a new section the purpose of which is to require the establishment of railroad stations on steam railroads in the borough of the Bronx, city of New York, and the stopping at such stations of all trains which pass through such borough on said railroads.

"The bill is absolutely unnecessary for the reason that the public service commission law confers power upon the Public Service Commission, after an examination and investigation, to regulate the matter of stations and the stopping of trains thereat."

Pennsylvania.—By a vote of 136 yeas to 48 nays, the House of Representatives adopted a resolution to submit to the voters a constitutional amendment providing for the initiative and referendum. There has been reported out of the railroad committee of the State Assembly a bill which railroad managers feel is seriously detrimental to public interests, and concerning which the public should be fully advised.

The bill provides that no person may be employed as conductor, brakeman, or engineer or fireman upon any railroad in the State of Pennsylvania unless he has been similarly employed for eighteen months and on the same railroad for three months previously to his appointment.

The bill, while it is called a safety measure, is really intended, the railroads claim, to make impossible the operation of a railroad in case of a strike affecting higher grades of employes.

At the present time, on the Pennsylvania Lines, East of Pittsburgh, the average service of a fireman before promotion to engineman is six to eight years; trainman before promotion to flagman is two to three years; freight flagman before promotion to freight conductor is six to seven years; passenger brakeman before promotion to passenger conductor is fifteen years, or more; these men usually passing through the grade of baggageman.

The provision in the bill that the last three months' service immediately preceding promotion shall be on the railroad on which he is to be appointed, is clearly intended to prevent the employment of men in case of emergency, notwithstanding the fact that they may be fully competent to perform the duties required of them.

Rhode Island.—Governor Pothier has vetoed the bill which would have permitted the lease of the Southern New England Railroad to the

Digitized by Google

Central Vermont Railway for a term of 99 years. The Governor said that the terms of the lease were not given and that he had been advised that it would take the property of the proposed line out of control of the State.

LEGAL.

Recent Supreme Court Decisions.—The Supreme Court of the United States adjourned on May 5th, without deciding the Minnesota rate cases. The Court on April 25th, however, allowed the State of Minnesota the right to file a brief in answer to the Government's brief in this case. It is chiefly contended that the Shreveport case which was used in the Government's brief, does not apply to the Minnesota case, and that the main issue in the Shreveport case is, may the Federal Court require the lowering of the Interstate rate to meet a low and reasonable intrastate rate prescribed by State authorities and acquiesced in by the carrier. In the Minnesota case it is claimed there is challenged the right of a State to establish a system of intrastate rates presumptively reasonable in themselves and having no reference to interstate commerce.

The Supreme Court has also granted an extension of time in which the Union Pacific Company must dispose of its 46 per cent in the Southern Pacific stock. This extension, however, is only from May 12th to July 1st, thus, only partially complying with the request of the Union Pacific attorneys for an indefinite extension of time.

The most important recent decision of the Supreme Court to the railroads, was one handed down on April 28th, in which the Court laid down the general principle that a creditor of a corporation, not a party to its reorganization, may hold its successor for its debt. In this specific case the court 5 to 4, in a decision which Justice Lurton, who dissented, declared "was alarming," held the Northern Pacific Railway Company responsible for $125,000 judgment against the Northern Pacific Railroad Company, despite the fact that the court expressly stated that no moral wrongdoing was to be found in the reorganization.

The Court held that the reorganization of the Northern Pacific in 1896 did not relieve the new company of the debts of the old corporation.

"When Boyd found the property in the same hands after the reorganization as before, he had a right to get the property for the payment of the debt, even though there had been a judicial sale," declared Justice Lamar. He held that although there had been no moral flaw yet the decree of sale of the property from the old Northern Pacific Railroad Company to the new Northern Pacific Railroad Company was void as to a non-consenting creditor.

Justice Lurton, in dissenting, held that the reorganization was not a mere transfer of the property of the Northern Pacific Railroad stockholders to themselves as stockholders of the Northern Pacific Railway, but was an effort of the stockholders to save the property in a situation where the property had gone into the hands of a receiver and where conditions were steadily growing worse. Therefore, he added, the sale should stand as valid against any one who, years after the sale, came forward to attack the act to save the property. Judge Lurton said the effect of the decision upon railroads reorganized about the time the Northern Pacific "was alarming."

Corporation lawyers who heard the decision declared it was a direct blow at the practice of reorganizing corporations to get rid of onerous contracts or to escape payment to unsecured creditors. The effect, the lawyers thought, would be far-reaching.

The Supreme Court has declared unconstitutional the Oregon reciprocal demurrage statute of 1907, without opinion, further than announcing that the action was based on the authority of the Hardwick grain elevator case. In the latter case, the Court held the Minnesota reciprocal demurrage law invalid, because it interfered with interstate commerce.

In a decision handed down May 12th, the Supreme Court declared that shippers who dictate railroad routes for their freight are entitled to recover from the initial carrier when freight is damaged on a connecting line. The decree was made in a suit of the Dixey Tobacco Company against the Norfolk and Western Railway and had previously been decided against the road by the Virginia Court of Appeals.

Attorney-General Felder, of Georgia, has procured from the Supreme Court an order for the Fifth United States Court of Appeals to send up for review its decision that the Louisville & Nashville Railroad Company and the Atlantic Coast Line Railroad Company, were not to be taxed upon property leased for ninety-nine years from the Georgia Railroad.

The Missouri, Kansas and Texas Railway has appealed to the Supreme Court in a suit brought against it by L. C. Cade, a track repair laborer, the question at issue being a statute of Texas which allows attorney's fees on claims for labor which are not paid within thirty days. In Cade's case, a claim for $10, the attorney's fees amounted to about $9, whereas the costs of the court were only 50 cents. The case comes direct from the court of the Justice of Peace, in Oak Cliff, Dallas County. The railroad fare of one attorney from Dallas to Washington is over $40.

The railroad company contested Cade's claim, first on the ground that it did not owe the money, and second, on the ground that the provision for attorney's fees conflicted with article 14 of the federal constitution. Appeal was taken direct to the United States Supreme Court, for the reason that for cases of this kind there is no appeal in the State courts from the decision of the Justice's Court. The grounds of unconstitutionality under the federal constitution made it possible to appeal to the highest court of the land.

The constitutionality of the federal hours of service law for railway telegraph operators, has been attacked in a petition filed in the Supreme Court by the St. Louis Southwestern Railway Company of Texas for a review of its convictions for violating the law. The railway had its day operators work from 7 A. M. to noon and, after an hour's rest, from 1 P. M. until 6 P. M., with like hours for night operators. It contended the law merely forbids "continuous" service of more than nine hours.

Commerce Court Decisions.—The Commerce Court has recently handed down two important

Digitized by Google

decisions sustaining the Interstate Commerce Commission.

In one case the Court sustains the right of the Commission to subordinate orders of the State Commissions, when such orders affect the interstate rates. The findings of the Commerce Court in the latter case sustain the Sanborn decision in the well known Minnesota rate cases, now pending before the United States Supreme Court for final adjudication.

If the Supreme Court sustains the Sanborn decision it means practically the elimination of State Railroad Commissions. The decision by the Commerce Court is regarded as a most encouraging development in favor of the contention of the railroads in the Minnesota rate cases.

In the so-called "Shreveport case" decision is an affirmation of the power of Congress and the authority of the Commission to remove a discrimination caused by State rates which are very much lower than reasonable interstate rates.

The Commerce Court held that the Interstate Commerce Commission had authority to correct the discrimination in interstate rates resulting from lower State rates being in effect between points similiarly situated. Judge Mack concurring in the decision held that if the roads had not acted voluntarily in putting the State rates into effect, but had been forced to such action by State authority, he could not have agreed with the majority of the Court.

The decision of Court says: "In the last analysis this claim of coercion would seem to beg the question to be decided, since it assumed that the petitioner is bound at all events to observe the rates fixed by the Texas Commission, although the order brought to be enjoyed justifies the application of higher charges. But if the action of Texas Commission regarding these intrastate rates is in derogation of the regulating power of Congress, the petitioner is not bound by that action but has the right to readjust its schedules in conformity with the order of the Interstate Commerce Commission."

Furthermore, it was pointed out that the order of the State Commission fixing lower State rates was to give an undue advantage to the industries in that State, which, the decision says, encroaches upon the field in which federal authority is exclusive and supreme. To hold otherwise in this case is virtually to admit that the purpose of the federal act may be thwarted and its operation made ineffective by the laws and administrative effort of the State of Texas.

In the other case decided by the Commerce Court—that of the Lehigh Valley Railroad against the Commission—the Commission made an order reducing the rates on anthracite coal transported by the railroad from the Wyoming region in Pennsylvania to Perth Amboy, this being the so-called "Meeker case." The railroad appealed, contending that, although the reduction was only a part of the freight it carried, the effect of such reduction would be to cut down the income on the investment value of its whole property to approximately four per cent on an alleged valuation of $312,000,000 and that it was therefore a confiscatory order. The carrier claimed that eight per cent was reasonable profit.

The Court held that, inasmuch as the Commission confined itself to consideration whether the rate charged between the points named on a single commodity was just and reasonable, the carrier could not say that, because the rate on such single commodity was reduced to a point which would result in the income of the whole road being reduced to four per cent approximately, a case of confiscation was made out. The decision then continued:

"The Court further holds that it cannot lay down general rules as to which is just compensation secured by the constitution to a carrier, inasmuch as the question of what is a reasonable rate is one for the Commission to determine and where a profit is being made there is no right on the part of a carrier to earn any fixed percentage of profit on its investment, regardless of whether a rate is or is not reasonable."

The Commerce Court has dismissed the appeal of the Kansas City Southern Railroad from an order of the Interstate Commerce Commission, establishing a uniform system of accounts for railroads and a classification of expenditures on betterments. The Court held that it had no power to interfere with the orders of the Commission prescribing bookkeeping methods and a "classification" may be reviewed only if unreasonable.

Arguments in the so-called tap line case, which has attracted country-wide attention will be presented to the Commerce Court in Washington, June 3d, next.

Four Railroads Indicted for Rebating.—Five indictments charging rebating and discriminating in sixty-three counts, have been returned against four railroads and a coal company by the Federal Court Jury at East St. Louis. The indictments set forth instances wherein it is alleged the laws were violated by the Vandalia; Cleveland, Cincinnati, Chicago and St. Louis (Big Four); Chicago, Indiana and Southern—the Grand Trunk Railroad, and the O'Gara Coal Company.

The penalty that may be imposed for violating the Elkins law in case of conviction is a minimum fine of $1,000 on each count and a maximum of $20,000 for each count, or $1,260,000 for the sixty-three counts.

Alabama Reduced Fare Enjoined.—The Federal District Court at Huntsville, Ala., on petition of attorneys representing the Louisville and Nashville Railroad, have issued an order restraining the Alabama Railroad Commission from requiring the railroad to reduce its passenger fares from 3 to 2½ cents per mile until the question can be presented to three federal judges, as provided by statute. A bond of $25,000 is required of the railroad and some plan for repaying passengers in event the Railroad Commission is eventually upheld in its order for a reduction of fares must be devised. A statement from the general passenger agent was presented to show that the reduction would cost the railroad $146,000 a year.

Appeal in West Virginia Two-Cent Fare Case.—The West Virginia Supreme Court having refused an appeal of the Norfolk and Western Railway in the two-cent passenger rate case, the Circuit Court has granted a stay of thirty days to allow an appeal to the United States Supreme Court.

Digitized by Google

Towermen Win Appeal.—The United States Court of Appeals at New Orleans, has decided that the laws governing hours of labor for employes apply to tower men as well as train crews and telegraph operators. The decision is expected to influence other courts throughout the country.

The test case was that of the Houston Terminal Company, charged with working its towermen on 12-hour shifts. The defense was that the law did not apply to this class of employes, who merely telephoned orders from one tower to another. This contention was sustained by the Circuit Courts of Texas and later appealed by the tower men who declare that their responsibility extends far beyond the mere transmission of train orders.

Reduction in Colorado Coal Rates Appealed.—The Colorado and Southern, the Chicago, Burlington and Quincy and the Union Pacific railroads have filed an appeal in the district court of Colorado from the decision of the Railway Commission in renewing an order of February, 1912, which had been issued by the Commission two years previously, reducing the freight on coal from the northern Colorado coal fields to Denver.

Baltimore and Ohio Bond Case Decided.—The Maryland Court of Appeals at Annapolis has handed down a decision holding that the Baltimore & Ohio Railroad is not subject to the Public Service Commission as to the financing of the system in respect to determining the aggregate amount of its capital stock bonded indebtedness, the price at which it shall be sold, or where or how the money realized from the sale thereof shall be expended.

There were four appeals in two cases relating to the sale of $63,500,000 in bonds and also a large amount of long term notes. The railroad company contended that its financing was not subject to the supervision of the Commission on the ground that its charter antedated the creation of the Commission. Counsel for the Commission made the point that the railroad company was required to obtain the Commission's approval of its financing and that the granting of the approval would be such a benefit to the railroad company as would waive its State tax exemption.

"In accordance with the foregoing conclusions these cases will be remanded to the Circuit Court No. 2 of Baltimore City without either affirming or reversing the degree appealed from, in order that the decree entered by the said court on the 25th day of February, 1913, and the 7th day of March, 1913, may be modified according to the terms set forth in paragraph No. 2 of this per curiam opinion. The reasons for the conclusions herein contained will be set forth in an opinion hereafter to be filed."

Liability Agreement Held to be Legal.—The Court of Appeals at Albany, New York, has upheld the liability of an agreement by a railroad employe under which he voluntarily joins a relief association whereby in consideration of the benefits accruing under such agreement, he releases his liability for accident.

The Court holds that the contract is not contrary to public policy nor to railroad law, which prohibits agreements between an employee and a railroad corporation exempting from or limiting the liability of a railroad to its employes. The Court also holds that the contract does not conflict with the insurance law.

Grain Door Decision.—The Court of Appeals, at Albany, New York, has recently held that, where a shipper is put to the expense of supplying grain doors for cars furnished him by the railroad company, and the shipments are consigned to another State, the shipper cannot recover in a State Court the expense incurred. The Court holds that such shipments constitute interstate commerce, and that the Federal Courts have exclusive jurisdiction over these cases. The lower court decision is reverse.

Southern Pacific Land Holdings Effected by Decision.—The United States District Court at Portland, Oregon, has ordered land stipulated to be worth $30,000,000 to be taken from the Southern Pacific Railroad and returned to the Federal Government.

The Oregon-California Land Grant case, involving more than 2,300,000 acres, will be carried to the Circuit Court of Appeals at San Francisco, and later to the United States Supreme Court for final adjudication.

STATE COMMISSIONS.

Arkansas.—Fruitgrowers in the western part of the State have decided to make a fight against the demurrage rules of the State Railroad Commission, which, they declare, increase freight tariffs and prevent the shipment of fruit in bulk.

California.—The Railroad Commissions of the States of California and Arizona, have approved the proposed issue of equipment trust certificates by the Southern Pacific Company. Kuhn, Loeb & Company, are offering $5,000,000 of these certificates, maturing in annual installments for ten years.

The $5,000,000 equipment trusts are part of issue of $10,120,000 authorized by the California Railroad Commission and by the Arizona Commission for equipment to cost $11,429,010, including 3,181 box cars, for $3,179,601; 114 locomotives for $2,548,174; 84 electric passenger cars for $1,160,369; 961 gondolas, $1,026,163; 700 work cars, $184,078; 850 stock cars for $850,350. The remainder is for automobile cars, flat cars, tank cars, and caboose cars. This equipment is to be used over the entire Southern Pacific System.

Canada.—The Railroad Commission has handed down a decision in the express rates inquiry, requiring the companies to submit new tariffs making a reduction of twenty per cent in the prairie and mountain sections, from the present standard maximum tariffs on freight classified as "merchandise."

Although the preparation of the new tariffs will take some time, the express companies are required to proceed without delay, "so as to insure the publication and filing of the new tariffs on or before July 15th." The board order further provides that the basis of standard maximum mileage "merchandise" tariffs shall not exceed $4 per 100 pounds in place of $5 for the prairie section, and $4.75 per 100 pounds in place of $6 for the mountain section for the 900-1,000 mile group. Eastern rates are affected.

Digitized by Google

Illinois.—A decision involving the application of the long and short haul law in Illinois which is regarded of exceptional importance to shippers and railroads throughout the State, will be announced soon by the Illinois Railroad Commission.

The law, which has been in effect since July 1, 1911, empowers the Commission to permit a rail carrier to charge a low rate for a long haul and a higher rate for a short haul, whenever competitive conditions among railroads warrant such action. There have been so many petitions for permits of this kind that the disposition of other cases has been delayed.

In response to an invitation from the Commission, attorneys for a number of railroads have submitted suggestions for the enforcement of a general rule to cover these cases which may lessen the number of petitions to be heard.

Missouri.—The State Public Service Commission has under consideration, the question of whether perpetual passes issued by railroads before the enactment of the utilities law, will remain in force. It will hand down a decision later. The pass question came up from an electric line in Jasper County. A former Board of Directors before retiring from office voted themselves life passes over the system. Whether these and other passes issued to persons in return for land for right of way come within the prohibition of the law is the question to be determined by the Commission.

An order was issued by the Public Service Commission authorizing the issuance of $1,050,000 refunding bonds, Joplin and Pittsburgh Railway Company, to take up debenture bonds outstanding.

The reasonableness of passenger rates will be investigated by the Commission if the United States Supreme Court decides adversely on the law establishing a maximum rate of two cents a mile. In the meantime the Commission has ordered all roads operating in the State to furnish it with copies of their schedules.

New York.—In compliance with a bill signed by Governor Sulzer, the public Service Commissions have assumed jurisdiction over baggage and transfer companies. The new law gives to the commissions jurisdiction over such companies to the same extent as it now has over railroad corporations and street railway companies in matters pertaining to rates, service and capitalization.

The same provision made in relation to the liability for loss, damage or injury to property in transit which has existed in relation to railroads is now applicable to baggage and transfer companies.

The Commission has received a petition from the New York Central & Hudson Railroad Company for leave to execute a mortgage extending the lien of the mortgage dated June 1, 1897, from the New York Central to the Central Trust Company, of New York, to secure bonds to the amount of $100,000,000, so that it shall cover properties now owned by the company, formerly owned by the Spuyten Duyval & Port Morris and other railroads.

VOL. LVII. JULY, 1913 No. 7

Important Developments in the Transportation Field

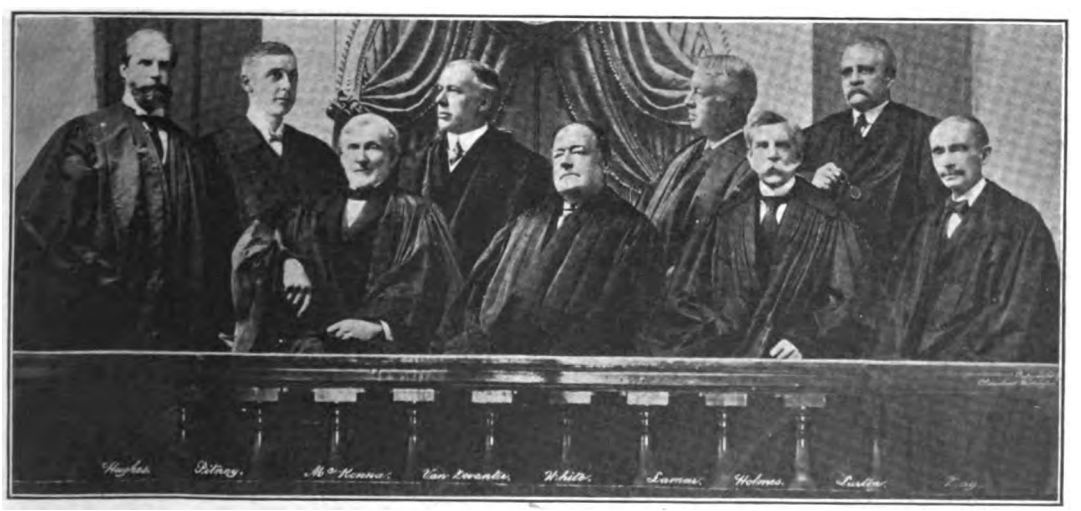
STATE RIGHTS AND THE RAILROADS

In one of the most notable decisions in recent years, the Supreme Court, on June 9th, upheld the power of the state to fix reasonable rates on the intra-state business of interstate railroads, until such time as Congress shall choose to regulate these rates. Two issues were involved in this controversy between the state of Minnesota and the railroad companies doing business within its borders. The first concerned the right of the state to fix rates on purely local business at such a figure as to interfere with interstate commerce, by forcing down, through the influence of competition, interstate rates on commodities shipped across the line. The second concerned the right of the railroad to a reasonable return on the value of their property employed in the public service.

Upon the first point the court held that Congress was supreme over interstate commerce, and that no act or regulation of any state authority could be allowed to interfere with the authority of Congress in so far as that authority had been exercised. In other words, if Congress had by statute, or if the Interstate Commerce Commission, to whom is delegated the authority of Congress over rates, traffic, etc., had by administrative orders, fixed certain interstate rates on traffic from points outside of Minnesota to points within that state, and had declared these rates to be reasonable, the railroad commission of Minnesota could not disturb those rates by reducing other rates subject to its jurisdiction. In the absence of such legislation or administrative order, however, the authority of the state over commerce originating and terminating within its borders is supreme. Neither Congress nor the Interstate Commerce Commission has acted in the matter before the court, and unless and until they do act the right of the state of Minnesota to regulate its own internal commerce must pass unquestioned. We quote upon this point sections 7 and 8 of the summary of the opinion of the court which was read by Justice Hughes:

"7. Under the established principles governing State action, Minnesota did not transcend the limits of its authority in prescribing the rates here involved, assuming them to be reasonable intra-state rates. It exercised on authority appropriate to its territorial jurisdiction, and not opposed to any action thus far taken by Congress.

"8. The interblending of operations in the conduct of interstate and local business by interstate carriers, and the exigencies that are said to arise with respect to the maintenance of interstate rates by reason of their relation to intra-state rates, are considerations for the practical judgment of Congress. If the situation has become such that adequate regulation of interstate rates cannot be maintained without imposing requirements with respect



SUPREME COURT OF THE UNITED STATES.

SUPREME COURT JUSTICE CHARLES E. HUGHES,
who prepared State Rate Decisions.

to much intra-state rates of interstate carriers as substantially affect interstate rates, it is for Congress to determine, within the limits of its constitutional authority over interstate commerce and its instruments, the measure of the regulation it should supply.

"It is the function of the court to interpret and apply the law already enacted, but not, under the guise of construction to provide a more comparative scheme of regulation than Congress has decided upon. Nor in the absence of Federal action, may effect be denied to the laws of the State enacted within the field which it is entitled to occupy until its authority is limited through the exertion by Congress of its paramount constitutional power."

On the issue of confiscation which was raised against the reasonableness of the rates established in 1907 by the Minnesota Commission, the court held, in substance, that the proof was insufficient to justify a finding that the rates were confiscatory in the cases of the Northern Pacific and the Great Northern, which, it was agreed, could be considered typical of the larger and stronger railroads affected by the decision. In the case of the Minneapolis and St. Louis Railroad Company, however, a type of the small and weak company, the decree of the lower court, which had adjudged that in reference to all the roads the rates were confiscatory, was affirmed.

The most important part of the opinion is the refusal of the court to accept in its entirety the theory of railroad valuation which bases it upon the cost of reproducing the property of the company. The court was willing to accept the standard of fair market value for the real estate of the companies, basing the value upon the selling price of adjoining real estate, but refused to accept the standards usually adopted in such cases, of multiplying the value of farm property, for example, by two and one half, to reach the cost of reproducing the railroad property. The point of difference concerned the method of valuing the railroad right of way. The court held, in substance, that the accepted method of arriving at the value was too hypothetical. It would not do to start from the assumption that the railroad was not in existence before arriving at a valuation of its property. The court must take the railroad property as it finds it and treat it exactly as any other kind of property. This method allows the railroads credit for the increase in land values but does not allow them to go beyond this. Aside from this modification of the hitherto accepted method of valueing railroad right of way property, the court affirms, in the broadest possible terms, the right of the railroad to receive a fair compensation on the value of its property devoted to public service. "The property of the railroad corporation," said Justice Hughes, "has been devoted to a public use, but the state has not seen fit to undertake the service itself and the private property embarked in it is not

HOWARD ELLIOTT,
President of the Northern Pacific Company.

placed at the mercy of legislative caprice. It rests secure under the constitutional protective, which extends not merely to the title, but to the right to receive just compensation for the services given to the public."

The other state rate cases, coming from Missouri, Arkansas, Oregon and West Virginia, were, on a later day, decided by the court according to the same principles which governed in the Minnesota rate case. In each case the sovereign right of the state to regulate its intra-state commerce was upheld.

While it is difficult to understand how the Supreme Court could have decided otherwise in these cases, it must be admitted that the situation arising out of these decisions is a most perplexing one for the railroads. It is true that some railway officials and corporation lawyers see in the decision a victory for the railroads. Mr. Newman Erb, for example, calls the decision a "vindication, not only for the Great Northern and Northern Pacific railroads, but for the Chicago and Northwestern, and practically all the railroads that joined in the fight," and he amplifies this statement by calling attention to the declaration of the courts against confiscatory rates and in support of the supreme power of Congress over interstate commerce.

There is nothing new, however, in the first declaration. The right of a public service corporation to a reasonable return on the fair value of the property devoted to public service has been recognized by the Supreme Court for nearly forty years. The statements in the Minnesota rate case were merely a reiteration of a long series of similar pronouncements. As for the declaration that the power of Congress, and of its delegated representatives, is supreme over interstate commerce, that is merely an affirmation of a portion of the United States Constitution. What is more to the present purpose, and what gives the railroad executives the greatest anxiety, is the invitation which the decision holds out to the railroad commissions of the state to embark on a campaign of rate regulation, each for itself, without reference to the bearing of its action upon rates from points outside of the states, but with a view to building up and protecting its own industries and shippers, and securing for them the maximum local advantage. In other words, the Supreme Court, although as we have said, it could not have acted otherwise, has invited the states, in the absence of legislation by Congress, to go back to the conditions of commercial warfare which prevailed among the states under the Articles of Confederation, the intolerable situation which almost led to interstate war, and which was remedied by the constitutional convention.

The commerce of the United States is not local but national. It is growing more ex-

Sykes, in the "Philadelphia Public Ledger."

TIME TO WAKE UP.

tensive in its ramifications every year. To allow each one of the states, through its delegated representatives, to make rates within the arbitrary and artificial state lines without reference to the general scheme of rates on the commodities affected, will result in inextricable confusion. It will produce a situation out of which no one will get any benefit and which will inflict frightful damage upon the railroads. For observe, the tendency of rates, as controlled by state commissions, is always downward, the aim of the commission is always to favor the shipper. With the different state commissions forcing rates downward the inevitable effect is to reduce, also, interstate rates in order to protect shippers in other states. The issue of confiscation relates, under the decision of the Supreme Court, only to the direct effect of the state rates. Since intrastate business is usually a small fraction of the total business of the railroads, this direct effect of intra-state rate reductions is small. In its effect upon the entire rate structure of the railroads affected, however, such action by a state commission may be extremely damaging.

We cannot believe, however, that this situation will be allowed to develop. Either by new legislation, by Congress, or by the ac-

Carter, in the "Minneapolis Tribune."

"ALL RIGHT—COME AHEAD."

A popular, if erroneous idea, of the effect of the Supreme Court state rate decisions. One of the unfortunate misconceptions which is likely to cause the carriers considerable trouble.

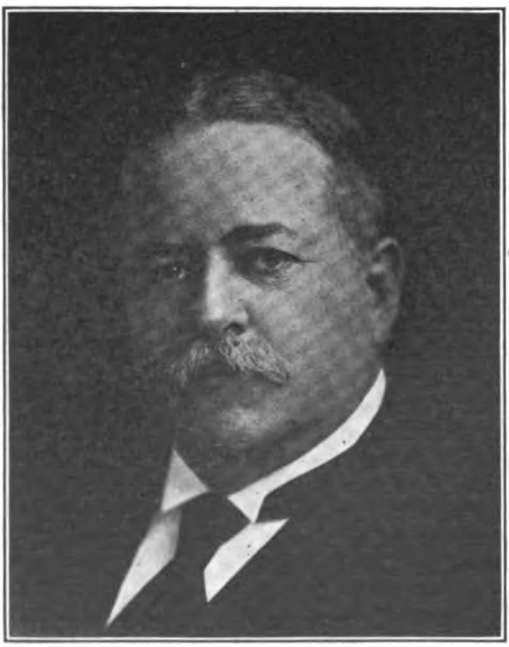
tion of the Interstate Commerce Commission, definite sanction will be given to existing interstate rates. After this is done, a disturbance of those rates by the action of a state commission would be held to be an interference with interstate commerce.

The railroads are looking forward with confident expectation to a development of this principle in a decision of the Interstate Commerce Commission in the Shreveport case which will be settled in the autumn. In this case the Interstate Commerce Commission ordered reductions in certain interstate rates from Shreveport, La., to Texas points, on the ground that they were discriminatory as compared with certain state rates which had been reduced by the railroad commission. The Commission, however, did not compel the state roads to put the lower rate into effect until the case was finally decided, implying, in other words, that the interstate rates if ordered were not reduced because they were unreasonable in themselves, but because they were out of harmony with the lower state rates. The Supreme Court in this case will, therefore, be asked to decide whether a rate which the Interstate Commerce Commission declares to be reasonable may be forced down by state regulations. If the court refuses to interfere, holding to the same ground that Congress has not specifically prohibited such

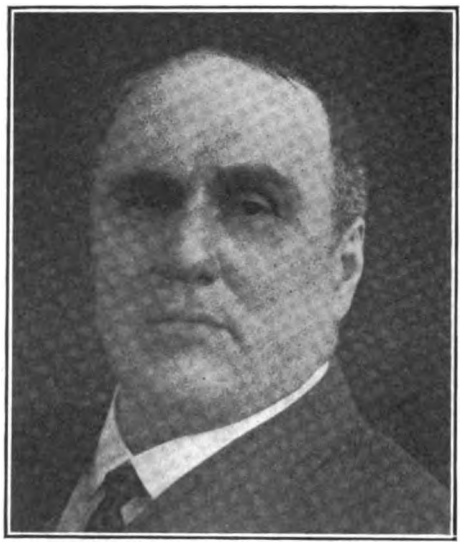
Digitized by Google

interference by state commissions with interstate rates, and also because this interference is indirect, resulting from the influence of competition, all that will remain for the railroads will be to start a campaign for the assertion, by formal statute of the supreme power of the Interstate Commerce Commission over all railroad rates which directly or indirectly relate to interstate commerce. Congress, as the court said, has the power to enact such legislation and it is believed that the states themselves will not oppose it.

The present stiuation contains the possibilities of very damaging interference with commerce. Parallel cases can be pointed out; at one time the states had large influence over navigable water ways; confusion resulted from conflicting jurisdictions, and state control has completely disappeared from this field. The pure food laws furnish another illustration of the surrender of the states to the federal government. It is entirely too early for the railroads to give up hope of a favorable outcome of the controversy. The Supreme Court in the Shreveport case will have an opportunity to undo the damage which has already been done, and to point the way for the Interstate Commerce Commission to come to the assistance of the railroad. If this hope fails there remains the appeal to Congress.



JULIUS KRUTTSCHNITT,
Chairman of the Board of Southern Pacific Railway.



A. L. MOHLER.
President of the Union Pacific Railroad.

FINDING A SOLUTION FOR THE HARRIMAN LINE DISSOLUTION PUZZLE

The Pennsylvania Railroad Company has volunteered to assist in the solution of the problem presented by the ordered dissolution of the Union Pacific-Southern Pacific combination. The Pennsylvania has offered to take over 382,924 shares of Southern Pacific from the Union Pacific, delivering in exchange all of the Baltimore and Ohio common and preferred stock which it now owns. The values of the stocks agreed upon as the basis of the exchange, are $100 per share for Baltimore and Ohio common, $80 per share for Baltimore and Ohio preferred, and $100 per share for the Southern Pacific. Union Pacific at present owns 322,342 shares of common stock and 72,064 shares of preferred stock of the Baltimore and Ohio. If the proposition of the Pennsylvania is approved by the court these holdings will be increased to 536,078 common shares, and 284,800 preferred. The total outstanding stock of the Baltimore and Ohio is 1,519,500 shares of common and 588,654 shares of preferred. If the exchange is made, therefore, the Union Pacific will own nearly one third of the common and more than half of the preferred, giving it a dominating interest in the Baltimore and Ohio. The offer is made by the Pennsylvania, not, as the imaginative newspaper writers have indicated, to secure a coast to coast route,—but little railway traffic moves from coast to coast,—the

Digitized by Google

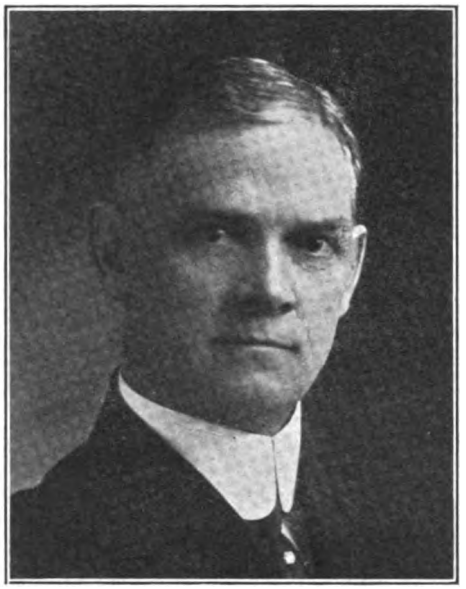
Pennsylvania had no other motive than to relieve a difficult situation by reducing through this exchange the number of shares of Southern Pacific stock which the Union Pacific would dispose of. After the trade is made, there will still remain 883,357 shares of Southern Pacific to be sold.

It is a fair presumption, also, that in time, as market opportunity offers, the Pennsylvania will sell its Southern Pacific stock, and the Union Pacific will dispose of its Baltimore and Ohio. The suggestion has been made that since no such satisfactory plan as this has been proposed to enable the Union Pacific to rid itself of its Southern Pacific stock without heavy loss, similar exchanges may be made by other roads out of their treasury assets, so that the entire amount of Southern Pacific stock may be taken out of Union Pacific hands without any of it being offered for sale in the present very unsatisfactory market.

Attorney General McReynolds is growing impatient with the delay in carrying out the orders of the court. On June 12th, at St. Paul, he commented with much severity upon the failure of the Union Pacific to obey the court order. "The time has come," he said, "for the court to order something to be done," and the proposition to sell the stock within one year, if it could be done without loss, he said, might leave the situation at the end of the year exactly as it is at present. The Attorney General asked the court to either appoint a receiver to dispose of the stock, or to devise, itself, some means of disposing of it. It is evident, from the attitude of the Attorney General, that some action must be speedily taken in this matter and the plan of exchange proposed by the Pennsylvania seems to offer the most feasible solution. It would indeed be most unfortunate if the investment situation, already so tense and difficult, should be further complicated by the offering of immense amounts of railroad securities for compulsory sale.

PROGRESS IN PHYSICAL VALUATION PLANS

Rapid progress is being made in the preliminary work in connection with the physical valuation of the railroads. At a recent conference between railroad presidents, representing 80 per cent of the railway mileage of the United States, and the Interstate Commerce Commissioners, President Samuel Rea, of the Pennsylvania, stated that the railroad companies were prepared to co-operate with the Commission and proposed that each railroad should have a committee of its own officers devoting their time to the work. The best of feeling between the Commission and the railroad presidents was manifested by both sides and there is no reason to expect that serious controversies will develop as the work proceeds. The Supreme Court, as already pointed out in the Minnesota rate case, has indicated certain principles of valuation of which it approves. The fair market value of the property, measured by the value of adjacent property, must be the criterion, instead of the value of the property for railroad purposes.



E. E. CLARK,
Chairman, Interstate Commerce Commission.

"It is manifest," said Justice Hughes, "that an attempt to estimate what would be the actual cost of acquiring the right of way, if the railroad were not there, is to indulge in mere speculation. The railroad has long been established; to it have been linked the activities of agriculture, industry and trade. Communities have long been dependent upon its services, and their growth and development have been conditioned upon the facilities it has provided. The uses of property in the communities which it serves are, to a large degree, determined by it. The values of property along its line largely depend upon its existence. It is an integral part of the communal life. The assumption of its non-existence, and, at the same time, that the values that rest upon it remain un-

Digitized by Google

changed, is impossible and cannot be entertained."

An acceptance of this principle by the Interstate Commerce Commission will eventually result in reducing the valuation of the railroads in the West and South, where right of way real estate bears a much greater proportion to the total real estate value of the companies than in Offical Classification territory, where the terminal properties located in the large cities make up such an enormous total. At the same time, valuations of all property will be considerably reduced by this qualification of the theory that cost of reproduction determines value.

DEVELOPMENTS IN NEW ENGLAND

The latest development in the New Haven and Hartford situation is the formation of a stockholders' committee to act as proxy for shareholders, and to bring to bear on the New England railroad situation the unbiased judgment of representative stockholders who have not previously taken part in the management. The chairman of the committee is Mr. George Von L. Meyer, and Richard Olney is elected as one of the counsel of the committee. The committee disclaim, in a circular asking proxies from stockholders, any intention to criticise the management. Their purpose is to study the policy of the company, both financial and operative, and to initiate appropriate action to remove the apprehensions of investors. The committee will co-operate with the directors in working out the problems of the road.

The final result of this period of investigation through which the New Haven is now passing will, no doubt, be beneficial to the company and to New England. Many serviceable facts will be brought out. It seems, however, that, as we have several times remarked, the New Haven has had rather more than its fair share of investigation, and that if it is now to be carried by the stockholders' committee it will have just cause to complain. If the officials of the company can have a little respite from the attacks which have been centred upon them by New York, Boston and Washington, they may be able to give more attention to the performance of their important public service. In this connection it is interesting to note certain facts brought up in a public advertisement of the New Haven showing the safety of passenger travel. The New Haven has been roundly denounced in the newspapers because of its alleged neglect of the factor of safety. The official records show that in the ten years from June 30, 1903, to June 15, 1913, the New Haven operated over 5,000,000 trains carrying 755,000,000 passengers. In these ten years there were six accidents to trains in which persons traveling on them were killed. The number of passengers who lost their lives as result of such accidents was 29. In six of these ten years not a single passenger was killed in an accident.

BOSTON LOSES DIFFERENTIAL CASE

The Interstate Commerce Commission made two important announcements during the past month. On June 17th a decision was issued that freight rates on westbound import traffic must not be lower from Boston than from New York City. This concludes the celebrated differential controversy which has been waged for a number of years between Boston on the one side, and New York, Philadelphia and Baltimore, on the other. For many years certain differentials have been maintained by the railroads on westbound import traffic from the three cities last mentioned. Boston considered that these differentials were unfair and a rate war was begun by the Boston and Maine to secure equal treatment for Boston. The reductions by the Boston and Maine were met by the Trunk Lines and the rate war finally resulted in the carrying by the railroad of import traffic at lower rates than those applied to domestic traffic, in some cases at less than the cost of service.

The Interstate Commerce Commission, being appealed to to act as arbitrator, established certain rates which maintained generally the former differentials. A supplemental opinion held that rates on import traffic should not be lower from Boston than from New York. The shipping interests of Boston joined with the Boston and Maine and the Boston and Albany in asking for a rehearing and the petition was granted "on the sole question of the relationship of the inland rates on import shipments destined to the so-called differential territory as between Boston and New York." In the opinion handed down on June 17th, the Commission points out that to grant the petition of Boston would precipitate another rate war which might be more far-reaching than the last. In conclusion, the Commission says: "It is strongly urged that

Digitized by Google

unless the import rates from Boston are lower than from New York, it will be harmful to existing conditions, and make it difficult for Boston to retain the import business which it now has. However much sympathy we may have with that argument we cannot make it the basis of a finding as to unjust discrimination, such as is prohibited by the act."

The Commission's decision in this matter must be heartily approved. It is in line with the policy, which has been consistently approved for many years, of giving a larger importance to distance as a factor in the freight rates. New England has, for many years, as former President Tuttle of the Boston and Maine once pointed out, depended largely upon relatively low freight rates to maintain her industrial position. Nothing is more certain from the development of the attitude of the Interstate Commerce Commission than the gradual elimination of these differential advantages.

REOPENING OF ADVANCE RATE CASE DENIED

The Commission has denied the application made by the Eastern roads for a reopening of the rate advance case of 1910. In place of this proceeding the Commission has instituted an investigation into the general rate situation. This will be completed by its own experts during the summer, and in the autumn a number of hearings will be held at which representatives of the different interests concerned will be given an opportunity to present their case. From our standpoint this decision is not unfavorable to the railroads. As we pointed out, in previous discussions of the subject, it would be necessary for the railroads to make out a very strong case to warrant the Commission in reversing its decision of two years ago. It would be necessary to show that conditions had radically changed, and that all of the important points urged by the Commission against the petition of the railroads were not applicable to the present situation. While we believe this could be done, yet the test would be extremely difficult. The Commission will find from its inquiry that the railroads are in great need of new capital and that the new capital cannot be obtained on the basis of existing revenue. The same facts will be brought out in the hearings. It is difficult to understand what action can be taken by the Commission, on the basis of this information, which would not be as favorable to the railroads as anything they could hope for, by securing the reopening of the case involving a flat five per cent increase.

PANAMA CANAL DEVELOPMENTS

The Panama Canal will be opened during the fall or winter. The water will be let into the canal about October first, after which the dredging remaining to be done will go forward more rapidly. With the appointment of Richard Lee Metcalfe, associate editor of the *Commoner* and a close personal friend of Secretary of State Bryan, as Governor of the Canal Zone, the first step is taken in the permanent organization of the government of the zone. The Panama Canal toll question is not likely to be taken up seriously until the regular session of Congress next winter. Several bills on the question are pending before the House Committee on Interstate and Foreign Commerce. There is every reason to expect a repeal of the exemption. Representative Steenerson of Minnesota, sets forth the prevailing view when he says: "Vessels of the United States have an exclusive right to engage in this (coastwise) trade, all other vessels being by law excluded therefrom. This condition has heretofore resulted in many monopolistic combinations of coastwise vessels to such an extent as to call for criminal prosecutions

COLONEL GOETHALS,

whose genius and energy have proved a potent factor in the construction of the Panama Canal.

under the anti-trust law. Such exclusive right, together with the subsidy of free canal tolls, will hold out still greater inducements to such monopolistic combinations and extortion, whereby not only the tolls, but the benefit of cheaper water transportation between the coasts instead of benefiting the public, will all be absorbed by the carrier in this trade. Free passage to vessels of the United States through the canal ought to be sufficient advantage to enable them to compete against other vessels paying tolls."

PUTTING THEIR CASE BEFORE THE SHIPPERS

At a noteworthy meeting of New England business men and shippers held on June 12th, in Boston, under the auspices of the Boston Chamber of Commerce, the presidents of three great railroad systems, the Pennsylvania, New York Central and the Baltimore and Ohio, presented arguments in favor of support of the position that the railroads should be permitted to advance their rates. President Willard, after summarizing the large increases in operating expenses on his lines, which have so greatly reduced the margin between income and expenditure that the company does not feel justified in further increasing its capital account, took up the important point of the uniform advance in all rates. He showed it was impracticable to advance rates on the weak railroads without allowing the strong roads a similar privilege. The only effect of such an unequal advance would be to make the weak roads still weaker by diverting their traffic to the roads with lower rates. So complicated is the rate structure that a flat advance, applicable to all rates within the territory affected, is the only practicable method of affording the railroads relief.

In this connection it may be pointed out that the Supreme Court totally failed to grasp this principle in the Minnesota rate case. Its decision allowed the Minneapolis and St. Louis, as representing the weaker roads in this territory, to maintain its former rates, while compelling the strong roads to reduce them. In fact, however, the Minneapolis and St. Louis will be forced by competition to reduce most of its rates to the level of its competitors. This question has been frequently raised in proceedings before the Commission, as to whether some roads should be allowed higher rates than others. In the opinion of February 22, 1911, Commissioner Prouty referred to the matter in the following words: "In 9 I. C. C. R. p. 382, this Commission considered the justice of certain advances in grain rates between Chicago and the Atlantic seaboard, and it there held that whatever rate might be reasonably imposed upon these three systems (Pennsylvania, Baltimore and Ohio and New York Central) must be held to be a reasonable charge for that service by all lines. We hold to the same view in this investigation. We do not mean that other lines should not be considered, but that these systems should be taken as typical. Under rates reasonable for these three systems there may be lines whose earnings will be extravagant but that is their good fortune. There may be lines which cannot make sufficient earnings but that is their misfortune. We ought not to impose upon this territory for the purpose of allowing these defendants additional revenue higher rates than are adequate to these three systems considered as a whole."

President Rea, in his address, laid particular emphasis upon the right of the public to receive from the railroad a safe and efficient public service. To this end roadbed, equipment and other facilities must be adequate. In the public interest, therefore, he urged that since railway revenues, with the exception of a few of the strongest companies, were insufficient to finance necessary capital expenses, an advance in rates should be allowed, and he made the following significant utterance: "All questions of valuation and rate making cannot evade the main one,

Digitized by Google

credit and a fair return on capital. If this cannot be had, public ownership is the only alternative, but we believe public opinion will continue to endorse and support private ownership and operation under government regulation."

President Brown, of the New York Central, spoke in similar vein, laying especial emphasis upon the public necessity, altogether aside from the private interests of railway investors, that railway revenue should be increased so that sufficient capital could be provided.

On June 6th, Mr. George D. Dixon, vice-president of the Pennsylvania, at a meeting of the Pittsburgh Chamber of Commerce presented some interesting comparisons in support of the advance in rates. He pointed out that wage payments were now 37.1 per cent higher than in 1900; that operating expenses, including taxes, had increased from 67.7 cents to 78 cents during the same period, that the extra crew laws had increased the operating cost of the Pennsylvania lines east of Pittsburgh alone $756,790, and that from 1906 to 1913 the Pennsylvania Railroad had paid out $9,936,134 to comply with new state and federal laws.

The Pennsylvania Railroad, said Mr. Dixon, did not plead poverty or pressing danger. Its financial position is too strong to fear disturbance. Its officials believe, however, that with the larger revenues which they may secure from higher rates they will be able to raise the already high standard of their public service.

AMENDING THE ERDMAN ACT

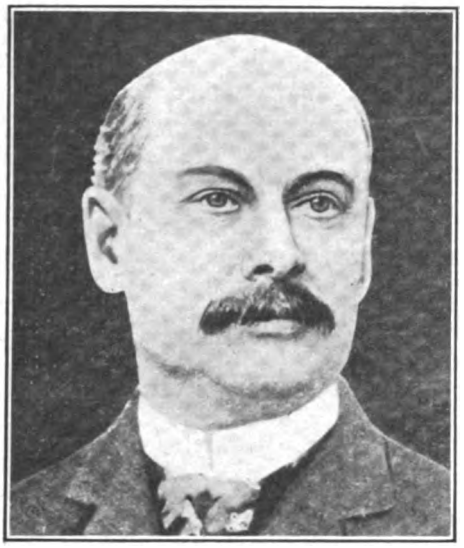
The Erdman Act will be amended. So much has been agreed upon by representatives of the railway brotherhoods and the railroads. The plan of conciliation provided by the Erdman Act was not intended to cope with such far-reaching and complicated controversies as those in connection with whose settlement it has recenly been invoked. It was primarily designed to cover the case of one railroad dealing with a group of its own employes. It has been applied to handle situations embracing fifty-four railroads and half the railway traffic of the country. The new act, according to President Seth Low, of the National Civic Federation, will provide for an increase in the number of arbitrators from three to six, adding one to the representation of each of the three interests, the railroad, the employe and the public. President Low, in a statement outlining the proposed amendment, refers to the fact that six is the number of arbitrators chosen in several important international disputes, and that the danger of a deadlock in a board of six in which two of the arbitrators were not related to either side of the controversy would be even less than in the case of arbitration in which two nations were equally represented. It will also be proposed that a national commissioner of mediation and conciliation to be appointed by the President in the usual manner, shall be provided for.

The time is not yet ripe for compulsory arbitration of railway labor disputes. If the methods of conciliation, supplemented by voluntary arbitration, can be made to serve, it will be far more satisfactory, since both sides are more willing to accept the terms of the arbitration. We cannot overlook the fact, however, that the railroads have hitherto fared badly at the hands of these arbitration boards, and that not until some definite standard of return on railway capital shall be made the starting point for the adjustment of all such disputes, can a permanent cure of an almost intolerable situation be hoped for.

PROGRESS IN UNITED STATES STEEL DISSOLUTION

Early in June the defense opened in the suit of the Government to dissolve the United States Steel Corporation. While no new facts have been brought out by the witnesses —and indeed it is impossible to discover anything concerning this much-investigated company which has not already been made public—the array of present and former officials of the company presented a strong case in its defense. Former President Chas. M. Schwab testified that the main purpose in forming the corporation was to increase the efficiency of production with especial reference to enlarging the foreign trade with the United States in steel products. His testimony strongly supported that of President Farrell, who showed the remarkable growth in the company's foreign trade, which now amounts to over $100,000,000 a year. Mr. Schwab admitted the strong position of the United States Steel Corporation in its ore reserve, claiming that it is impossible that any company of the magnitude of the United States Steel Corporation could be organized in the future because of the difficulty of obtaining

Digitized by Google

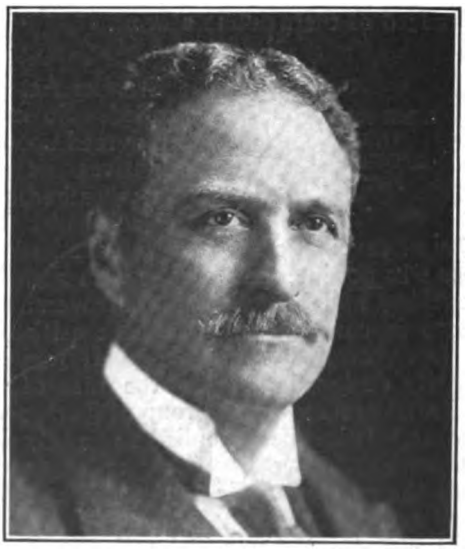


JUDGE E. H. GARY,

Chairman of the United States Steel Corporation.

raw material. He indicated, however, that in the Eastern States no difficulty was experienced in securing abundant supplies of ore, and he predicted that the Bethlehem Steel Company would, in time, produce as great variety of steel products as the United States Steel Corporation. Percival Roberts, Jr., former president of the American Bridge Company, corroborated President Farrell and Mr. Schwab in their opinion that the formation of the steel corporation had been to further the foreign trade. He illustrated the success of the company in the export trade by comparing it to a department store proposition, in which the overhead charges were distributed over so great a variety and volume of products as to enable the necessary price reductions to be made. In this connection President Farrell had previously offered an interesting explanation of the admitted practice of the Steel Corporation in making lower prices for export trade. He compared this to the practice of the railroads, which has been sanctioned by the Interstate Commerce Commission, by making low freight rates on export business. For example, he said that goods consigned to San Francisco for use in San Francisco paid a higher freight rate than goods shipped through San Francisco to China. In making lower prices to secure foreign business the Steel Corporation was merely imitating methods sanctioned by the Government. Mr. Robert Bacon, a former member of the firm of J. P. Morgan and Company, and still a director of the United States Steel Corporation, was another witness who testified that the elimination of competition by the Carnegie Steel Company with the other steel consolidations, was not an impelling motive toward the formation of the United States Steel Corporation.

The most interesting and important witness who appeared on behalf of the Steel Corporation, was Judge Elbert H. Gary, chairman of the Finance Committee. Judge Gary has had more experience on the witness stand than any corporation official in the United States. Time and again, before various committees of Congress, he has traversed the familiar ground which he again covered in his testimony. He corroborated the former witnesses as to the reasons for the formation of the United States Steel Corporation, declared that the company's policy had never been to take an unfair advantage of their competitors, that their policy had been opposed to price agreements, and that he had had no personal knowledge of any agreements entered into by the heads of the subsidiary companies. He further said that it had been his constant endeavor to introduce harmony into the steel trade, that his purpose in giving the now famous Gary dinners was to develop a spirit of harmonious co-operation among the steel producers, as a result of which each one would voluntarily abstain from



ROBERT BACON,

former member of the firm of J. Pierpont Morgan and Company, and a director of the United States Steel Corporation.

Digitized by Google

reckless price-cutting and other trade destroying methods.

In reference to the charges of discrimination by the ore roads, Judge Gary claimed that the superior facilities offered by these roads were available to all shippers alike without discrimination, and that competitors of the United States Steel Corporation had profited largely from the superior facilities which these railroads offered. He was especially emphatic in denying that men were elected to the United States Steel Corporation board of directors because of their interest in railroads and other companies which consumed large quantities of steel products. In this he followed Mr. Roberts who testified that although a director of the United States Steel Corporation and the Pennsylvania Railroad Company he had never attempted to influence the railroad company in its purchases, and in fact had always refused to vote on matters to which the United States Steel Corporation was a party. Judge Gary declared that merit was the only test applied to determine the availability of a man to sit on the board of directors of the United States Steel Corporation.

The company has always, he said, maintained full publicity in regard to its affairs. "Our attitude has been that if at any time our policies, principles, position or methods of management did not meet with the full approval and agreement of the administration, or any other department or bureau of the federal government, concerning each or all of our subsidiaries, we have always been willing and did alter them to meet the feeling or overcome the criticism of the government department."

When the company was first organized, he said, he stated in a meeting of the board of directors, that the new enterprise could not hope to succeed unless it squared its conduct with the highest principles of business ethics. It had been his constant endeavor, in his conduct of the affairs of the Steel Corporation, to carry this principle of action into practice. The company had been fair to its competitors, it had prevented prices from rising quite as often as it used its influence to keep them from falling, it had paid high wages and greatly improved the conditions of employment, it had spent money freely to improve the processes of manufacture and to expand its trade into foreign countries, it had been scrupulously fair to its competitors, and it had endeavored to faithfully observe the law.

DEVELOPMENTS AT THE NATIONAL CAPITAL

The tariff bill drags its slow length along. From present appearances the measure will not become a law before October 1st. Many changes have already been announced by the Finance Committee of the Senate, which has been considering the bill as received from the House. Among these changes are the placing of live stock and grain on the same basis as their products, extensive reductions in the duties on raw materials of the iron and steel industry, reductions in the chemical schedule, and certain moderate increases in the textile schedule, designed to placate the cotton mill owners of the Democratic South. It has been definitely decided that sugar and wool shall remain on the free list. In order to avoid the suspicion of hasty legislation without due consideration, the Finance Committee has sent to a large number of manufacturers a list of twenty-nine questions relating to the tariff. These questions are to be answered under oath and relate generally to the cost of production in the industry in the United States and in foreign countries from which competition is experienced, affiliation with or independence of the manufacturers with trusts or industrial combinations, percentage of labor cost to the total of production of the different commodities, and return on the capital invested. Those manufacturers who have filed briefs or made written or oral protests before the Finance Committee against the proposed duties, will have their answers to these questions printed, it is announced, if the answers are received before the bill is reported back to the Senate.

The bill, as reported from the Finance Committee, is certain to meet with vigorous opposition from Republicans and Progressives. Many amendments will be offered and the debate will be prolonged. There is no reason to doubt, however, that the majority will be able to enact their measure into law.

President Wilson has endeavored to bring pressure upon Congress by a public statement that a powerful lobby has been at work, possessed of ample funds with which to defeat the tariff bill. This announcement was plainly intended to terrify those members who are opposed to the Administration on certain duties. The Senate immediately took up the charge and a special investigation committee was appointed which has held many hearings and examined a large num-

of Michigan.

who criticise President Wilson for employing undue pressure in connection with the passage of the tariff Bill.

ber of witnesses. Nothing new or of sinister import has been brought out by the hearings. It has been shown that Senators and Representatives have been waited upon by large numbers of manufacturers and business men who are interested in the tariff bill and who have presented arguments in support of their views. Certain interests, it has been found, have maintained agents at Washington to represent them before committees and in interviewing Congressmen and Senators. Not the slightest evidence has been produced that any improper inducement has been offered to any Senator or Representative to influence his vote.

The attempt of President Wilson to overawe Congress in this matter, was not only ill advised and unfortunate, but altogether unnecessary. It savors too strongly of the Roosevelt tactics and it has not the saving grace, which Mr. Roosevelt always possessed, of force and pertinency. Senator Gallinger has retaliated sharply upon the President by pointing out that he "has come perilously near lobbying in some of the things he has done in connection with the tariff bill." It is notorious that appointments are being held up and no other explanation can be offered than the influence over legislators which these delayed appointments represent. Open threats have been made by responsible members of the Administration against any manufacturer who might reduce wages after the passage of the new tariff bill. The full power of the executive is avowedly and openly being used to force Administration measures through Congress. It does not, therefore, in Senator Gallinger's opinion, and in this we heartily agree with him, lie in the mouth of President Wilson to censure manufacturers or the agents of manufacturers for exercising the constitutional right of free speech in presenting their case to their representatives in Congress.

CANADA'S ATTITUDE TOWARDS HER RAILROADS

The annual grant of railway subsidies by the Dominion government in the Canadian House of Commons, reveals a program, the chief item of which is a grant of $15,640,000 to the Canadian Northern Railway, which is at the rate of $12,000 a mile, for the construction of 1,170 miles of railroad from Ottawa to Port Arthur, and from Edmonton to the boundary of British Columbia. There is also granted to the Canadian Northern Ontaria Railroad, a subsidiary of the Canadan Northern, the regular subsidy of $6,400 a mile for a line from Ottawa to Toronto not exceeding 250 miles. With respect to these subsidies the government stipulates that they are conditional upon the purchase by the company of all steel rails and fastenings made in Canada, and that all other material for the construction of the railways, bridges

Digitized by Google

and rolling stock shall be purchased from Canadian producers, if obtainable on as favorable terms in Canada as elsewhere.

Considering its size and resources the Canadian government has gone much further in the direction of state aid to railroads than our state and federal governments combined. The Canadian government owns and operates the Intercolonial Railroad and is building the National Transcontinental, the eastern end of the Grand Trunk Pacific. It has also guaranteed the bonds of the Grand Trunk Pacific, and many bonds of the Canadian Northern. The provinces have also guaranteed other Canadian Northern bonds. The policy of granting subsidies, in aid of railway construction, is definitely settled in Canada, and allowances, based on the cost of construction, can be counted upon with certainty.

A possible solution of the financial problems of American railways is suggested, also, in the Grand Trunk Pacific loan of $15,000,000 which was put through the Canadian House of Commons on June 4th. It provides for a 4 per cent loan, payable in ten years, and guaranteed by the Grand Trunk Railway Company as to principal and interest. In 1909 a loan of $10,000,000 was made under similar conditions and upon similar securities. The Minister of Finance explained the necessity for this loan by reference to the stringency now prevailing in the money market of the world.

We can easily imagine the reception which a proposition of this kind would receive in Congress. The American method is to regulate the railroads, to hamper them, to lay heavy burdens of taxation upon them, to cooperate with their employes in increasing wages, to raise their operating expenses by oppressive regulations, to control their systems of account keeping, reduce their rates, and control their issues of securities. After doing all these things, the state and federal governments say to the railroads, "you can now operate your property, pay your interest and make a dividend for your shareholders. It is no concern of ours how you do these things." It is no wonder that Canada's industrial development is proceeding with so much greater rapidity, as compared with the slow growth in recent years of the United States.

UNFAVORABLE ACTION ON COMMERCE COURT

On June 25 the House Democrats in caucus agreed upon abolition of the Commerce Court as a party policy, and, turning deaf ears to pleas from their leaders, rejected a plan for the creation of a budget committee to control all appropriations. Representative Broussard, of Louisiana, champion of the Commerce Court, precipitated caucus action on the mooted question by offering a resolution to authorize hearings on the Sims bill to abolish the court. Speaker Clark denounced the tribunal as useless and expensive, and Representative Adamson, of Georgia, chairman of the Interstate Commerce Committee, offered a resolution declaring it to be the sense of the caucus that the court be abolished during the present session, due care being taken to protect and provide for jurisdiction over pending and future litigation. The resolution was adopted by viva voce vote.

Contemporary Opinion

The Supreme Court Decisions in the State Rate Cases.

NO decisions by the Supreme Court in recent years have created so much interest or caused so much editorial comment, as those made public during June covering the commonly termed Minnesota and Missouri River Rate Cases. In the latter, the principles laid down in the Minnesota rate cases, were practically reiterated.

Undoubtedly, the railroads feel that they have been hard hit, as the decisions strengthen the power of states to regulate the railways within their borders in all the various ramifications which are being expressed by such regulation. This not only includes the regulation of intra-state rates, but also the conduct of the carriers in many other ways. Furthermore, the decisions are likely, unfortunately, to increase the efforts on the part of state politicians to regulate railways for the advantage of their particular communities, and the carriers will have a hard battle before they can hope to develop any well defined policy as to their rights under the law.

Undoubtedly Congress will be forced, sooner or later, to enact laws which will more largely concentrate in the National Government the power to completely regulate the country's railways, but until this is done, the recent Supreme Court decisions have greatly strengthened the regulative power of individual states and have thus complicated the situation so far as the railways are concerned.

Under the circumstances, however, it is hard to see how the Supreme Court could have acted otherwise, and while a number of newspaper editors recognize the apparent misfortune of the decisions to the carriers, none criticise the justice of the decisions or suggest the ability of the Supreme Court to act otherwise. As the Chicago *Record-Herald* puts it:

"The more the decision in the Minnesota rate cases is studied the more sound, important and truly judicious it is found to be. * * * * It points to a grave and difficult problem and tells Congress to solve it as it ought to be solved—after a searching discussion and study of all that the question involves, legally and practically. It averts the chaos of a vast twilight zone; it averts a dangerous controversy over 'judicial legislation.'

"But what of the immediate situation as regards rate regulation? What of the prospect of regulation by forty-eight state legislatures or commissions, in addition to congressional regulation? The answer is that the railroads are not left to the tender mercies of wild regulators, incompetent regulators or holdup regulators; that, in the memorable words of President Hadley, of Yale, property rights and contract rights are still protected in this country as nowhere else in civilization, and that the one thing the railroads really have to fear—confiscatory rates, the destruction of their legitimate net returns—the decision is calculated to prevent most effectually. The states may continue to regulate, and indirectly to interfere with interstate regulation, but in no case can any state legislature or commission impose an unfair and confiscatory rate. Any such rate may be enjoined and any such improper order may be annulled in the federal courts, the burden of proof naturally and properly being on the complainant."

The St. Paul *Pioneer Press* sees in the decisions a signal victory for state rights, although it points out that the Supreme Court vests no new rights and creates no new order of things, but simply restores the state rights which it held and exercised prior to the decisions of the Circuit Court of Appeals. The *Press* declares that the crux of the decision is found in the declaration that

> "The fixing of reasonable rates for intrastate transportation was left by the act where it had been found; that is, with the states and the agencies created by the states to deal with that subject."

It further points out, however, that the decision does not leave the state in full enjoyment of unlimited power. To quote:

"Its every act in connection with the exercise of its power to fix rates must be governed by reason. The Legislature may prescribe a passenger rate of two cents a mile and a maximum freight rate, provided always those rates are not confiscatory. The power which the court confirms in the state must not be abused and the railroads still have unimpaired the right to ask, on the ground of reasonableness or confiscation, a court review of any rate the state may seek to establish."

The Baltimore *Sun* believes that

"One of the unfortunate things about the decision is that it may throw the railroad-rate question back into national politics, from which it has been more or less excluded since the present broad powers of the Interstate Commerce Commission were given to that body. The Commission at present has no control over intra-state traffic, even though it may directly, as well as incidentally and indirectly, affect interstate traffic. Congress, according to the court's decision, has that power. Probably the simplest method of handling this situation would be the adoption by Congress of an amendment to the interstate commerce act giving the Commission the power which Congress itself possesses in this respect. That would be a logical extension of the Commission's authority; it would be in accordance with the theory upon which federal regulation of the railroads has been carried on in recent years, and it ought to be acceptable to the railroads."

In reviewing the decision as a whole, the New York *Evening Post* declares it to be of high constitutional importance. It says:

"Disappointing as it undoubtedly will be to the railways and to a good part of the investing community, it nevertheless embodies some consideration of positive reassurance. It affirms distinctly the power of Congress to remedy, by its own action, any inequality or undue burden which may result from state regulation of rates. It holds that the question of resultant undue preference as between separate localities 'would be primarily for the investigation and determination of the Interstate Commerce Commission, and not for the courts'—an intimation which bears very distinctly on the still pending Texas rate cases.

"Both these conclusions may be found to have

Digitized by Google

some reference to what will perhaps be the most unsatisfactory outcome of the ruling on 'reasonableness'—namely, that to permit higher rates than the state maximum to one railway in that state, while denying them to the railway's competitors, is no real solution of the practical difficulties of the situation. Finally, it must not be overlooked that this decision avoids entirely what might have been an unfortunate and unsettling outcome, in the present state of the public mind—we mean the absolute and peremptory overruling of the law-making power by the court."

The Buffalo *Commercial* asserts, there can be little doubt that the decision is a severe blow to the railroads.

"As an illustration of how the Minnesota roads are hit by the outcome of the litigation it is announced that they will have to rebate to shippers about $3,000,000 in overcharges collected since the law was enacted. Other states which have rate cases pending will find them sustained wherever the principle of confiscation has not been violated, and encouragement will be given to other commonwealths to enact two-cent rate laws and thus virtually upset interstate commerce rates."

Summing up the influence of these decisions, the New York *Commercial* has the following to say:

"By its long deferred decision in the Minnesota rate case the United States Supreme Court has handed the railroads of this country over to the tender mercies of the various states of the Union which can now go as far as they please, so long as what they do to the railroads does not amount to confiscation. It is true that the court points out ways in which Congress can come to the relief of the railroads and protect them from state aggression. At present Congress seems no more inclined that way than the various states so the prospect for such relief is much like a pleasant dream.

"The court holds that the states have practically unlimited power to regulate intra-state commerce but must not interfere with interstate traffic. As far as passenger rates are concerned, in practice the minimum state rate will have to be part of the through rate. If the railroads do not sell through tickets at the minimum rate passengers will simply buy tickets to the state border and then pay the local rate for transportation across or into the state that has set its passenger rate below that allowed by the Interstate Commerce Commission for interstate traffic. The railroads cannot squirm out of this, as experience with the two-cent rate fixed by the charter of the New York Central has proved. Getting cut rates on freight traffic will be more complicated but large shippers will work out schemes to secure them on the same principle.

"This judgment also gives to the state power to compel the railroads to make local improvements and to order them to adopt protection measures of a reasonable character in the interest of the health, safety, morals and welfare of the people of the state, although interstate commerce may be involved. This gives the states the power to pass 'Jim Crow' laws and is a notable victory for state rights.

"The California Railroad Commission will now have the Southern Pacific at its mercy and the case will have a direct bearing on the settlement of the Union Pacific case."

Finally, Professor William H. Taft, of Yale, has analyzed the railroad rate decision of the Supreme Court and in a statement contributed to the New York *Sun* expresses the opinion that on the whole the finding of that high tribunal inclines in favor of the railroads. Summarized, Professor Taft, in this statement, thus puts the grand effect of the decision:

"The result of the main issue is a great victory in principle for the national control of interstate commerce and the possession by Congress of the right to use every appropriate means to render that control effective and uniform, even where the means may include an investigation and restriction under Congressional authority of state fixed rates on state business."

We might add, however, that, for obvious reasons, there is little immediate comfort in such summarization, whatever it may hold out for the future.

Developments in the Rate Situation.

IN another section of this issue is published a statement recently made by R. H. Edmonds, editor of the *Manufacturers' Record*, of Baltimore, regarding the railway situation in the South and Southwest. Any statement by Mr. Edmonds on the railway situation, representing, as he does through his journal, thousands of important shippers throughout those sections, is of unusual significance; and his vigorous stand for the adoption of some policy whereby the railways may be permitted to increase their net income, is a hopeful indication that those who patronize the railways are recognizing, in a fuller sense, the vital influence upon the success of their business, of an adequate and progressive transportation plant. The following is from an editorial which appeared in the *Manufacturers' Record* of June 19:

"The railroads of the country, by force of public sentiment and of economic conditions, have been compelled year after year to increase the rate of wages of their employes; nearly everything they have had to buy, from oils to locomotives, has been advanced in price; indeed, the 'high cost of living' is just as vital to every railroad in the country as it is to every individual. It is costing more to operate railroads, more to equip them, more to provide the facilities which the public demands. They are practically being regulated out of existence without the privilege of increasing their income to a sufficient extent to save themselves. Unless a complete change comes about in the very near future and railroads are given the privilege of making larger earnings by higher rates, this country will be compelled to see a complete breakdown of the whole railroad system of the land, or else to take over all of our railroads, with the enormous indebtedness which that would bring about, and the utter collapse of our system of government which would follow. The stone wall faces us. We cannot butt it down; we cannot crawl underneath nor climb over it. We must find a way to remove it. That stone wall is the misunderstanding of the railroad situation which has existed throughout our country for some years. Too many people have been made, by honest but misguided men and by dishonest demagogues, to believe that they and the country would get rich by destroying the railroads, or by reducing freight and passenger rates to the lowest possible limit. This hostility

Digitized by Google

is largely due to the conditions which prevailed in the railroad world fifteen or twenty years ago, when the building of speculative railroads for the purpose of carrying securities, rather than for the carrying of traffic, was the order of the day. Long ago we passed out of that period, and for many years most of the railroad managers of this country have been earnestly striving to operate railroads with just as much honesty as private business interests are managed. They sought to find a way to give to the public the improvements demanded for freight and passenger business. They have seen and realized more than any one else the difficulties which confronted them. They have seen the lessening of their ability to increase their facilities in keeping with the growth of the country. The public, however, has not yet come to a full realization of the danger of the situation that exists to-day. It does not yet fully understand how a breakdown of the railway system of the country would demoralize every industry and interest in the land. Too many people, otherwise intelligent, have failed to recognize that transportation business would be destroyed, wealth would disappear, and stagnation of industry would take its place.

"We are hastening to the time when every interest in the country will be endangered and losses produced which will run into billions unless we can find a way to put our railroad interests on a sounder and safer basis, where their income can be increased and when the $8,000,000,000 or $10,000,000,000 that ought to be spent upon railroad expansion in the next ten years can be provided. This is not a theory. We are face to face with facts of tremendous significance. We can only save ourselves and our business interests by finding a way to vastly increase railroad earnings and to put railroad securities on some safe and sound basis that billions of dollars may be poured into investments in the building of new roads and the expansion of existing lines. Unless we do that we shall see, as surely as we see the sun rise, a breakdown of business because of a breakdown of the machinery of doing business, viz., transportation."

The Philadelphia *Public Ledger* calls attention to the necessity of giving the widest publicity to the requirements of the carriers. It sees in such plan the only method whereby the present situation can be properly met. It says:

"It is not likely that the railroads will take us to heaven, but they will transport us to other desirable places, and their condition—material, political and financial—is the working basis of the nation's business. They are to-day the biggest, most intricate and most vital problem in American affairs.

"But the men who are legislating on these railroads are like the laborers of Babel, and while legislatures are full of speeches and new laws, the railroad fabric remains incomplete. The courts are trying to straighten out the tangles and clear the way for more intelligent action, but we fear that our statesmen, or those who are where statesmen should be, are not studying railroad questions.

"So, to-day the railroads are suffering from the calamity of ignorance. There is need of a campaign of education, not of mere agitation or fault-finding or appeal, but of downright, direct, sane informing, teaching of the fundamentals of the whole business. In this way alone may wise laws be obtained, and until we get these wise laws, transportation will be uncertain of itself and business will be constantly muddled."

H. S. Priest, of St. Louis, who was recently appointed attorney for the receivers of the St. Louis and San Francisco Railway Company, telegraphed the following statement to the New York *Sun*:

"The railroads are in a peculiar situation. The price of everything that enters into the cost of operation, including taxes, has increased. The price of commodities they haul has increased. They have not been allowed to advance the price of transportation.

"If these great arteries of exchange and distribution ars strangled or starved to death the result must inevitably be disastrous to every other business.

"The trend of legislation has been and is to protect private capital until it is invested in railroads, when it ceases to be private capital and becomes property subject to legislative exploitation, both state and federal.

"Under such conditions no one is anxious to invest money in any form of railroad securities and does so only under speculative conditions or in taking the gambler's chance.

"All business is in a halting attitude because all business seems to be more or less the subject of legislative control. This discourages enterprise and progress.

"Business needs emancipation from legislative influence. It has been pursued until it is a nervous wreck.

"Railroads must be managed by their owners. They must be owned either by the Government or by private persons. If owned by the former its ownership gives it the right to deal with them as it please. If owned by private capital it must be allowed to manage them as it may please, subject only to the obligation to give adequate service at a price which is reasonable for the service rendered, without regard to the profit which the owners may make in rendering such service.

"Any other rule of trade will in the end be disastrous to the country because dishonest and immoral."

Financial America asserts that railroad development commensurate with the growth of the country's business, is certain to be retarded, if not definitely postponed, if the railroads are not permitted to increase their rates. In commenting on the views of an English authority, it says:

"Sir George Paish, the eminent financial authority and editor of the London *Statist*, says that one of the reasons for distrust concerning American securities abroad is attributable to the failure of the Interstate Commerce Commission to permit our railroads to increase their freight rates. This view is decidedly interesting and coming from one whose perspective is measurably lengthened, should be regarded as more or less unbiased. It is true that the question of railroad compensation for service to the public is dealt with more liberally in England than in this country. This is clearly established by the recent Parliamentary sanction for rate advances by British railroads, while the situation in this country is the reverse."

Below are a few points which are worthy of the consideration of every man, says Frank W. Tupper in *Moody's Magazine*. Perhaps they may

Digitized by Google

show the causes that brought to the railroads in 1912, the lowest relative net income in 25 years, although the gross income was the largest ever received.

First. Railroads have been built by private capital, and such capital has a just right to a legitimate return on the investment;

(a) Even though the character of the service be of a public nature.

Second. Railroads are not allowed to sell their product (transportation) at a price which they deem reasonable;

(a) But are held down by legislative rulings and rate laws.

1. In 1912 the Interstate Commerce Commission handed down 375 rate decisions 65 per cet of them granting reductions, and 35 per cent dismissing complaints, but not one raising rates.

Third. Railroads cannot buy labor, the chief factor in their cost of operation, in the cheapest market, but must buy from certain bodies of men, which are so strongly organized, that they can, and do, enforce its demands;

(a) They cannot refuse to buy such labor, as the continuous operation of a raiload is so vital to a country, that its cessation would result in a great financial loss and actual physical suffering;

1. During the past twelve months the locomotive engineers and firemen in the Eastern territory alone, by threats of strikes, succeeded in getting an increase in wages by arbitration of around $5,000,000, which means that a charge equal to a high rate of interest upon $100,000,000 must be met before even bond interest is paid.

2. The railroad trainmen are now negotiating for a substantial increase.

Fourth. Railroads are subject to drastic legislation involving expense with no appreciable return;

(a) New York's full crew bill resulted in an apparently unnecessary increase of operation of $2,000,000 annually.

(b) New Jersey's full crew bill has same effect.

(c) New Jersey's grade crossing bill provides that

1. All expenses of abolishing grade crossings shall be borne by the railroads. This will result in an estimated outlay by the Pennylvania Railroad, alone, of $60,000,000 with no increased income.

Fifth. Railroads pay high and increasing taxes;

(a) There has been an increase of 178 per cent per mile in twenty-four years although capitalization has increased only 20 per cent per mile.

(b) Of earnings 4.21 per cent was paid in taxes in 1912, as against 2.89 per cent in 1889.

Sixth. Railroads in United States are not over capitalized;

(a) Capitalization per mile of line.

1.	United States	861,508
2.	England	275,354
3.	Germany	113,326
4.	France	143,648

Seventh. In states where a physical valuation has been made by the state the valuations have exceeded the value of capital securities;

(a) This has been true in the states of Washington, Minnesota and Wisconsin, while South Dakota showed a capitalization practically equal the cost of reproduction.

1. The New York, New Haven and Hartford and Lehigh valley have disinterested appraisals showing low capitalization to replacement value.

Eighth. Railroads do not earn excessive dividends;

(a) In 1912, 3½ per cent was the average return on stock of all roads.

1. In Eastern territory less than one half paid as high as 6 per cent—while 25 per cent paid no return of capital.

Ninth. It is necessary for the railroads to make certain improvements from their surplus accounts, as non-earning expenditures cannot be capitalized. Steel cars, safety devices, modern stations, reduction of grades, etc., all tend toward greater comfort and safety for the public but the necessary expenditures for these purposes do not result in greater earning power.

Attention was called in last month's issue to the liberal attitude on the part of the Canadian Government towards its railroads as compared with that of the United States. The New York *Journal of Commerce* commenting editorially on this phase of the situation, says:

"The Dominion of Canada and its Western provinces are still engaged in a liberal policy of subsidizing railroads for the development of the 'great West' of that part of the continent. It appears from figures of the Finance Minister that the general Government has guaranteed bonds of the Canadian Northern Railway and affiliated lines to the amount of $58,000,000 and the provinces west from Ontario have added enough to make up an aggregate of more than $120,000,000, while the securities issued without guarantee amount to something over $145,000,000. Besides this the Dominion Government has already granted and paid over a cash subsidy of $8,000,000 and a further subsidy of more than $15,500,000 has been carried through the lower house of the Parliament at Ottawa."

New Records in Aerial Flight.

THE Philadelphia *Press*, in commenting recently upon the progress which is being made in aerial navigation, has the following to say

"Its practicability grows clearer as we note the increasing attainments of the air-men in point of speed, distance, endurance, altitude, and comparative safety. Last Monday, for instance, the veteran pilot, Count Zeppelin, with three others in the dirigible 'Sachsen,' paid a visit to the Emperor Francis Joseph at Vienna by flying from Baden-Baden 430 miles away in eight hours at the rate of fifty miles per hour. Though the 'Sachsen' is not considered the speediest airship, yet on this occasion it made a new record. As if not to be outdone, the very next day the French aviator, Marcel G. Brindejonc des Moulinais, in competing for the Pommery Cup—beat all previous aeroplane records by flying from Paris to Warsaw, a distance of 933 miles, in thirteen hours. He covered a stretch 674 miles in seven hours and four minutes, which approaches the two-mile-a-minute pace and through the entire voyage equals the speed of the fastest locomotive 'express.' This is the swiftest flight made between sunrise and sunset, outdoing the remarkable achievement of his rival, Ernest F. Guillaux, who a short time ago flew from Biarritz to Kellum, Holland, a distance of nearly a thousand miles.

"Previous to this, in April last, Gustav Hamel took a passenger in his aeroplane from Dover, England, to Cologne, Germany, reeling off 245 miles in 258 minutes, and a few weeks earlier M.

Digitized by Google

Perreyon in a 'Bleriot' monoplane had reached an altitude of 19,685 feet. Records of this character arouse lively conjecture as to the possibility of accomplishing the much-coveted transatlantic journey into which enter all the factors thus put to the test. Under present conditions involving fuel supplies a machine is capable of carrying, the flight must be continuous, and at sixty miles an hour it would take thirty hours to cover the 1,800 miles from Newfoundland to the Irish coast. This speed has been exceeded for a third of the time mentioned.

Under the regulations laid down by the London *Daily Mail* which offers a prize of $50,000 for transatlantic flight, seventy-two hours are the limit. No aero motor yet produced is equal to such endurance, but the machine of best promise is the powerful hydro-aeroplane recently exhibited at the Monaco meeting held at the beginning of last April. With the many mechanical improvements being rapidly evolved and growing confidence in the face of stormy weather, it looks as though in the near future some aerial navigator will cross the herring-pond over the funnels of the big liners."

Physical Valuation.

THE Boston *Transcript* in commenting on the progress being made in the physical valuation plans, has the following, in part, to say editorially

"In a conference between the Interstate Commerce Commission and a committee representing fifty-five railroads, the ground has been cleared for beginning the physical valuation of our transportation system, recently ordered by Congress. It is a hopeful sign that the conference resulted in an agreement for mutual assistance. The carriers were directed by Congress to co-operate with the Commission in ascertaining the physical valuation of railroads, but the aid they will render will not be compulsory. Railroad managers at one time may have been indisposed to welcome a federal inquiry to ascertain the true value of their real tangible property, but to-day, as a class, they probably see that a schedule showing the enormous amount of land and material required for their business would be an admirable argument for liberal treatment by federal authority.

"The general impression, of which railroad-baiters have taken the utmost advantage, is that our railroad system has been greatly over-capitalized, and that it is greatly over-capitalized to-day. Unquestionably there was an era of wild stock-watering just as there was an era of wild expansion, but with the development of railroads to meet the public demand, and with the growth of the country, transportation lines as a whole have more than overtaken any excess of capitalization. Such at least is the belief of many who are in a position to judge dispassionately between what the public demands and what the railroads can give without increasing their financial obligations. A railroad is never finished. Work is going on night and day. The normal labor is for repair and replacement, but the demand of commerce and trade compels expansion of equipment and facilities."

Baiting the Railroads.

THE Buffalo *Commercial* editorially calls attention to the fact that Attorney General McReynolds is practically insisting that the Union Pacific Railroad shall sacrifice its $126,000,000 of Southern Pacific holdings in order to comply with the Supreme Court decision that the interests of the two transportation companies shall be completely segregated. It calls attention to the fact, that while the order of the court must be obeyed, the plans of the Union Pacific have been largely thwarted in one way or another, on account of the opposition of the Government under the new Administration. Commenting on the attitude of many government officials and others towards the railways, the *Commercial* says

"Of course, the railroad is a fair target for everybody, but the Attorney General shows a brutal callousness to the interests of thousands of innocent stockholders when he advances any such argument as this. The railroad company when it acquired the interests of the Southern Pacific believed it was acting within the law. It was so advised by competent legal authority. There was no conscious wrongdoing upon its part, and not until after the Northern Pacific Securities decision was the illegality of the merger seriously questioned. If the sacrifice demanded by the Tennessean is forced, if the pound of flesh is exacted, it will involve the stock market and add to the troubles that now beset Wall Street. With railroad rates all over the country at sixes and sevens as the result of the Supreme Court decision in the Minnesota rate case, with the operating expenses of the railroads increasing by leaps and bounds, with the railroads hampered and harassed by the Government at every turn, it is high time to call a halt. Unless the policy of nagging the rail carriers is ended soon, the country will suffer the most disastrous consequences, because it is impossible to injure the largest single business interest in the country, the largest consumer of manufacturing industry and the largest employer of labor, without involving all in a common disaster."

Alexander Forsyth, superintendent of shops of the Chicago, Burlington & Quincy, at Aurora, Ill., died on May 19th, at the St. Charles Hospital, Aurora, aged 68 years. Mr. Forsyth was born in April, 1845, in Cumberland County, England. His entire railway service was with the Chicago, Burlington & Quincy, with which road he commenced work in 1869 as a machinist. From October, 1880, to October, 1881, he was general foreman at Beardstown, Ill., and then became master mechanic at that point. In January, 1887, Mr. Forsyth was transferred to Aurora as master mechanic, which position he held until March, 1906, when he was appointed superintendent of shops.

George B. Francis, M. Am. Soc. C. E., a well known former civil engineer in the railway service, died at his home in New York City, June 9th, at the age of 56. He was born at West Hartford, Conn., and was educated at the Hartford High School. He was the first chief engineer of the Boston Terminal Company, and the South Station at Boston and the Union Station at Providence, were among the most important works carried out by him.

John Jacobs, former roadmaster of the Illinois Central Railroad, died in Chicago, June 6th, aged 87 years.

The Financial Requirements of the Railroads

NOTE. Richard H. Edmonds, editor of the *Manufacturers' Record*, published in Baltimore, has recently completed a six-week's trip through the South and Southwest during which he made a special study of railroad and business conditions. In a statement published in the *Baltimore Sun* he asserts that "One of the greatest problems before this country is how to meet the need for a great expansion in railroad facilities to keep up with the growth of the country." For many years the *Manufacturers' Record* has been closely identified with the industrial developments of the South and Southwest and has represented in a larger way than any other journal, the business interests in those sections which have annually contributed an enormous tonnage to the railways. The conclusions which Mr. Edmonds has reached, as expressed in the following paragraphs, are a hopeful indication that shippers are more fully appreciating the problems confronting the carriers.

THE railroad traffic of this country practically doubles every decade. The magnitude of our railroad business is seen in the fact that the Pennsylvania Railroad hauls a greater tonnage than that of all the railroads in England, Ireland, Scotland and Wales, and on the average hauls it three times as great a distance, so that on the ton mileage basis the Pennsylvania Railroad hauls three times as much freight as all the railroads of the United Kingdom.

The traffic on the United Kingdom roads increases slowly as compared with the traffic in this country, and it is estimated that the traffic on the Pennsylvania will double in the next ten years. Similar conditions prevail throughout the country.

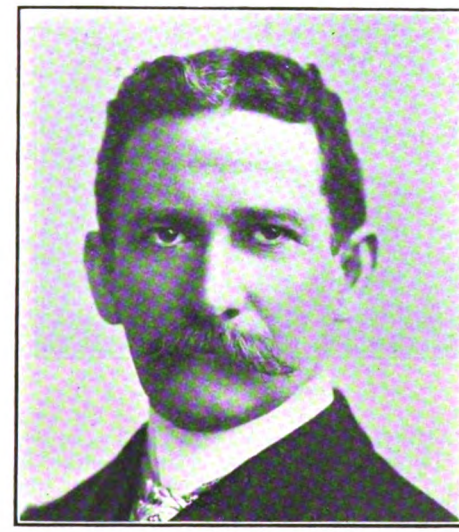
To increase the railroad facilities rapidly enough to keep up with the growing traffic needs of the country would require an investment of at least $7,000,000,000 to $8,000,000,000 within the next five or ten years, in addition to the usual amounts expended for betterments and increased rolling stock. If we are to double our railroad traffic in ten years, we ought certainly to increase our transportation facilities in that time to 50 per cent or more and take care of the still larger volume by increased motive power, larger cars and heavier rail equipment.

Where so vast an amount of money is to come from is a question which confronts the financial interests and the railroads of the country. No answer to the question is in sight, but if the money cannot be provided, then the volume of traffic will be so far ahead of the facilities for handling it that the railroads five or six years hence will be wholly inadequate to meet the emergency, and the machinery of transportation will break down except on the best roads in the country, just as it broke down in 1907 and helped to bring about the financial conditions of that year.

Persistent agitation against railroads has made it practically impossible to raise money in large amounts for railroad building and betterments. Fortunately there is now seen throughout the country—and this is noticeable even in the States where the most pronounced agitation existed—a kindlier feeling to the railroads and a recognition of the fact that, like the Siamese twins, the roads and the people are so closely connected that one cannot suffer without the other suffering and one cannot prosper unless the other is prosperous.

The people of the country at large are even more vitally interested in the enlargement of transportation facilities by enormous expenditures of capital than are the railroads themselves, because the people are greater in number than the stockholders of railroads.

There is a growing realization throughout the South and Southwest of a need for large railroad expansion and for the betterment of existing lines. The railroad people have seen this condition and have been doing all in their power to meet it, but the money has not been available to carry out improvements on the scale demanded in order to reduce the cost of handling traffic and take care of the great increase that is ahead of us. On a good many roads the physical condition of the roadbed and rolling stock cannot be maintained at the highest state of efficiency because of this scarcity of money.



RICHARD H. EDMONDS.

On other roads, important extensions, where an abundance of traffic would be immediately available, cannot be made for the same reason. With our increase in population, running now to eighteen to twenty million people in the next ten years, and the growth in trade and traffic far larger proportionately than the increase in population, the whole country is brought face to face with the great problem which the railroad people have foreseen—of inadequate transportation facilities to handle business. Many Southern and Southwestern roads are making very considerable improvements.

During the last five years not far from $1,000,000,000 has been spent in road building and the betterment of roads of the South and Southwest: but even this vast sum has merely enabled the roads to keep from falling behind; it has not enabled them to push their development ahead looking to the future.

The Increased Cost of Operation*

By GEORGE D. DIXON,
VICE-PRESIDENT, PENNSYLVANIA RAILROAD.

GEORGE D. DIXON.

RAILROAD managers feel, and I believe the business men of the country concur, that the great transportation interests must continue to develop. With the growth of traffic which will naturally follow, greater terminals, more tracks, and a large increase in cars and locomotives will be necessary to handle the business.

In the passenger service, it is necessary that the public should have the fullest measure of safety and comfort which the railroads can furnish. This means the removal of grade crossings, the installation of automatic signals, and the construction of all-steel cars. All of these things have to be paid for and for that purpose capital must be raised. If the investor is not assured of a safe return on his money, he will not supply the capital for our purpose; he will put it elsewhere, either in this country or in some other part of the world. If the investor will not supply us with new money to finance the improvements which are required, those improvements cannot be made and the public and shippers cannot be supplied with proper facilities. The money must come from somewhere, and unless conditions can be made such as to attract that money, both the railroads and the public they serve will suffer.

For the above general reasons, the railroads in the Official Classification territory, as a whole, feel it to be necessary for the future welfare of these great transportation interests, and have petitioned the Interstate Commerce Commission to reopen the advance in rates case of 1910, known as Docket No. 3400, asking for a general increase of five per cent, with a reasonable minima per one hundred pounds and per ton, in all rates both class and commodity. It is the intention of the railroads to maintain the usual port differentials, and the percentages and territorial groupings, so that with an advance of five per cent there will be no material change in the relative rate adjustment as between communities, in effect to-day.

In so far as the Pennsylvania Railroad Company is concerned, we do not plead poverty or pressing danger. There are many railroad companies, however, to whom this increase is a vital necessity. The position of the Pennsylvania is that an increase is not only warranted but necessary, to enable it to continue giving adequate service to the public.

Our company has not been paying large dividends to its shareholders. The policy has been to pay a reasonable dividend and to regularly put a fair share of earnings back into the property. If all the money which has been put into the property of the Pennsylvania Railroad Company had been supplied by investors, they would to-day be earning but 4.83 per cent on their money. At this moment it would be absolutely impossible to find new money if that was all the return that it could be expected to yield.

Though at the moment our company is in strong financial condition, our records show that for several years past certain very definite tendencies have been at work. These are:

1. A steady increase, partly forced and partly warranted, in the rate of wages. Our wage payments are now at a rate of 37.1 per cent higher than in 1900.

2. A persistent increase in the ratio of cost of operation to total earnings. In 1900, for every dollar we earned, it cost us (including taxes) 67.73 cents to run the road. For every dollar received in 1912, it cost us 78.09 cents for actual operation.

This increase in operating expenses is due not only to the increases in wages and taxes, but also to the fact that the railroad is compelled to employ a constantly greater number of men relative to the work to be done. This is indicated in the cost to the Pennsylvania Railroad East of Pittsburgh alone of extra crew laws, as follows:

	Estimated Annual Cost.	Names of States.
	$591,805.69	in Pennsylvania.
	20,611.40	in Maryland
	144,373.08	in New Jersey.
Total	$756,790.17	

Up to January 1, 1913, and since August, 1906, our company had paid out $10,936,134.90 to comply with new laws, Federal and State. These laws may have been desirable. This is not the place to discuss that point. At any rate, they are imposed upon us by public authority and we must comply. The public has the right to impose any burdens it pleases upon railways, but it is palpable that the cost must be met by somebody.

3. A third tendency is toward an unyielding increase in the cost of capital. This is a tendency noticeable throughout the world. The general in-

*From remarks at a meeting of the Pittsburgh Chamber of Commerce on June 6th, 1913.

Digitized by Google

terest rate is going up, affecting the price of government bonds and securities of all kinds. Railroads must pay more for their money.

Now, with the cost of handling business steadily encroaching upon the receipts from that business, it is evident that we are approaching a danger point. We feel that we ought, as a matter of sound policy, to be permitted to earn a greater margin between income and outgo. This is absolutely essential if we are to be able to raise the capital to finance our requirements in the next few years.

These requirements, bear in mind, are not for ourselves only, but that we may give shippers and passengers the increased and high class service they have a right to expect. We estimate that on the Pennsylvania Railroad system in order to do our duty to the public, we must spend within the next few years very large sums of money for additions and improvements. The problem will be how to raise that money, and in solving it we must have the co-operation of the shippers and the public generally.

Our prosperity is your prosperity, and vice versa. The public should insist upon having the railroads handle its business at reasonable rates. But given reasonable rates, it is to the public's interest that the railroads earn all the money possible with which to give increasingly good service to the public and pay reasonable dividends.

The case is very simple. There is no mystery about it. It is for the Interstate Commerce Commission to settle the merits of the case, but we feel that the shippers and the public are entitled to know the why and the wherefore of what we are asking the Commission to do.

The Railroads' Attitude on the Rate Question

PRESIDENT DANIEL WILLARD, of the Baltimore and Ohio Railroad System, who is chairman of the committee of presidents, in presenting before the Boston Chamber of Commerce, on Thursday (June 12), the railroads' position in the matter of the application for an increase of 5 per cent, in freight rates, reviewed briefly the history of the application made by the railroads in 1910 for an increase in freight rates, which was at that time deemed to be necessary because the higher wage schedules which had been granted to employes, the increased cost of materials generally and expense incident to legislative enactments had so narrowed the margin between income and outgo that the net earnings were, in their opinion, insufficient to enable the maintenance of the properties in satisfactory condition and to provide the improvements and additions that the growing commerce of the country constantly demanded. At that time, Mr. Willard stated, the railroads failed to establish in the minds of the Commission the necessity for increased rates. The Commission also suggested that even if the necessity had been established, it was doubtful if the plan proposed, which contemplated increases varying from 8 to 20 per cent in certain class rates was the right or best way in which to obtain such revenue. Further, that there had been a general depression of business at that time, and the carriers ought not to expect to raise their rates when business was dull.

Mr. Willard pointed out that the rates which were in effect in 1910 had not in the aggregate been maintained. He cited as an example that the net result to the Baltimore and Ohio Railroad of various changes in rates since 1910 was a reduction in earnings on the freight business handled by the company in October, 1912, of more than $100,000 and it was estimated that for the year such decrease would amount to not less than $800,000.

Not only had the general basis of rates been lowered to some extent by orders by regulating commissions, and perhaps to an equal or greater extent by commercial conditions and influences beyond the power of the carriers to resist, but during the same period expenses had also greatly increased.

Mr. Willard said: "Again in the case of the Baltimore and Ohio, the wage increase of 1910 amounted to approximately $2,500,000 a year, and the increases which have been granted—either voluntarily or by virtue of arbitration awards—within the last twelve months have resulted in adding over $800,000 more to the expenses each year. Further, as is well known, the conductors and trainmen are now engaged in taking a strike vote for the purpose of enforcing their demands for an advance of approximately 17 per cent, and while it is not likely that they will obtain all they ask for, it is probable that if the matter should go to arbitration under the provisions of the Erdman act, as it now stands, that they would receive a substantial increase.

"Prices of various kinds of material have also advanced since 1910. The coal bill of the Baltimore and Ohio Railroad amounts to approximately $6,000,000 per year, and within the last two years there has been an advance in the price of coal upwards of 10 per cent. The increase in price of ties has also been considerable. Prices asked and paid for locomotives, freight and passenger cars are also higher to-day than was the case three years ago for equipment of the same kind.

"Legislation of various kinds—both State and Federal—has had an important influence upon expenses. The so-called full crew bill, which has become a law in many of the States, requires the railroads to employ an extra man on all trains of more than certain length, regardless of the local conditions.

"The hours of service law, boiler inspection laws, laws in various States prescribing standards of construction for caboose cars, laws with reference to the construction of postal cars, revised orders with reference to safety appliances upon new equipment, as well as upon existing equipment; laws with reference to grade separation, etc., all have tended to very greatly increase the cost of operation. It is not my purpose, at this time, to question the wisdom of any of the laws referred to, because, regardless of whether they are wise and necessary, the added expense is there and must be paid.

"Taxes have increased largely during the last three years. In the case of the Baltimore and Ohio Company the increase in that one item since 1909 amounts to more than $900,000 a year. I think it is perhaps not a matter of common knowl-

Digitized by Google

edge, although one of public record, that the American railroads, as a whole, pay each year in taxes more than $120,000,000, a sum nearly two and one half times as much as the total amount received by all the railroads for carrying the mails."

Attention was also called to the fact that the interest basis on all investments had been raised within recent years and that the very best securities must now pay higher rates than ever before, that while the railroads were not peculiar in this respect, they were in common with others required to pay a much higher rate of interest than was the case five or ten years ago, and that this item was very important, particularly with the large systems, upon which millions of dollars are being spent, and should be spent, each year for additions, betterments and new equipment made necessary by the growing demands of the constantly expanding commerce.

Mr. Willard also stated that the public demands, expects and receives a higher standard of service in all directions than has ever been the case before. "While no one recognizes better than the railway managers that the service is not always satisfactory and is frequently not such as they would like to furnish, I believe," said Mr. Willard, "it is nevertheless a fact that upon the whole it is on a more satisfactory basis to-day than ever before, and that this was accomplished only by means of greater expense in operation."

In summing up conditions, he continued:

"The various influences which I have mentioned have all tended to further reduce the margin between income and outgo, and it has become so narrow that the railroads—many of them, at least—do not feel justified in further increasing their capital account, regardless of the rates at which money may be obtained, because the burden assumed by so doing might seriously interfere with their ability to maintain reasonable payments upon their capital issues already existing."

Mr. Willard cited Mr. James J. Hill's estimate made in 1908, that the railroads of the country should spend not less than one billion dollars a year for betterments and equipment and quoted figures showing that the actual expenditures during the past four years had been only at the rate of $511,000,000 a year, or about one half of Mr. Hill's estimate. The same reports also show that the net earnings of the railroads for the year ending June 30, 1911, after paying operating expenses and taxes, were actually $8,787,000 less than they were in 1907, and before the additional $2,000,000,000 had been expended, and the percentage of return on cost of road and equipment in 1911 was only 4.97, as compared with 5.82 in 1907.

The report of the Federal Census was quoted to show that during the previous decade capital invested in agriculture had increased 100 per cent; in manufactures 105 per cent, while capital invested in railroads during the same period had increased but 40 per cent, and that one result of this disparity of investment was to place manufacturing industries, when measured by the amount invested, second only to agriculture and in the position previously occupied by the railroads.

"If I am not mistaken in my understanding of the general situation," said Mr. Willard, "and if I have stated it as it actually exists, it would seem that we all must agree that we are confronted with a serious condition, and one worthy of the careful and dispassionate thought of every one interested in the development of our country. Granting for the sake of argument that the situation is substantially as I have stated, it seemed to me that the most important question next to be considered is, how can the matter be adjusted and that, too, for the best interests of all concerned, including not only the railroad bondholders, shareholders and employes, but also from the standpoint of the manufacturer and consumer, because in the last analysis the consumer is the one who will ultimately pay the freight.

"Three years ago the Commission said that the railroads had failed to establish a necessity for increased revenue. I believe that necessity is apparent to all at the present time. They suggested that the plan then proposed was not the right one, and with that suggestion the railroads now agree, and have proposed another method which seems under all the circumstances to be fair and equitable. It was also suggested that if the rates were to be raised at all, it should be done when times were good, and upon the whole, business was never better than it is at the present time."

In this connection Mr. Willard explained that it was now considered better to obtain, if possible, the necessary advance in rates by a percentage uniformly applied to all items; and while it was believed in view of all the circumstances the increase should be not less than ten per cent, that desiring to obtain the necessary relief in a manner that would cause the least possible disturbance of existing commercial conditions, it was concluded to ask permission to make a five per cent advance only; and that should it develop later on that the relief so obtained was not sufficient, the matter could be given further consideration in view of conditions then existing.

Mr. Willard then continued:

"It is believed that the increased rates proposed are fair and reasonable when considered in connection with the operation and requirements of the three railroads—the New York Central, Pennsylvania and Baltimore and Ohio companies—specifically referred to by the Interstate Commerce Commission in its decision in the 1910 rate case No. 3400, and it is urged that if the rates are reasonable when so considered, they ought not to be withheld simply because they might result in greater earnings on the part of some other carrier, than would be justified when considered of and by itself.

"I wish to say just a word with reference to the general railroad situation. There can no longer be any doubt that the public has ample and efficient machinery for the thorough control and regulation of the railroads. We not only have a federal commission in Washington which has been granted the widest possible powers to regulate and supervise, but we have also commissions in nearly all of the individual States, with powers relatively as great as those delegated to the federal body. The Interstate Commerce Commission is empowered to prescribe the manner in which the railroad accounts shall be kept, even to the minutest detail and the railroads are now keeping their accounts in harmony with the requirements of the Commission. It is also provided by law, under penalty of heavy fine and imprisonment, that no discrimination shall be shown either with reference to rates paid or service given, as between individuals or communities.

"It has come to be understood that the rail-

Digitized by Google

road is a semi-public institution, and that it is expected to treat all with equal fairness. The executives in charge of the railways, by virtue of what has come about, occupy the dual position of semi-public officers, charged with the duty of operating the properties in harmony with the laws of the country and also with the equally-important duty of trustee, representing those whose money is invested in the enterprise. It should be remembered that although the railroad is considered a public utility with important public functions to perform, it nevertheless owes its very existence to the employment of private capital, and Mr. Commissioner Prouty has well said in one of his public addresses that 'we can provide by legislation the sort of cars which a railroad shall use and the rates which it shall impose; we cannot by legislation force one single dollar of private capital into railroad investment against its will.'

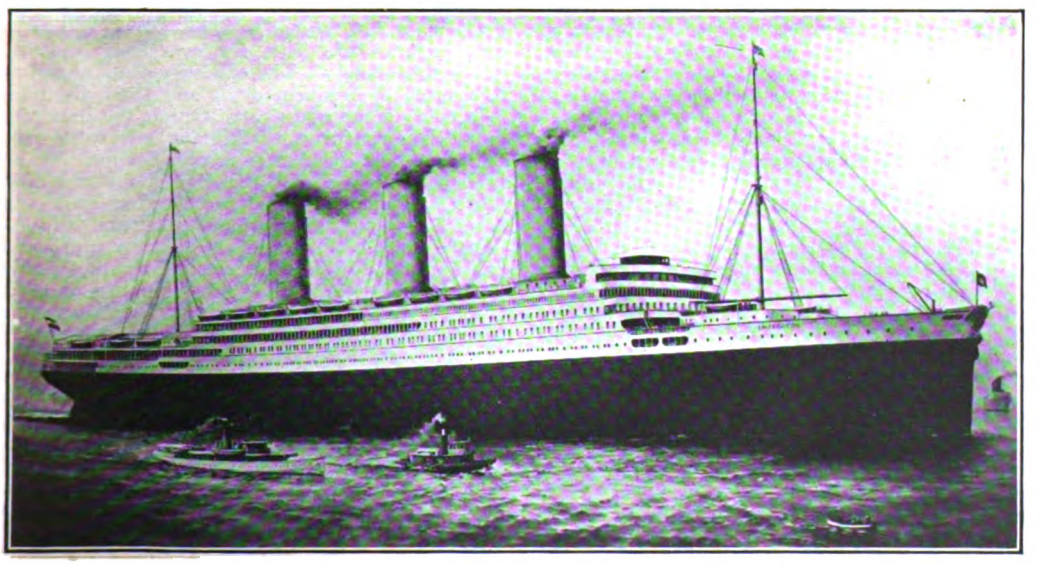
"Those who to-day manage the railroads are chiefly men who have devoted the greater part of their lives to that service, and will not as a rule be personally affected one way or the other by the outcome of this movement. They appreciate fully their obligations to the public, while at the same time not unmindful of their duty as trustees, and I should personally feel that I had failed absolutely to measure up to the requirements of my position if I felt as I do about the situation and remained silent. I feel it incumbent upon me as the chief executive of the Baltimore and Ohio Company to do what I can to bring the situation as I see it clearly before, not only the Commission, which in the end will decide the question at issue, but also before those who are vitally interested in the proper solution of this problem. Should the Commission, however, after a full hearing, decide again against the contention of the carriers, I at least—and I am sure I can speak with equal clearness concerning my associates—shall continue to do the best that I am able to meet the requirements of the situation, but it ought to be clearly understood that in that event the policy of cheapness instead of quality, which the railroads have already been obliged in a measure to adopt, must of necessity be continued, and I cannot believe that the American people want their railroad system run permanently on that basis."

The World's Largest Ship

THE S. S. Imperator, the new marine wonder, which reached the shores of America about the middle of June, opens a new chapter in marine history. The great liner is not only the largest ship in the world, but establishes new standards by the completeness of her mechanical equipment, her safety devices, and the variety and luxury of her cabins. The Imperator is built with an inner-skin, with both longitudinal and transverse bulkheads, and other original features. Taking advantage of her great dimensions, the ship's public cabins and staterooms have been made so large as to avoid any suggestion of crowding. The Imperator is the latest addition to the fleet of the Hamburg-American Line.

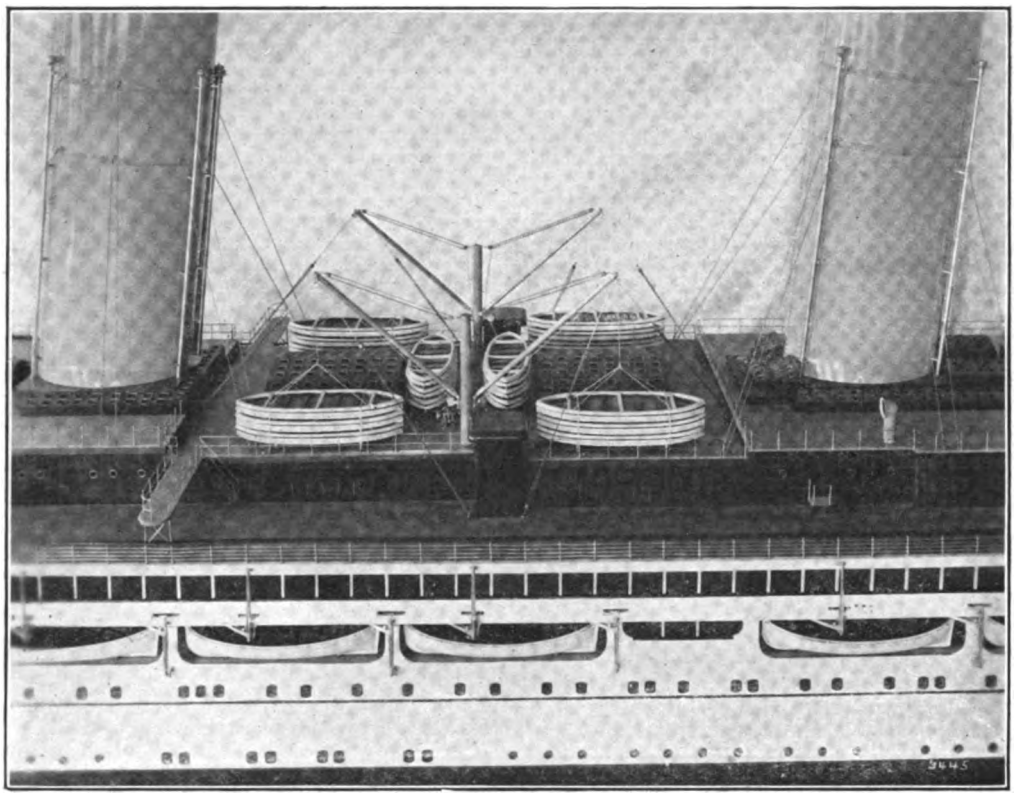
The Imperator measures 919 feet in length or almost one-fifth of a mile, 98 feet in width or that of a great boulevard, and has a tonnage of 50,000. Her powerful quadruple turbine engines drive her at an average speed of 22½ knots an hour, crossing the Atlantic in six days. She is manned by a crew of 1,180, selected for their long service on other ships of the Line. The rigid discipline for which this service is famous obtains in every department. Despite her great size, the Imperator carries only a few more passengers than ships of half her tonnage, assuring complete comfort of all on board.

No hotel on either side of the Atlantic offers its guests so great a choice of dining rooms, ball rooms, winter gardens and palm rooms, grill rooms, smoking rooms, gymnasiums, roof gar-



STEAMSHIP IMPERATOR OF THE HAMBURG-AMERICAN LINE. THE LARGEST STEAMSHIP AFLOAT.

Digitized by Google



MODERN METHOD OF LAUNCHING LIFEBOATS.

dens, public baths and luxurious lounges. The leading decorators of Europe have been entrusted with the decorations of the Imperator's cabins, and each is a masterpiece in its individual style. The great size of the Imperator has made it possible to give her some of the most spacious rooms ever enjoyed on shipboard. The main lounge, which may be converted into a ball room, is hung with Goblin tapestries and equipped with a practical stage for theatrical performances. An unusual amount of space has been set aside for an elaborate winter garden with a wealth of tropical vegetation. There is a running track, an elaborate Roman bath and swimming pool, and a variety of Russian, mineral and electric baths with skilled attendants, a florist, candy and book shop, a public stenographer, a photographic dark room, electric elevators, and every conceivable appointment to assure luxury and variety throughout the Atlantic crossing.

The Imperator has been constructed with sixteen steel bulkheads, forming in all thirty-six water-tight compartments. These are still further subdivided by the steel decks, giving the ship a cellular construction throughout. The bulkheads have been carried to the level of the second deck, high above the water line. A single bulkhead weighs 1,200 hundredweight. These steel compartments have been completely flooded with water to test their efficiency under extreme conditions. The bulkheads are fitted with Dorrscher doors and closing appliances operated hydraulically from the commander's bridge, while a second appliance operated from the upper deck is held in reserve.

The Imperator carries eighty-three large life boats of the most approved type, accommodating everyone on board. Two of these are high-powered motor boats, capable of towing the others. The motor boats are equipped with wireless telegraph working over 200 miles. Many of these boats are carried on the upper deck between the funnels, and may be lowered by special cranes to either side of the boat. The apparatus employed for handling all these boats is of the newest type, making it possible to lower a boat from an upper deck in a few seconds. The safety equipment also includes life belts for everybody and illuminated life buoys. The efficiency of all apparatus is assured by frequent drills and rigid discipline.

In every detail of its construction, the Imperator more than conforms to the laws governing shipbuilding, both in America and Europe. It has been built according to the regulations laid down by the Germanian Lloyd for the first class, four screw, passenger and freight steamers, and has been equipped with every appliance required for emigrant ships by the German laws, the Marine Association, the Sailors' regulations, and the English and American emigrant laws. In the construction of the Imperator 1,800 workmen were engaged for three years of for a total of more than 1,000,000 working days. The contract was given to the Vulcan Works at Hamburg, June 18, 1910, and the ship was christened by His Majesty Kaiser William II and launched May 23, 1912. Some idea of the magnitude of the work may be gained from the fact that her sides are built upon 327 steel ribs, on either side, each measuring 26 metres in length and weighing 30 hundredweight. The weight of the steel plates,

Digitized by Google

angles, profiles, sheet iron, etc., totals 520,000 hundredweight. More than 2,000,000 steel rivets have been used in her construction, each weighing eleven pounds. More than 60,000 cubic metres of different kinds of wood have been used.

The Imperator has a commander, an executive captain, and three watch captains, one in special charge of navigation and another of the safety conditions, assisted by seven officers. The engineering department is directed by one chief engineer, three first engineers as watch engineers, and a staff of 25 engineers and electricians.

The wireless telegraph equipment of the Imperator is sufficiently powerful to work over a range of 1,500 sea miles. The ship has two reserve antennæ and two receiving instruments for long and short waves, designed for news service and rescue work. The station is directed by three expert operators, one of whom will always be at the key. The Imperator will be within direct communication with land through the Atlantic crossing. The electrical equipment of the Imperator is unusually complete. Current is developed by five Turbo dynamos and a motor dynamo driven by a benzine motor placed high above the water line on the boat deck for emergency lighting. The ship is lighted by more than 10,000 electric lamps, distributed throughout the ship. Electrical power is employed for operating the four passenger and five provision elevators, the winches, pivotal cranes, call bells, heating, etc.

The Imperator is propelled by mammoth quadruple turbine engines developing 62,000 horsepower. She has four winged screws of turbadium bronze, measuring more than five metres in diameter, which turn at a normal speed of 185 revolutions per minute. The machinery for reversing the engines is especially efficient, enabling her commander to direct her movements more quickly than that of ships of far less tonnage. The backward moving power of all the reverse turbines is about 35,000 horsepower. The ship has four furnace rooms which are divided into watertight compartments by transverse and longitudinal bulkheads.

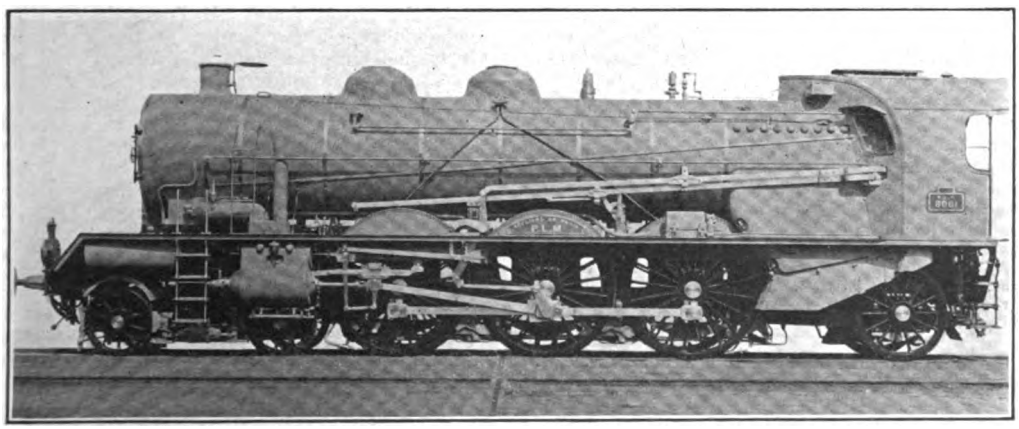
The Imperator carries five great anchors which are secured by steel chains having a total length of three quarters of a mile. The main anchor weighs 26,455 pounds, her two bow anchors 17,636 pounds, a fourth 11,463 pounds and her warp anchor 4,960 pounds. The anchors and chains together have a total weight of 485,082 pounds which alone makes an important item of cargo.

The Imperator carries a number of compasses distributed on the commander's bridge, in the filter space on the third deck and in the rudder house at the stern. The equipment includes an Anschutz revolving compass, consisting of a "mother compass," two motor generators with starters, revolution recorders, and division tables. There are four "daughter compasses" which serve as azimuth and steering compasses besides four magnetic compasses provided as an emergency outfit, including one azimuth compass and three steerage compasses.

To assure a pleasant crossing in all extremes of weather, the Imperator has been equipped with the Schlinger tanks or wave motion absorbers. This stabilizing device when tested on smaller steamers has reduced the rolling motion from thirteen degrees from the vertical to less than three degrees. The great size of the Imperator renders her naturally very steady in the highest seas, and assisted by the anti-rolling tank, she will be doubtless one of the steadiest ships in the world.

A Show Locomotive at Ghent, Belgium

AMONGST the locomotives now being shown at the International and Universal Exhibition at Ghent, Belgium, is one of a type built in the Paris works of the Paris-Lyons-Mediterranean Company for hauling heavy express trains and was designed by this company in 1909, originally as a compound engine using saturated steam. The first engine built was compared in ordinary working service with a non-compound engine of the same power, having four equal cylinders, and using superheated steam. Experience having shown the superiority of the single-expansion engines using superheated steam over the compound type using saturated steam, the



PARIS-LYONS-MEDITERRANEAN EXPRESS LOCOMOTIVE, NOW ON EXHIBITION AT GHENT (BELGIUM) UNIVERSAL EXHIBITION.

Digitized by Google

company built a number of the former. A third type of equal power, but compound and using superheated steam, having shown itself much superior to both the above named types, it was decided to transform the locomotives of the compound type using saturated steam into a compound type using superheated steam, keeping as closely as possible to the design of the third type above referred to. The engine so transformed is the one exhibited.

The boiler is built up throughout of mild-steel plates with the exception of the firebox, which is of copper. The firebox shell, which overhangs the frame is in three plates, the crown and the two sides, connected together by double riveting. Hollow steel stays connect the crown of the outside shell to the firebox crown, and a row of transverse stays, drilled out for a lengtth of 194 mm. (7.6 inches) at each end, run across from side to side to support the flat part of the shell-plating not supported by the firebox stay bolts. The front and back firebox plates are inclined. The copper firebox is connected to the shell by manganese bronze stays, except for the portion of the sides located beneath the firebrick arch, where the stays are of copper. The firebox tube plate is connected to the boiler shell by ten steel palm stays.

The boiler barrel is built up of three rings; the longitudinal seams are butt-joined with double straps, and the transverse seams are double-riveted lap-joints. The firebox door is hinged horizontally and opens upwards and inwards; it consists of three leaves; the two end leaves are opened by separate levers; the central leaf butts on both the other two and is opened together with either one of them. The superheater is of the Schmidt type.

The frames are of steel, 28mm. (1.1 inches) thick; they are connected together by a front buffer beam consisting of a rolled steel girder, by a rear beam built up of plates and angles, by six intermediate transverse stays of cast steel, and by the inside cylinders. The front bogie truck is of the usual type. The Bissel bogie at the trailing end is built up of two sets of horn-blocks in small frames, connected together at the top by a strong transverse beam of cast steel, and at the front and back ends by two smaller beams. The small plate frames extend in front of the front beam towards the center line of the main frame, and join a V piece to which they are riveted, and which carries the eye for the radius-pin; this latter is 1.9 m. (6 feet 3 inches) in front of the bogie axle. The locomotive underframe rests by a spherical center bearing upon the cross bearer of the Bissel chassis. The center pin socket rests on a seating supported on crossed inclined surfaces, and is carried in guides curved to a radius struck from the radius pin. By this means an angular displacement of the Bissel bogie slightly raises the rear part of the engine. The Bissel bogie has a lateral play of 60mm. (2.6 inches.) on each side. The load is transmitted to the Bissel truck axle by two helical springs on either side, each pair of springs being connected by an equalizer beam suspended from the lower part of the corresponding axle box.

The driving wheels are 2m. (6 feet 6 11-16 inches) in diameter at the tread. The axles are of steel, with inside journals, and are hollow for the whole length. The front drving axle coupled to the low pressure inside cylinders is cranked. The wheel centers are steel castings. The axle boxes are also steel castings, the steel having a breaking strain of 60kg. per square mm. (38 tons of 2,240 pounds eaeh, per square inch), with a 12 per cent elongation. The bearings are of brass, lined with white metal. The axle boxes are provided underneath with spring lubricating oil pads, no other provision being made for the lubrication of the axle journals. The horn blocks are riveted to the frames; they are steel castings and are fitted with cast iron faces. Wedges worked by screws allow of taking up for the wear of the axle boxes in the guides. The frame is suspended from the axle boxes on laminated springs connected by equalizing bars and adjustable spring hangers.

The inside low pressure cylinders drive the leading crank axle; the outside high pressure cylinders drive the second axle. The cranks are 90 degrees apart, and the axles are set so that cranks on the same side of the centers are 180 degrees apart. The pistons are steel castings; the piston rods are of forged steel. The crossheads are steel castings, having castiron slippers lined with white metal. The crosshead guides are of hard, forged steel, having a breaking strength of 55kg. per square mm. (35 tons per square inch) with an elongation of 20 per cent. The connecting and coupling rods are of steel, with brass bearings lined with white metal.

The valve gear is of the Walschaert type. The slide valves are cylindrical, with inside admission; an air inlet valve is fitted on the main steam pipe and on the pipe which forms the intermediate receiver. The reversing mechanism is a screw gear provided with the ordinary type of hand wheel the nut on the screw working the reversing rod of the high-pressure cylinders; the reversing rod of the low pressure cylinders is worked when the nut above referred to has moved a certain distance on either side of its normal position. There are two reversing rods for the link motion, that for the high pressure cylinders connected to the screwed nut, and that for the low pressure cylinders connected to pins on a frame moved by the high pressure reversing rod nut. A dash pot is also provided consisting of a cylinder containing a liquid in which works a piston connected by means of levers to the reversing bar of the low pressure cylinder slide valves.

Steam is taken from the boiler through a regulator provided with a balanced valve, and located inside the steam dome. It flows thence into a compartment of the header in the smoke box which distributes it into the twenty-eight elements of the Schmidt superheater, then flowing into the second compartment of the header or collector, whence it flows to the high pressure cylinders through two pipes connected to the two ends of this latter compartment. The slide valves and the air pump are lubricated by a sight feed lubricator fitted to the firebox back plate and consisting of an oil receiver and a distributor. Each cylinder is also provided with a ball lubricator.

A counter pressure cock fitted to the boiler, and having a handle within easy reach of the driver, takes water and steam through a bent pipe, the lower part of which is provided with a hole; the pipe enters the firebox and bends upwards above the water level. A second pipe, starting from the cock supplies the mixture of water and steam to the exhaust of the low pressure cylinders.

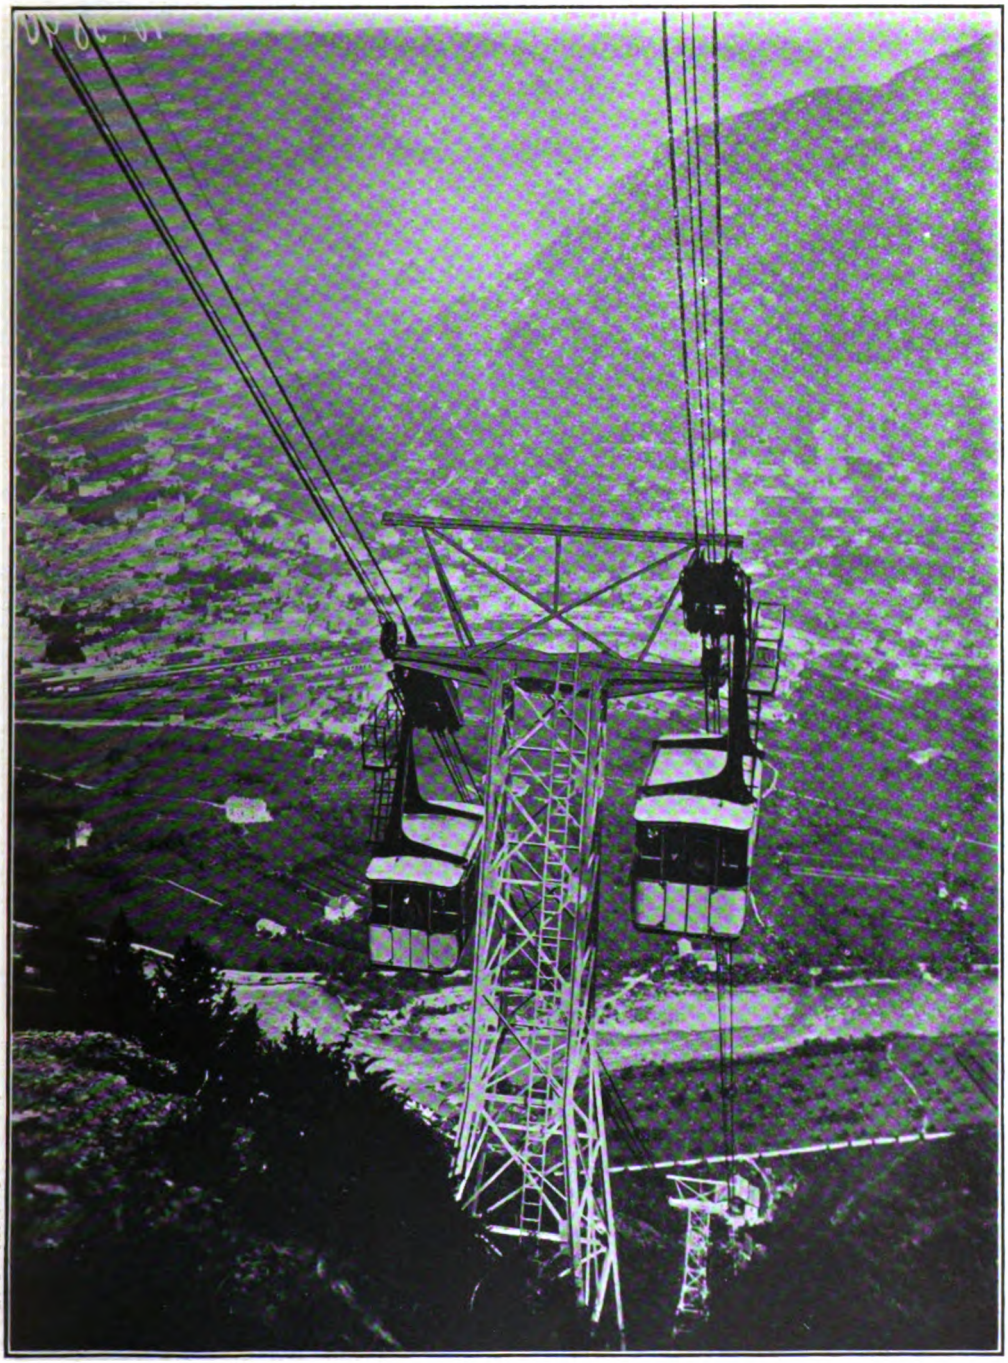
The Kohlerer Aerial Ropeway of Switzerland

THE Kohlerer (Switzerland) aerial line has a total length of 5,500 feet carried by 12 structural steel supports, the highest of which is about 90 feet above the ground, and a distance of about 1,433 feet from the lower station.

The passenger cars are each capable of holding 15 passengers and the driver and two cars travel simultaneously each way at one time. The speed is about 10 feet per second and such that in thirteen minutes a difference of level of 2,800 feet is traveled each car being pulled by two traction



CARS PASSING ON THE KOHLERER AERIAL RAILWAY.

Digitized by Google

cables which are operated from a power station placed close to the line. The object of duplicating the cables is to secure safety in case of the breakdown of one of the cables, and the same means is adopted in connection with the suspension cables.

The cars are supported from a traveling mechanism carried by eight pulleys. Each of the steel cables on which those pulleys travel are about 1.76 inches in diameter. The cars can swing like a pendulum while a brake retards any due oscillation. All fear of derailment due to oscillation sideways is avoided by the fact that the carrying cables themselves swing with the car. The drive is by electric motors, and in order to secure immunity from breakdown of the transmission system even if the power plant fails to operate a storage battery is installed which op-

THE HIGHEST SUPPORT ON THE KOHLERER AERIAL RAILWAY.

Digitized by Google

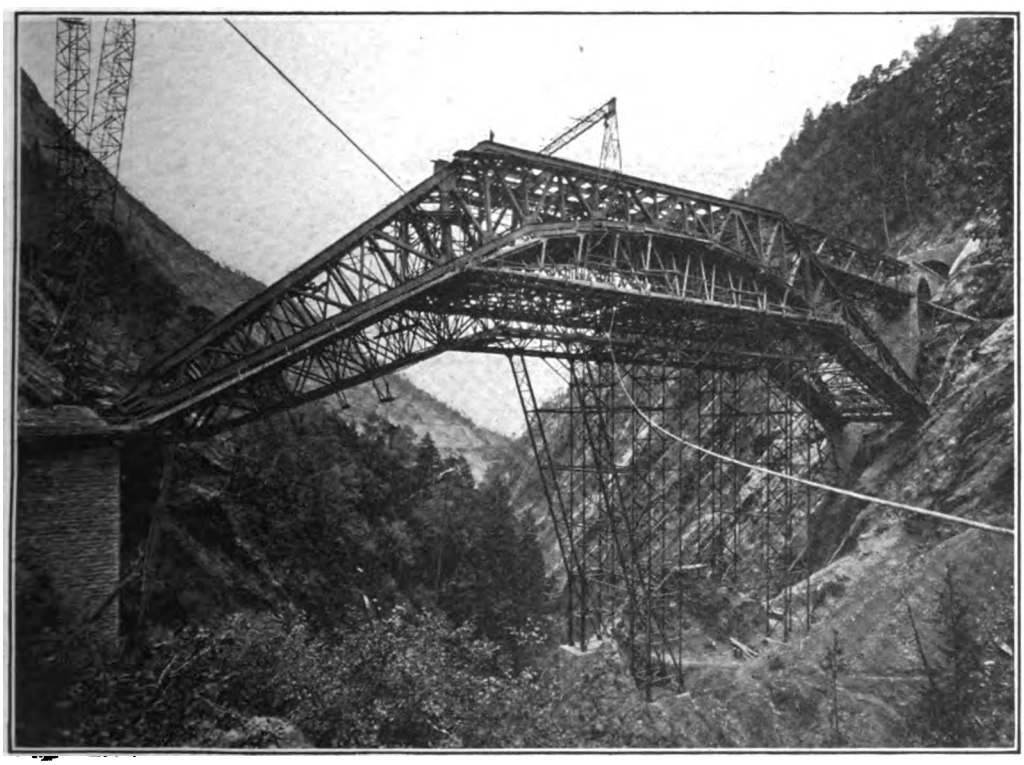
erates in parallel with the generator. To provide communication, a system of telephones and electric signals is installed throughout the track, and the driver from any part of the line can communicate with either the upper or lower terminal station.

The cars cannot be started before the necessary signals have been given between the two stations and confirmed so that there is no danger of mistake. In addition to this, safety is most efficiently studied in connection with every detail of the equipment. The traveling mechanism of the car contains two braking arrangements which operate automatically if there is an excess of speed. The same device operates if the carrying cable breaks or if a break should occur on either one or both of the hauling cables. Besides being automatic, the operator can put the brakes into service by hand, the operation being simple and quick, and when this catching device is put into action steel jaws grip the carrying cables at eight different places and the friction is sufficient to hold the car firmly in position even on an incline. Simultaneously, by the movement of the same mechanism, the supply of electricity to the driving motor is stopped and the brake is instantly applied. To provide further security and insure the safety of the passengers in the event of a breakdown, there is a space car kept at each station in readiness to go to the point where the ordinary car is left suspended, transferring the passengers and bringing them back to the nearest available station.

The regular passenger car is also fitted with a special device in the floor by means of which it is possible to lower the passengers to the ground from the car direct. This hoist is fitted with a brake to prevent undue speed of the descent and should the driving gear of the whole line break down, thus stranding the cars in the middle of the route, an auxiliary winder is available for bringing the cars back to their terminal position. The towers which support the cables vary in height from about 25 feet to 90 feet.

Bridge and Viaduct Construction on the Bernese Alps Electric Railway

ON the Bernese Alps electric railway from Frutigen to Brig, a remarkable bridge known as the Bietschtalbracke has recently been completed. This bridge, as well as several important viaducts on this line are of special interest, the former particularly on account of its peculiar construction as indicated in the accompanying illustration. In the frame work used in constructing this bridge, 330 tons of iron and steel were used while the bridge itself weighs 900 tons, and was completed about February 1st, 1913, or a year and a half after operations were begun. In its erection two steam derricks were used, each having a radius of action of about



A Remarkable Bridge on the New Bernese Alps Electric Railway.

Electric Overhead and Track Equipment of the New Bernese Alps Electric Railway.

Digitized by Google

83 1-3 feet, and of the 125,000 rivets used about 50,000 rivets were driven into place by pneumatic hammers.

Thirty years ago the Bernese Alps electric railway pierced the granite rampart of the Alps for the first time, in order to build a railroad through the Gotthard, by which to easily reach Italy. Since that time numerous railways and tunnels havs been constructed which show convincingly the skill of the engineers and the hardiness of the workmen. The Gotthard tunnel which is about 9½ miles long, has been out-distanced by the Simplon tunnel, and the grandest projects for bridges viaducts have been realized in the new railway Berne-Lotschberg Simplon, which will be opened this spring.

The Bernese-Alps Railway Berne-Loetschberg-Simplon, combines the finest technical construction with wonderful scenery in a superlative degree. The new railway, which leads through the Bernese Alps from Frutigen to Brigue in the valley of the Rhone, connects first the surroundings of the lake of Thoune, Berne and Interlaken. In other words, it connects the Bernese Oberland, with the upper part of the canton of Valais, the upper valley of the Rhone especially, also the great mountain and tourist centres of Zermatt and Saas-Fee. It passes as well through the Simplon tunnel to the lovely "Lago Maggiore" to the Borromee Islands and to Milan, Turin and Genoa, the industrial and commercial centers of upper Italy. It offers for travelers from England, Belgium, France and Germany to Italy a route which is in no way inferior to the Gotthard line and has the advantage of enabling one to have a very comfortable and completely smokeless journey, since it is operated by electricity and so is also the Simplon tunnel, which was opened in 1906.

After having passed the Kander on a high viaduct, the new line Frutigen Brigue rises slowly on the mountain slope describing a great double curve partly in a spiral tunnel near the "Blue Lake."

From the Kandersteg the railway runs above the serpentines of the highway and passes over the waterfalls of the Kander along the valley. During the whole journey travelers become fascinated by the ice clad mountain giants Altels, Dalmhorn, Rinderhorn and Doldenhorner, the summit of the Bluemlisalp and the rocky giants Bierre and Risistock, which all surrounds the lovely village of Kandersteg.

The main tunnel (about 48,683 feet long) runs through the Risitock and underneath the Gasterntal and the Loetschen pass, reaching the southern end at Goppenstein in the Loetschental (Valais). Beyond Goppenstein, the Loetschental with the gigantic Bietschhorn, opens in a large wonderful Alpine valley of original character, which till now like few valleys, has hardly come in contact with the tourist traffic. Little below Goppenstein near Hothen, the railway enters the valley of the Rhone about 1,333 feet above the bottom of the valley.

It will be seen that the traveler has here an incomparable and wonderful view over the valley of the Rhone in the depth below him, upon the splendid numerous brown villages and cottages with their white churches. The line slopes gradually down to Brigue, passing over numerous large viaducts and deep ravines of the northern tributaries of the Rhone, piercing through the projecting rocks by twenty-one tunnels.

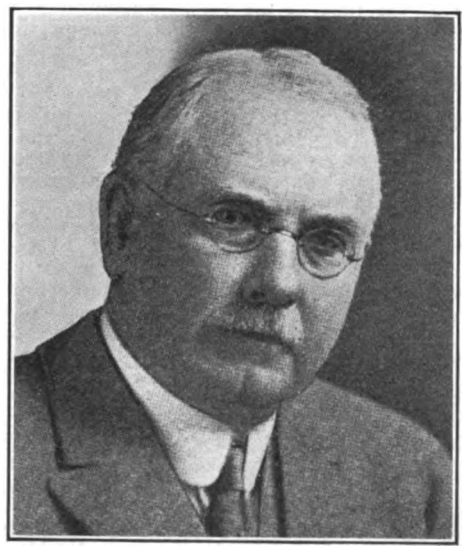
Personal

W. J. Jackson.

WILLIAM J. JACKSON, who for the past three years has been vice-president and general manager of the Chicago and Eastern Illinois, and who recently was made one of the receivers for the road, has now become president, having been elected at the annual meeting of that road on June 5. He succeeds B. L. Winchell who, as recorded elsewhere, has been appointed one of the receivers of the St. Louis and San Francisco.

Mr. Jackson's continuous connection with the Chicago and Eastern Illinois dates from 1891 when he entered the service of that road as assistant local freight agent at Chicago. He was born at Toronto, Ont., in 1859, and after a grammar and normal school education, entered railway service in 1877, as machinist's helper in the Grand Trunk shops at Toronto. After serving in this position for a few months, he was made freight clerk at Toronto, which position he held for three years and for three years more was chief claim clerk of the Chicago and Grand Trunk at Chicago. From 1885 to 1890 he was general freight foreman of this road, and from 1890 to 1891, assistant agent. As above noted, he entered the service of the Chicago and Eastern Illinois in 1891 as assistant local freight agent. In 1893 he became local agent, in 1899 assistant general superintendent, in 1903 general superintendent, in 1906 general manager and in 1909, at the time of the separation of the Rock Island and Frisco systems, he was made vice-president and general manager.

Mr. Jackson has engaged in important railway work outside of his immediate position, having



W. J. JACKSON.

Digitized by Google

been chairman of the special committee on Relation of Railway Operation to Legislation, since the death of F. O. Melcher in January of last year. He has also had considerable experience in labor negotiations, and in 1910 was appointed by Governor Deenen as a member of the Employers' Liability Commission for that State.

Benjamin Campbell.

BENJAMIN CAMPBELL has been appointed vice-president of the Boston and Maine Railway, in charge of the traffic department, with headquarters at Boston, Mass. Mr. Campbell was connected with the Union Pacific System from 1884 to 1905, and in the latter year became fourth vice-president of the Great Northern Railway Company. He entered the service of the New Haven road early in 1907,

BENJAMIN CAMPBELL.

and at the time of his recent appointment was located at New Haven, Conn., as vice-president in charge of the traffic department.

P. H. Morrissey.

P. H. MORRISSEY, until recently president of the American Railroad Employes and Investors Association, has been appointed assistant to the vice-president in charge of operation of the Chicago, Burlington and Quincy, with headquarters at Chicago. Mr. Morrissey was born September 11, 1862, at Bloomington, Ill. He began railway work in 1879 as call boy in the locomotive department of the Chicago and Alton at Bloomington, and the following year entered the train service as a passenger brakeman. Subsequently he was freight brakeman and freight conductor. He left active railway service in 1890 to assume the position of vice-grand master of the Brotherhood of Railroad Trainmen, which organization he had joined in February, 1885. He continued in that capacity until August 1, 1895, when he became general master, which office he retained until January 1, 1909, at which time he was elected president of the American Employes and Investors Association. Within recent years Mr. Morrissey has served as arbitrator in a large number of wage controversies be-

P. H. MORRISSEY.

tween railways and employes. In 1910, with Interstate Commerce Commissioner E. E. Clark, he arbitrated the demands of the conductors and trainmen on the New York Central and Hudson River, making an award which was later adopted by other lines. He also represented the enginemen in the arbitration proceedings begun in Eastern territory in May, 1912, and arbitrated the demands of the enginemen, firemen, conductors and trainmen on the Coal and Coke Railway, under the Erdman act in 1911.

J. T. Morrison.

J. T. MORRISON, who was recently elected vice-president of the Pullman Railroad Company, with offices at Chicago, entered railway service in 1889, as messenger boy for the Burlington. In 1892, he went with the Chi-

J. T. MORRISON.

cago, Milwaukee and St. Paul as contracting and traveling freight agent at St. Louis, and in 1895

Digitized by Google

became chief clerk to E. S. Keeley, now vice-president of that road. He remained in this position until 1901 and then left the railway service to become traffic manager for the Racine Wagon and Carriage Company, with whom he stayed until 1908 when he became secretary and traffic manager of the National Implement and Vehicle Manufacturers' Association. On April 15, 1912, he again entered railway service as traffic manager of the Pullman Railroad, which position he held until his recent election to the vice-presidency of that company.

George T. Bell.

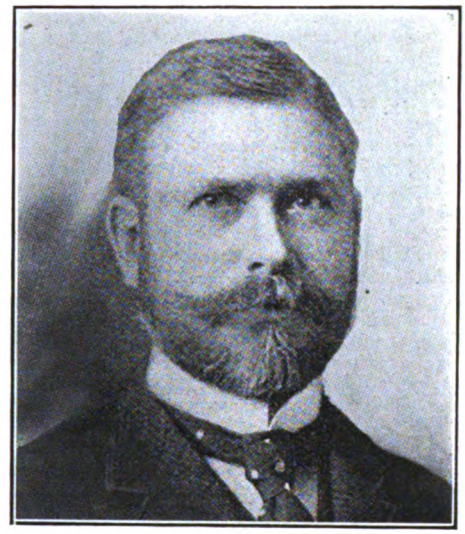
GEORGE T. BELL, who was recently appointed passenger traffic manager of the Grand Trunk Railway, was born at Montreal, Quebec, on September 7, 1861. His first railway position was with the Great Western

GEORGE T. BELL.

Railway in 1878 and in 1880 he joined the passenger department as stenographer to the general passenger agent at Hamilton, Ont. He was afterwards at Toronto as chief clerk to the assistant general passenger agent; January 1, 1885, to April 25, 1892, chief clerk to general passenger agent; April 25, 1892, to April 1, 1896, assistant general passenger agent same road; April 1, 1896, to August 1, 1899, assistant general passenger and ticket agent; August 1, 1899, to May 1, 1900, first assistant general passenger and ticket agent at Chicago; May 1, 1900, to May 1, 1909, general passenger and ticket agent at Montreal; August 15, 1908, to May 1, 1909, also general passenger and ticket agent of the Grand Trunk Pacific Railway; May 1, 1909, until this recent appointment, assistant passenger traffic manager, Grand Trunk Railway system, and Grand Trunk Pacific Railway.

W. C. Stith.

WILMER C. STITH, recently appointed traffic manager of the Terminal Railroad Association of St. Louis, was born in that city in 1858, and began railway service in 1877 in the general freight office of the St. Louis, Iron Mountain and Southern. In 1886, he was



W. C. STITH.

made assistant general freight agent of the Missouri Pacific, and from 1890 to 1892, was general freight agent of the Kansas City, Fort Scott and Memphis, with headquarters at Kansas City. He returned to the Missouri Pacific system in the latter year as general freight agent, and in 1899 was promoted to freight traffic manager. In 1908, he became traffic manager of the Waters Pierce Oil Company. For the last two years he has been engaged in special traffic work, the last few months of which having been spent with the Terminal Railroad Association.

C. E. Perkins.

C. E. PERKINS has been appointed assistant general traffic manager of the Missouri Pacific with headquarters at St. Louis. He was born in 1871 and began railway work in 1891 as office boy in the freight office of the Kansas City, Fort Scott and Memphis at Kansas City.

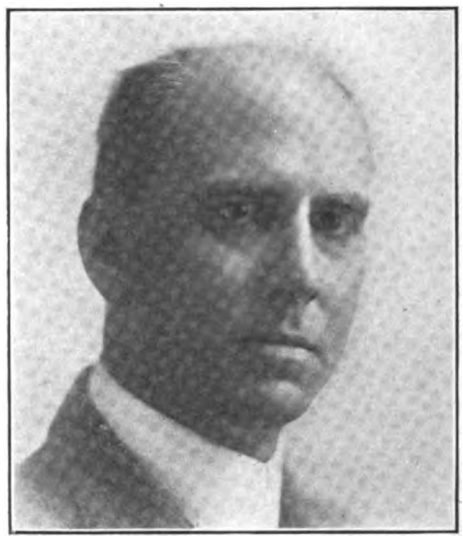
C. E. PERKINS.

Digitized by Google

In 1896 he went to the St. Louis and San Francisco as chief clerk to the general agent at Kansas City and in 1897 he was made chief tariff clerk for the Kansas City, Pittsburg and Gulf, now known as the Kansas City Southern. He was afterwards made chief clerk in the freight department, and later was appointed assistant general freight agent. For a time he was stationed at Texarkana, Ark., as assistant general freight agent and also as general freight agent of the Texas line of that road. In 1906 he was again transferred to Kansas City as assistant general freight agent, and in March, 1909, he went to the St. Louis, Iron Mountain and Southern as assistant general freight agent at St. Louis. He was made general freight agent of the Iron Mountain on January 1, 1910.

W. G. Barnwell.

WALTER G. BARNWELL, recently appointed assistant freight traffic manager of the Atchison Coast Lines, with headquarters at San Francisco, was born in 1865, at Danville, Quebec. He began railway work in 1881 as agent in the office of the auditor of freight accounts of the Canadian Atlantic, and from 1884 to 1891, was agent in the superintendent's office of the Fergus Falls division of the Great Northern. From then until 1898, he was with the Southern California, successively as cashier at Redlands, Cal., agent at Santa Ana, Cal., contracting agent and commercial agent. On the latter date he was promoted to general agent of the freight department at Los Angeles, Cal., and in 1900 he was made assistant general freight agent of that road, the Santa Fe Pacific and the San Francisco and San Joaquin Valley, which roads now comprise the Coast Lines of the Atchison, Topeka and Santa Fe. In April, 1905, Mr. Barnwell became general freight agent of the Coast Lines.



Arthur T. Stewart.

ARTHUR T. STEWART, who was recently appointed general freight agent of the Missouri Pacific with office at Kansas City, was born at Humboldt, Kans., in 1872. He entered railway service July 1, 1890, as stenographer for the Rock Island and Pacific at Topeka, Kans., and in 1891, became secretary to the general manager of the St. Louis Southwestern, and in 1892 secretary to the freight traffic manager of the Missouri Pacific. Ten years later he was made assistant general freight agent, and in 1908 became assistant to the vice-president in charge of traffic. In January of the present year, Mr. Stewart was appointed assistant to the general traffic manager with headquarters at St. Louis, which position he held until his recent appointment.

L. D. Knowles.

L. D. Knowles.

L. D. KNOWLES, who was recently appointed assistant general freight agent of the Missouri Pacific Railway, with headquarters at St. Louis, entered railway service in 1883, as a boy as clerk in the Michigan Central local freight office, at Grand Rapids. He was promoted from various positions, becoming assistant cashier in 1886. From the latter part of that year until 1890 he was chief clerk to the general agent of the Grand Rapids and Indiana at Grand Rapids, Michigan, and in 1890 became contracting agent and traveling freight agent of the Mississippi Valley Route. From 1891 to 1895, he was traveling freight agent of the Cotton Belt Route, and from 1895 to 1903, contracting agent for the Missouri Pacific Railway. From the latter year until 1908, he was general agent of the Gould Lines, with headquarters at Milwaukee, and from 1908 to September, 1912, general agent of the Missouri Pacific at Denver. He was transferred on the latter date to Pittsburgh as the general agent of the same company, and on May 20th, 1913, was made assistant general freight agent at Omaha, Nebraska, as above noted.

Henry P. Anewalt.

HENRY P. ANEWALT has been appointed general freight agent of the Santa Fe Coast Lines. He was born in Allentown, Pa., in 1868, and began railway work in 1885 as clerk and engineer of the Santa Fe's local freight office at Kansas City. He was later successively chief clerk in the commercial office and contracting agent at that place, and subsequently became general freight and passenger agent of the Santa Fe, Prescott and Phoenix at Prescott, Ariz., until April, 1905. He was then appointed assistant general freight agent of the Coast Lines of the Atchison, Topeka and Santa Fe, with office at San Francisco, Cal. He remained in this position until June 1, 1913.

H. P. ANEWALT.

Cecil A. Preston.

CECIL A. PRESTON, who was recently appointed valuation engineer for the Pennsylvania Railroad, was born at Philadelphia, Pa., September 16, 1852, of English parents. He was educated at the public schools and the Polytechnic College of Philadelphia, graduating from the latter institution in 1872.

Mr. Preston entered the service of the Pennsylvania Railroad in May, 1879, and was employed on surveys for the Catonsville Railroad and for changing alignment and grades for the West Pennsylvania Railroad. In September, 1880, he was transferred to Baltimore, as assistant supervisor of the Baltimore section of the Northern Central Railway. In November, 1880, he resigned and accepted the position of principal assistant engineer of the Mexican National Construction Company, being assigned to the Pacific Coast Division.

After active service of eighteen months in Mexico upon preliminary surveys, location and construction, Mr. Preston returned to the United States in April, 1882, and entered the service of the Northern Central Railway as assistant supervisor at York. He was promoted to supervisor on August 1, 1882, and transferred to Baltimore in 1883. On January 1, 1890, he was appointed assistant engineer of the Baltimore division, and on March 1, 1893, promoted to principal assistant engineer of the Philadelphia and Erie Railroad division and the Northern Central Railway. On July 1, 1900, he was promoted to superintendent of the Elmira and Canandaigua division. On April 1, 1902, he was made superintendent of the Eastern and Susquehanna division of the same road, and on June 1, 1903, was promoted to superintendent of the Middle division of the Pennsylvania Railroad division, at Altoona.

L. J. Putnam.

L. J. PUTNAM has been appointed principal assistant engineer of the Chicago and Northwestern with office at Chicago. He was born at Manchester, Ia., in 1878 and graduated from Cornell College, Ia., as civil engineer

L. J. PUTNAM.

and began railway work in 1898 with the Illinois Central. In 1899 he went with the Chicago and Northwestern as instrument man and from 1901 to 1906, was assistant engineer on construction, location and mainteannce of this road. Later he became acting division engineer of the Ashland division, and from 1910 to 1912, he was with the new line of the Chicago and Northwestern across Wisconsin, as resident engineer on construction, and later as acting resident engineer. In April, 1912, he was promoted to division engineer at Boone.

E. G. Chenoweth.

E. G. CHENOWETH, who was recently appointed mechanical engineer of the Chicago, Rock Island and Pacific Railway, was born at Union City, Indiana, in 1873. He graduated from Purdue University in mechanical engineering in 1898 and entered railway work as a special apprentice in the locomotive shops of the Erie Railroad. In 1901 he went to the Pennsylvania Railroad as a draftsman at Altoona, Pa. In 1903 he was with the Pere Marquette Railroad in a similar capacity, and later with the Lake Shore and Michigan Southern Railroad and Philadelphia and Reading Railway. He returned to the Erie Railroad at Meadville, Pa., as draftsman, was appointed mechanical engineer and served in that position six years until he came to the Rock Island in July, 1912, as assistant superintendent of the car department. Mr. Chenoweth was promoted to mechanical engineer in charge of car designing, as already noted, June 1, 1913.

E. G. CHENOWETH.

N. E. Brooks.

N. E. BROOKS, recently appointed maintenance of way engineer for the Western lines of the Canadian Pacific Railway, was born at Sherbrooke, Que., in 1866. He began work with the Canadian Pacific Railway as chainman in 1887, on the Ontario and Quebec branch. In 1888 he served as rodman and resident engineer of construction on the Atlantic and Northwest branch of that road. From 1889 to 1893 he was transitman and resident engineer in connection with surveys and construction of the Calgary and Edmonton and MacLeod and Crows Nest branches of the Canadian Pacific, and from 1893 to 1903, representative of the bondholders in connection with the Calgary and Edmonton lines, with headquarters at Calgary, Alta. From 1903 to 1910 he was division engineer of the western division and since 1910, until his recent appointment, has been division engineer of the Alberta division, with headquarters at Calgary.

N. E. BROOKS.

Financial

The Currency Question.

INTEREST in financial circles has shifted from the tariff to the currency question. The administration's bill for reform of the banking system, introduced by Representative Carter Glass (Virginia) of the House Banking and Currency Committee, provides for the creation of twelve so-called federal reserve banks, one in each of twelve geographical districts. The ownership of these banks is to be in the hands of the State and National Bank of each district; the National Banks are compelled to be members, and the State Banks and Trust Companies are permitted to be members. The capitalization of the federal reserve banks is to be twenty per cent of the capital of the stock holding banks, one-half paid in and one-half subject to call. These federal reserve banks are to confine themselves to the re-discounting of paper for their stockholders, buying and selling government securities, coin and bullion, foreign exchange and bills of a good maturity, and government fiscal operations. These federal reserve banks are to be authorized to issue $500,000,000 of federal reserve treasury notes, secured upon short time paper and other liquid collateral, and in addition by a reserve of 33 1-3 per cent of gold. These notes will, on their face, be obligations of the United States, but their security will be provided by the issuing bank. Existing notes of national banks are left undisturbed but provision is made for their gradual retirement, by prohibiting any further increase. The control of the system is tested in a federal reserve board of seven members including the Secretary of the Treasury, Secretary of Agriculture, and the Comptroller of the Currency, together with four other members chosen by the President. The most important duty of this reserve board will be to fix the rate of discount for the federal reserve bank. The federal reserve bank will be the depositary of the current funds of the treasury, and all government creditors will be paid by checks on these deposits. In addition to government deposits, all legal reserves from existing national banks in reserve and central reserve cities, over a period of 38 months, will be transferred to the national reserve banks. This feature of the plan is intended to end the concentration of reserves in central reserve city banks for use in stock market operations.

It is too early to discover how this measure will be received by the country. It bears, in many of its features, a striking resemblance to the Aldrich plan. It is certain to result, if put into effect, in removing a large amount of money from New York with the result that the New York banks will have to supply these funds from other sources, since they can no longer draw upon the legal reserve of the national banks. The re-discounting feature is nothing new. Banks already have the right to re-discount, but few of them take advantage of the privilege because of the injurious effect upon their credit. Some exceptions have been taken to the scheme of control provided by the bill, on the ground that the bank might be used for political purposes. We do not believe that there would be the slightest danger of this. It is inconceivable that any administration should sink so low as to use its power over the currency and credit of the country to further political ends. To believe this is to admit the complete absence of belief in the ability of republican institutions to produce honest and responsible officials.

Liquidation of Securities.

THE past month has witnessed a severe liquidation of securities with resulting heavy shrinkage in value. The last week in May saw the St. Louis and San Francisco properties placed in the hands of receivers. This event was preceded by heavy declines in the prices of stocks and bonds of this company which exerted a most depressing effect, extending to the foreign market for American securities. With the following week urgent liquidation broke out which brought security values down to the lowest values of recent years. Transactions were on a very large scale and declines were numerous.

Transactions on Wednesday, June 5, amounted to almost 780,000 shares and the declines in many prominent issues ranged from five to seven points. Europe is estimated to have sold over 100,000 shares in American stocks on this day, and these heavy foreign sales, coming on top of a market greatly weakened by the pressure of domestic liquidation, developed a highly critical situation. The explanation of these European sales is that the New York market at the present time, weak though it is, is strong in comparison with foreign markets and offers the best place for the liquidation of securities on a satisfactory basis. Americans are prone to overlook the importance of foreign supply and foreign demand which are most potent influences upon security values in this country.

The foreign security markets, as above remarked, are at this time in an exceptionally depressed condition. Out of the total of $134,000,000 of high grade securities offered in London during May, less than $15,000,000 was subscribed by the public, the balance being left in the hands of underwriters. The only issue which was well received abroad was the Chinese loan which was offered on a five per cent basis with the backing of five great powers.

Since peace has been signed between the Balkan allies and Turkey, the political tension has been relieved, but pressure is still being exerted upon Bulgaria and Servia to induce them to compose their differences. Apprehensions of a renewal of hostilities in the Balkan Peninsula will not be allayed until the armies of Bulgaria, Servia and Greece have been put on a peace footing. Later in the month the stock market was again adversely affected by the announcement in the Minnesota rate cases. Liquidation had, however, spent its force and the closing days of the month have seen a recovery to higher values upon a small amount of transactions.

High Yields on Stock.

IT is interesting to note the high yields which many leading stocks now offer the investor At the low point on June 5th Amalgamated Copper yielded 9 per cent, Atchison 6.3 per cent,

Digitized by Google

Baltimore and Ohio 6.5 per cent, Brooklyn Rapid Transit 6.8 per cent, Illinois Central, 6.3 per cent, Lehigh Valley 6.7 per cent, New York Central 6.1 per cent, Southern Pacific 6.5 per cent, Union Pacific 7 per cent, United States Steel 9.3 per cent, United States Steel preferred 6.7 per cent. The prices indicated by these yields are too low and are already beginning to attract the bargain hunters who wait for such favorable opportunities before taking their money out of high grade bonds or out of a savings bank. We believe that stock values have reached the bottom.

The Bond Market.

JUNE has been an unusually bad month in the bond market. During the first two weeks the average price of twenty-five representative railroad bonds declined nearly a point. Since the first of the year this average shows a decline of 4½ points. The principal news events of the month in railroad bonds was the sale by the Baltimore and Ohio of $20,000,000 one-year 5 per cent notes, and the sale of an equal amount of 5 per cent notes by the Southern Pacific. The Baltimore and Ohio sale was made necessary to take care of $11,557,000 Cincinnati, Hamilton and Dayton notes maturing on July 1st, which the Baltimore and Ohio had guaranteed. The Pennsylvania also offered $19,700,000 equipment certificates on a five per cent basis.

Several bond issues of the second class showed serious declines, a fall in Rock Island collateral 4 per cent being the most serious. At the lowest price reached, these collateral trust bonds yielded over 8½ per cent, a lower price than during the panic of 1907. A decline in these securities has aroused much uneasiness. A similar fall in the issues of the St. Louis and San Francisco presaged a receivership. It is not believed, however, that the Rock Island Railroad Company will default on its bonds. The railway system is now earning a sufficient amount to pay interest and is doing much better than last year. A default on these collaterals, moreover, would probably result in a loss of control by the present interests and the sale of the railway company's stock which is deposited as collateral for the bonds. The sale of this stock would not pay off the bonds, and would wipe out the $90,000,000 Rock Island Company common and $50,000,000 preferred. It is evident that if a default can be avoided the controlling interest of the Rock Island will not permit it to occur.

Missouri Pacific securities have been under pressure in spite of the fact that the earnings of the company are at the highest point in its history. Its 5 per cent notes due June 1st, 1914, have been sold on a 12 per cent basis which would indicate the imminence of serious trouble. The reason for these low figures is to be found in part in the apprehensions concerning the Denver and Rio Grande. The Missouri Pacific owns about 40 per cent of the Denver and Rio Grande stock and this company owns a majority of the stock of the Western Pacific. The Western Pacific has had to call upon the Denver and Rio Grande to make up a deficit in its earnings in order to pay the interest on its bonds. The Missouri Pacific has $25,000,000 of notes coming due next June. These are the notes which have sold at such low prices. These notes while secured in part by St. Louis and Iron Mountain bonds and notes, and by Texas and Pacific stock, are also secured by $9,800,000 preferred and $15,000,000 common stock of the Denver and Rio Grande. Any difficulties experienced by that company would have a serious effect upon the credit of the Missouri Pacific. It is not believed, however, in view of the splendid showing which the Missouri Pacific is making that it will have any difficulty in financing its maturing requirements.

The Frisco Receivership.

THE Frisco receivership did not occasion surprise. On May 27th, Thos. H. West, chairman of the board of directors of the St. Louis Trust Company, and B. L. Winchell, president of the company, were appointed receivers by Judge Walter H. Sanborn. The petition was made in the name of Mr. West and other directors. It was based on the admitted inability of the railroad to meet a loan of $2,250,000 maturing on June 1st. About the same time the Chicago and Eastern Illinois, the principal subsidiary of the St. Louis and San Francisco, was placed in the hands of Wm. L. Jackson, vice-president of the company, and Edwin W. Winters, of New York.

Much bitterness of feeling has been aroused abroad by this receivership. Speyer and Company, who have acted as the principal bankers for the company, have placed more than $30,000,000 of the general lien 5 per cent bonds in Paris. Only a month ago $3,000,000 of these bonds were disposed of to French investors. The bankers feel that an explanation is due them and this feeling is general. More protective committees have been announced since this receivership than in the case of any other railroad failure. It is believed that a thorough investigation of the affairs of the road will be necessary to re-establish the confidence of the investors in this property. Speyer and Company stated publicly that the railroad management had put the road into receivers' hands without consulting them, and they opposed the appointment of the receivers who were selected. It is impossible, at this time, to forecast the action which the receivers will take, other than that they have already begun drastic retrenchment in expenses and that the usual issues of receivers' certificates for current needs will be made.

The principal interest centres in the position of the general lien 5 per cent bonds of which $67,605,000 are in the hands of the public. These bonds are practically a first lien on 1,073 miles of road, and an inferior lien on about 4000 miles additional. They are also secured by liens on certain stocks and leasehold interests and junior liens on equipment and terminals. For the first nine months of the present fiscal year the Frisco earned a surplus over interest charges, including interest on general lien bonds outstanding on March 1st, 1913, or $2,267,534. On the basis of earnings the company is fully solvent. Its capital structure has, however, been badly planned and contains an excessive amount of debt.

Chicago and Eastern Illinois Receivership.

THE receivership for the Chicago and Eastern Illinois is a creditors' proceeding for the conservation of the property. It is not believed that this will result in a foreclosure. The company has a small floating debt and various equipment trust notes maturing in the near future. This indebtedness can be easily financed.

Digitized by Google

The present intention of the large stockholders in the Chicago and Eastern Illinois is to separate that company from the Frisco. Neither company has profited by the alliance. The Chicago and Eastern Illinois has not furnished the ten per cent which the Frisco guaranteed on its stock and it is claimed that the smaller company has not benefited by the control. By the terms of the contract which gave the Frisco a controlling interest in the Chicago and Eastern Illinois, the original holders of the stock may recall it at any time. They have the option of returning the Frisco's notes and buying control back at par, or waiting until 1940 and receiving bonuses of $150 for each share of common, and $50 for each share of preferred which was originally transferred. The plan suggested by Mr. H. W. Lyford, counsel for the receivers, is to persuade the original holders of the stock trust certificates to return these to the St. Louis and San Francisco and take back the ownership of the property.

Effect Upon Foreign Investors.

AN unfortunate influence from the embarrassment of the Frisco is the injurious effect which the affair will exert abroad. American railroads must rely for a long time upon foreign capital to supplement domestic resources. The effect of the receivership in Paris is suggested in an interview cabled to the *Herald* by an officer of the Bourse, M. de Verneuil, in which he said: "The United States is a great country and its resources are immense and inexhaustible. I have not changed my opinion regarding the values of the country, but I have changed my view of the moral worth of some of its citizens.

"The methods of some American financiers have done a great harm to French investors, whose assistance they often have solicited and who have been only too ready to open their pockets to foreign enterprises.

"I am very much afraid that as a result of the ill advised conduct of these American financiers other American stocks, even those above suspicion, no longer will be accepted by the French public."

Review of General Situation.

THE collapse of one of the weak roads has directed attention to other companies concerning whose finances questions have been raised. No reason exists to anticipate trouble from earnings being sufficient to pay interest. The only difficulty that is likely to be experienced is from the maturity of principal. There are no other important companies, however, which are in the situation which confronted the St. Louis and San Francisco. The maturing obligations for the remainder of the year are well cared for. The Atlanta, Birmingham and Atlantic, and the Wabash receivers must take care of large issues of receivers' certificates this summer, but since these are practically prior liens on the property no trouble will be experienced in handling them. The New York, New Haven and Hartford has $10,000,000 of 5 per cent notes due December 1st. This company has, however, so wisely managed its credit that it can place underlying liens on some of its most valuable property to secure first mortgage bond issues if necessary. The $45,000,000 of Baltimore and Ohio 4½ per cent notes due on June 1st were taken care of by the sale of 4½ per cent bonds early in the year. Boston and Maine took up an issue of 4 per cent notes with 6 per cent notes. The Cincinnati, Hamilton and Dayton 4 per cent notes have been taken care of by the recent Baltimore and Ohio issue, mentioned elsewhere, and the Nashville, Chattanooga and St. Louis 6 per cent notes, provided for by a recent stock issue. Other maturities remaining are $4,000,000 Hocking Valley 4½ per cent notes due November 1st, and $2,880,000 Frisco divisional first mortgage 5's in addition to equipment obligations. There is nothing in this record which shows any ground for apprehension.

Railway Financing for May.

IN spite of the fact that railroad financing is still on a reduced scale, during May, 1913, according to the table compiled by the *Journal of Commerce*, railroads issued $80,611,000 of bonds, notes and stocks. This is a decrease of $29,000,000 from 1912 but still represents a total which is surprisingly large when financial conditions are considered. It is impossible for railroads to stop construction work already begun, such as the building of sidetracks and the laying of new rails. Equipment which has been ordered must be paid for when received. If bonds cannot be sold then money must be borrowed from the banking interests on short term notes.

Railway Business for April.

THE total operating revenues of the railways for April were $237,362,424, an increase over those of April of last year of $22,893,968 in the aggregate, or 9.7 per cent per mile of line. This was whittled down by an advance in operating expenses of 12.3 per cent per mile of line to an increase in net operating revenue of $1,834,073 in the aggregate, or 2.4 per cent per mile of line.

The amount of this net operating revenue was $58,337,434. Taxes for the month took $10,482,492, an increase per mile of line of 7.9 per cent; this and shrinkage in revenue from outside operations left operating income amounting to $47,516,273, an increase of $810,427 or less than one per cent per mile of line. This aggregate operating income for the 222,156 miles amounts to $214 per mile of line for the month, or $7.13 per mile of line per day.

It is the operating income to which the railroads must look for betterments, improvements, new construction, and for interest on bonds and dividends. Except for the fact that there was an anthracite coal strike in April of last year, this operating income for the railways as a whole would not have averaged an increase, and for the railways of the Eastern group would have been less this year than last, instead of increasing 14.6 per cent. It was lower per mile of line for these railroads in April, 1912, by 33 per cent than in April, 1911; and 3.8 per cent greater in April, 1911, than in April, 1910. For the railways of the Southern group this operating income per mile of line was 16.5 per cent less than in April, 1912; less in April, 1912, by 1.9 per cent than in April, 1911; and less in April, 1911, by 14.5 per cent than in April, 1010. For the railways of the Western group this operating income per mile of line was 3.2 per cent less than in April, 1912; greater in April, 1912, by 2.1 per cent than in April, 1911; less in April, 1911, by 12.3 per cent than in April, 1910.

Operation

Recent Accidents.

IMPELLED by a peculiar wave of sentimentality, the railroads of the country are at the present time receiving censure—much of it undeserved—concerning train accidents. Psychologists have been unable to offer any scientific explanation for these peculiar outbursts of popular opinion which, founded as a rule upon some slight incident, quickly assume the greatest proportions, running frequently to heedless extremes.

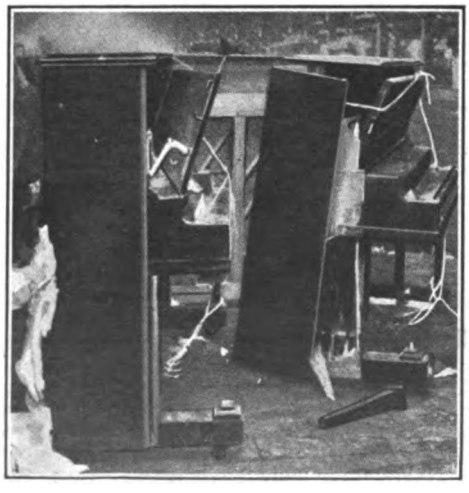
The immediate cause of the wide-spread agitation against the railroads as regards accidents which has sprung up within the last few days, monopolizing an undue amount of newspaper space, was the wreck which occurred on the New Haven system at Stamford, Connecticut, on June 12th. The accident was the result of a collision between the first and second sections of the Springfield express in the railroad station at Stamford, Conn.

It is too early, in advance of the official investigation by the railroad and by the Interstate Commerce Commission and Connecticut Public Utilities Commission, to locate definitely the real responsibility for the collision. The facts, so far as known, are that the first section was standing in the station when the second section, disregarding the danger signals set against it, crashed into the first section, telescoping the Pullman car attached to the rear of the first section, killing six persons and injuring a number of others. The engineer's defense is that he had previously written in the work book of the Stamford roundhouse "Brakes no good—won't hold"; that he had sprained his back on the previous day while endeavoring to reverse his engine, and that when he saw the accident was imminent, he was unable, because of the injury and the great amount of strength required, to throw over the reverse lever, and hence could not prevent the accident.

On June 17th, the New Haven made a trial run with the same engine which figured in the wreck, after slight repairs had been made, to demonstrate to the representatives of the Interstate Commerce Commission and the Connecticut Public Utilities Commission, that the fault did not lie in the locomotive. According to the newspaper reports, however, the engineer selected to make the test failed to bring the locomotive to a standstill at the point selected in the Stamford Station, the train running about five car lengths beyond this point. Thus, while the accident was plainly due to the carelessness of the engineer in running past both his distant and home signals set against him—about which there is no dispute—public opinion has turned the case against the railroad on the ground that the accident was due to carelessness in making repairs.

Everyone concedes that the New Haven has been peculiarly unfortunate in the last two years as regards wrecks. The accident at Stamford makes the thirteenth serious wreck since June 1st, 1911. The New Haven has been spending an enormous amount of money in endeavoring to prevent such catastrophes. The company has met, in so far as practicable, every requirement or suggestion of either the Interstate Commerce Commission or the several State Commissions with reference to the improvement of its signal system, the elimination of short cross-overs and such other matters as are directly or indirectly responsible for accidents.

The country should not lose sight of the fact that the New Haven is operating in a very densely populated territory, that a very high train mileage per mile of track results, and that the likelihood of accidents is thereby tremendously increased. It must also be borne in mind that the New Haven is in the forefront in investigating such questions as automatic train stops and other matters which it is hoped will bring about a permanent solution of the collision problem.



EFFECT OF UNDESIRED QUICK ACTION IN A CAR LOT OF PLAYER PIANOS.

Commission's Accident Bulletin.

THE Interstate Commerce Commission, in its Accident Bulletin No. 46, covering the quarter ending December 31, 1912, reports that defective roadway and defective equipment cause 71.6 per cent of the derailments of steam railway trains. Of the derailments due to defective roadway, 23.8 per cent were caused by broken rails, and of the number caused by defective equipment, 26.5 per cent resulted from defective wheels.

There was an increase in the quarter, as compared with the corresponding quarter of 1911, of 527 in the number of train accidents. The number of collisions increased 433 and the number of derailments 215. There was an increase of 135 in the number of persons killed and 1,107 in the number injured over the corresponding quarter of 1911.

There is no doubt that the country is becoming increasingly sensitive concerning railway accidents and that this sensitiveness extends not only to the public at large but to scientific bodies from whom calm and impartial judgment may be expected. The American Society of Mechanical Engineers, at its meeting held in Baltimore, on May 24th, briefly discussed the accident prob-

Digitized by Google

lem, and it was the almost unanimous consensus of opinion of those who spoke that the railroads should devise and speedily adopt some mechanical contrivance which would tend to prevent accidents.

Reflecting the popular interest in the matter, a bill was introduced in the House of Representatives at Washington on June 24th, by Representative Roberts, of Massachusetts, requiring all railroads engaged in interstate commerce to use fireproof steel cars and to equip their lines with automatic switches, signals and such other safety contrivances as may be approved by the Interstate Commerce Commission. The bill holds officers, directors and operating officials as well as the companies responsible for violation of these regulations, and provides fines from $500 to $10,000 and prison sentences from thirty days to one year as penalties for infractions. The companies are given four years in which to equip their lines with steel cars, at least twenty-five per cent of the equipment to be installed each year. Complete installation of safety devices is to be made within two years.

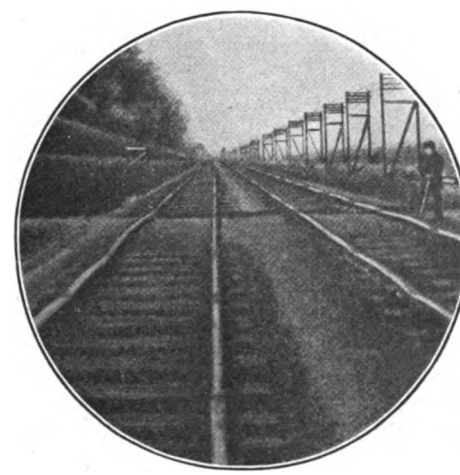
Record of the Pennsylvania.

STRONG evidence in support of the safety of American railway operation is furnished by the statistics compiled by the Pennsylvania Railroad for the year 1912, which were made public on June 16th. This system operated during that period 837,121 trains, which covered an aggregate distance of 40,000,000 miles, carrying, all told, 100,000,000 people or more than the entire population of the United States. Out of this striking total, only two trains suffered wrecks causing loss of life. During the five years 1908 to 1912 inclusive, sixteen passengers lost their lives in accidents to trains, while the system for that period carried over 500,000,000 passengers, or a number equaling one-third of the population of the entire world. Of the passengers injured in 1912, 321 were hurt getting on and off trains, 25 in falling while on railroad property in front of other than trains. There were 212 passengers injured as a result of train accidents. Of these, 155 were injured in the two wrecks in which four passengers were killed.

The Pennsylvania has made a careful analysis of all of the accidents, both trivial and serious, during the year 1912, and finds that probably twenty per cent of all accidents could have been prevented if employes had exercised special caution. The Pennsylvania Railroad Company has prepared a book called "Safety Hints and Suggestions for the Prevention of Personal Injury and Accidents," of which one hundred thousand copies are being distributed among officers and employes of the system. This book contains the results of a painstaking investigation of thousands of accidents and points out in a forceful manner the way in which the great majority of those which occurred could have been prevented. The safety work on the large railroad systems steadily continues, although during the past month no new innovations or developments of importance have occurred. This work has now reached maturity and is proving of increasing value with the passage of time.

Use of Field Glasses in Inspection of Track.

AN interesting development which has recently occurred in England is the use of field glasses in the inspection of maintenance-of-way work. Even the most experienced railway official has difficulty in inspecting the finer details of maintenance work from an inspection car on the rear of a train moving at ordinary speed. Such features as low joints and imperfect alignment are minimized both by the rapidity of motion and by the position of the observer. In order to overcome this difficulty, English officials have begun the use of field glasses for such work. It has been found that the use of the glasses brings out very clearly many track defects heretofore difficult of location. The accompanying cut shows how sunken joints, for example, are clearly shown with the use of the glasses.



SUNKEN RAIL JOINTS SEEN THROUGH FIELD GLASSES.

New Mail-Catching Devices.

NOTICE from the postal authorities in Washington has been received to the effect that improved devices for delivering and catching mail sacks must be installed. Two devices have been chosen by the government, one of which must be adopted, although there are four other patents pending, and it may be that one or more of these devices will be added to the list from which to choose. The step taken by the authorities in Washington does not displease the railroad officials, as they have often stated that they were desirous of having a standard device prescribed for them, and in that way eliminate the possibility of sudden changes at the will of the different officials who become convinced that another device is preferable to the one which they happen to be using at the time.

Use of Crude Oil as Engine Fuel.

IT is estimated that more than 32,000,000 barrels of crude oil were used by railroads of the United States for fuel in 1912. This was an increase of more than 4,000,000 barrels over 1911. During the last few years, crude oil has replaced coal for fuel on the locomotives

Digitized by Google

upon many of the railroads in Texas, Oklahoma and Louisiana.

The total mileage of railroad now operated with fuel oil is about 28,000 miles. The adoption of oil for fuel by many of the roads has added greatly to the comfort of the traveling public, has lessened the labor of the firemen, and has greatly reduced the cost of operation. More than 1,200 oil burning locomotives are in use on the Southern Pacific and more than 800 on the Santa Fe.

Pennsylvania Railroad to Use Wireless.

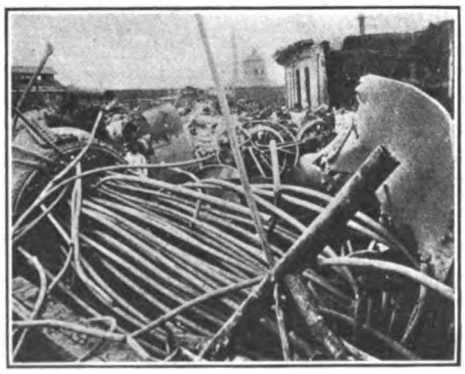
IT is currently reported by the newspapers that the Pennsylvania Railroad will soon establish a wireless telegraph system connecting Pittsburgh, Philadelphia, Altoona and Harrisburg, the division points on the main line. Plants will be established at Altoona and Philadelphia immediately. If successful, the system between these two points will be installed at all of the principal stations on the line.

One purpose of the wireless system will be to guard against "wire-down" and storm trouble during floods. With wireless, the company can communicate with its division points in any kind of weather. Work on towers and installation is expected to be started in Philadelphia and Altoona within the next few weeks.

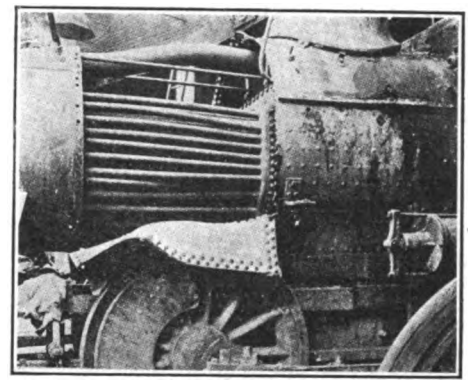
Boiler Inspection.

MR. GARLAND P. ROBINSON, of the Interstate Commerce Commission, gave an illustrated lecture on boiler inspection at a recent meeting of the Richmond Railroad Club. After reviewing the statistics of boiler accidents collected by the Commission, in which it was found that out of 74,234 locomotive boilers inspected, 3,377 locomotives had to be ordered out of use and 48,768 were in some degree defective. Mr. Robinson proceeded to analyze the most common causes of accidents. These he found, in the order of their importance, to be (1) defective squirt or sprinkler hose, (2) water glass accidents, (3) low water, and (4) carelessness in setting safety valves.

He stated that the aim of the Commission at the present time was to eliminate or reduce the frequency of these accidents through better inspection and by securing the co-operation of the railroads in educational work. He stated that practically all of the accidents due to defective squirt or sprinkler hose were preventable, and that a



THE TERRIBLE EFFECT OF EXCESSIVE STEAM PRESSURE.



IN THIS CASE THE SAFETY VALVE WAS WORKING AT THE TIME OF THE EXPLOSION; THE ACCIDENT WAS DUE TO AN INSUFFICIENT FACTOR OF SAFETY—CALCULATED TO BE 3.44.

number of companies were engaged in experiments with air-operated hose. As regards the accidents due to the breaking of water glasses, he stated that while the Commission allowed the use of wire net under certain conditions, yet it was not recommended because it did not always prove effective in cases of accident. The only remedy for low water explosions is careful inspection and repairs. The operation of locomotives with defective parts causes the engineer to be misled as to the amount of water in the boiler and brings disaster. Carelessness in setting safety valves is something which cannot be guarded against except by inspection.

One of the most interesting features of the lecture was the illustrations showing the results of typical boiler explosions. We reproduce herewith some of these illustrations which bring out in an effective way both the weak points of the locomotive and the terrific effect exerted by an explosion.

Examples of Absurd Legislation.

THE past winter, in which the legislatures of many States have been in session, has brought out an unusually large crop of absurd bills to regulate railways. Comparatively few of these bills ever emerge from the committee in which they are buried. It is amusing and interesting, however, to notice the extent to which these vagaries go. In a number of legislatures champions of the "no-seat, no-fare" theory forged to the front, while in others various means for better sanitary rules on trains and in railway depots were discussed. In Michigan a member of the legislature introduced a bill intended to prohibit spitting on radiators in railway stations. One member of the legislature of North Carolina urged that all railroads operating in that State be required to place cuspidors before each seat. An effort was made by a member of the Wisconsin legislature to obtain the passage of a law requiring railways to equip baggage and express cars with cots for sick and injured persons.

Eastern Illinois to Promptly Adjust Freight Claims.

A CIRCULAR has been issued to shippers and connecting lines, over the signature of the General Freight Agent of the

Digitized by Google

Eastern Illinois Railroad Company, stating that "the question of prompt payment of freight claims presented by our patrons and likewise of the Chicago and Eastern Illinois Railroad's proportion of freight claims settled by connecting lines having arisen, on authority of receivers Jackson and Winter, the receivers shall continue uninterruptedly to adjust promptly and in full all freight claim obligations (both local and interline) both prior and subsequent to receivership. W. H. Emerson, acting freight claim agent, with office at 7708 Wallace Street, Chicago, is in charge of loss and damage freight claim matters. W. A. Ragel, freight accountant, with office at 7720 Wallace Street, Chicago, is in charge of overcharge claim matters."

Contract Form for the Purchase of Coal.

THE fifth annual convention of the International Railway Fuel Association held in Chicago, May 21st to 24th, was given over in part to the discussion of the proper form of contract for the purchase of coal by railroad companies. Mr. Francis S. Peabody, president of the Peabody Coal Company of Chicago, stated that the maximum and minimum clause of the existing contracts was causing great inconvenience to the mine operator, as the roads were inclined to demand the maximum tonnage at the time when it was most inconvenient for the operators to supply it. He stated that the railroads should store four months' supply during the storage period both in order that they might take advantage of the decrease in traffic and the lower cost for transportation, and because it would keep the mines busy during the dull season. He recommended a storage yard with trestles and steam shovels for loading, and stated that the cost of storage would amount to only 15 cents per ton,—2 cents for unloading, 3 cents for loading, and 10 cents for depreciation.

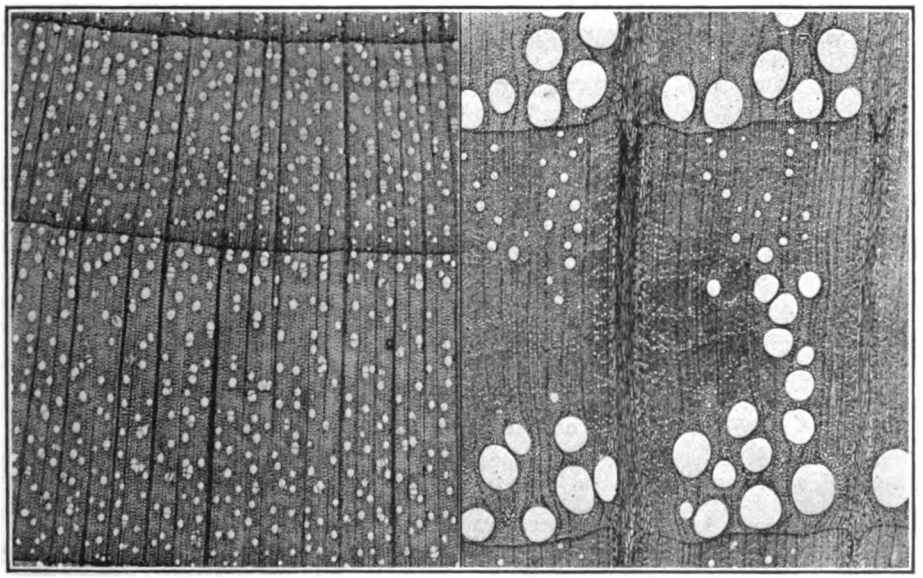
Mr. J. G. Crawford, of the Burlington system, as chairman of the committee in charge, presented a proposed form of contract for the purchase of railway fuel coal. The discussion concerning the proposed contract brought out a difference of opinion as to whether it was advisable to mention in the contract the number of cars to be supplied at the mine by the operator. Another question which was discussed was what provision, if any, should be inserted in the contract concerning coal which was not up to the standard but which might, nevertheless, be used by the railroad with a reasonable degree of satisfaction.

Other suggestions which were made were that the contract should include specifications as to the fusing of the ash, the heat value, the percentage of ash in the coal, and a standard method of obtaining samples.

Mechanical

ADDITIONAL CROSS-TIE PRESERVATIVE EXPERIMENTS.

FOLLOWING up the experimental work which has recently been completed and published concerning the advantages and the effect of preservative treatment of cross ties, the United States Forest Service has published a bulletin outlining an extensive series of experiments relating to red oak and hard maple cross ties. These experiments are to be conducted in conjunction with the University of Wisconsin and the Chicago, Milwaukee and St. Paul Railroad Company. The ties used in the experiments are ordinary stock of the St. Paul, 100 of each of the two species being treated by each of six processes. The 600 red oak and 600 hard maple ties, together



MAGNIFIED CROSS SECTION OF HARD MAPLE. MAGNIFIED CROSS SECTION OF RED OAK.

The above cuts show the greater absorption of the preservative by the hard maple tie. This condition prevailed with other processes except the Rueping process.

with 100 untreated ties of each species have been laid side by side in a typical stretch of track. The Bulletin (No. 126) describes in detail the conditions under which the ties were laid and the history of each class of tie at the time it was laid. The track selected was part of a single track road carrying a fairly heavy traffic in both directions. The ties were laid on gravel ballast, well drained. Nearly all of the treated ties were placed on a fill but a few included in the test were laid in a cut. Screw spikes with flat tie plates were used on one half of the ties, the balance being unprotected by tie plates and fastened with ordinary cut spikes.

It is the intention of the Forest Service to carefully watch these ties and to ascertain what service they will give. A large portion of the Bulletin consists of a description of the various processes used in the treatment of these ties, including drawings and photographs of the apparatus used.

LIGHTING SPECIFICATIONS FOR FULL POSTAL CARS

THE Special Committee on Relations of Railway Operation to Legislation submitted a report (Bulletin No. 44) on January 14th last, containing general lighting specifications for steel full postal cars, which were presented, in summary, in the RAILWAY WORLD for February.

The committee has issued under date of January 9th, full specifications concerning the planning and construction of full postal cars, which are in reality a guide to the car builder in carrying out the general plan formulated by the committee and heretofore reported. The specifications cover every detail of the car's construction, giving detailed dimensions, plans and specifications concerning its building and fixtures.

The committee recommends that except where a very high standard of cleaning maintenance is obtained and where the deterioration of illumination under service conditions is known, that higher initial illumination values be used than are called for by the specifications. From 45 to 55 per cent deterioration before reaching the specification minimum service illumination values for porcelain enamel reflectors, and from 55 to 65 per cent deterioration for aluminized metal reflectors, should be allowed. To obtain satisfactory results, two designs of reflectors are desirable—one an extensive or distributing type of reflector for the body of the car, and the other a concentrating type for the letter cases. The tests showed that the aluminized metal reflector is best adapted for postal car illumination.

TESTS OF VARIOUS CLASSES OF PAINT ON RAILROAD BRIDGE

THE results of a six-year test of various classes of paint for steel on the Pennsylvania bridge at Havre-de-Grace, Md., made by the American Society for Testing Materials, has recently been made public. In all, nineteen different paints were applied to various parts of the bridge structure and to special plates attached thereto at the definite spreading rates of 600, 900 and 1,200 square feet to the gallon. For the test steel plates two by three feet that had been pickled in acid neutralized in soda solution and washed and packed in lime until the moment of painting were used. Three plates for each of the nineteen paints were given three coats at each spreading rate. The work was accurately done in a shop erected for the purpose.

The paint was applied early in 1906. Frequent examinations of the work were made by the standing committee of the American Society for Testing Materials, records being made at the time of

each examination both as regards the progress of destruction and the relative wearing qualities of the paint. Mr. George S. Rice, of New York, in his report concerning the results of the test, states that with very few exceptions the paints applied to the bridge structure itself are now in better condition than those applied to the steel plates that had been chemically treated. This he attributes to the heavy spreading rate employed on the bridge naturally making a thicker coat. Prof. Lewis H. McFadden, in commenting upon his examination of the surface covered with the various paints, declares that in his judgment practically all of them have now served their ordinary commercial life, although it is probable that a few of the paints will continue to afford protection for from two to four years longer.

The paint which, in the judgment of the three members of the committee (the third member being Mr. John R. Demsey) had most completely protected the surface to which it was applied was known in the report as "No. 6," and had been submitted for the test by Lowe Brothers Company. In commenting upon the formula of this paint, the committee states that "It consisted of a red lead preparation for the priming coat, a carbon paint for the top, and a mixture of the two for the intermediate coat. This philosophy, which consists in producing a solid, sufficiently elastic foundation with rust inhibitive properties by a priming coat of red lead, followed by a transition coat of intermediate in elastic quality between the primer and top coat, whose office is essentially protective of the undercoats, is amply justified in the behavior of paint 6.

"It would be unfair not to recognize the fact that several paints are giving notably good service on the steel plates, and better service on the bridge itself. But our conclusion, deliberately arrived at repeatedly and critically going over the entire series of tests and inspecting the various members of the bridge, is that paint 6, supplied by The Lowe Brothers Company, measures distinctly higher than any other paint of the nineteen embraced in the test, in efficient protection for six

years of service, in general appearance of surface and in promise of continued service."

Mammoth Coal Unloading Dock of Canadian Pacific.

A MAMMOTH coal unloading dock has recently been installed by the Canadian Pacific at St. William, Ont. The unloading

equipment while generally similar to that employed in most plants of this character, is unique in that it employs the same principles for the handling of coal which have been worked out successfully heretofore in connection with the handling of ore. The advantage of using the machinery designed for the handling of ore is that it will not break up the coal as much as the ordinary coal-handling machinery, the larger pocket in the aggregate being more economical. The pocket used in connection with this plant has a capacity of nine tons and a total travel of 485 feet 8 inches, while the bridge which carries it can be moved 2,890 feet along the runways. We reproduce herewith a cut showing a general view of the dock.

NOTABLE CANADIAN BRIDGES

AT the present time there are in course of construction two notable bridges in Canada. The most famous of these is the Quebec bridge over the St. Lawrence, taking the place of the ill-fated structure which collapsed some years ago and became a matter of universal interest not only to engineers who were seeking for the cause therefor, but to the public at large as one of the catastrophes of the time. The new structure now in process of erection, and which it is confidently believed can be successfully completed, has a total length of over 3,200 feet, or almost three quarters of a mile. The span of the bridge, as between the two piers located in the river on either side of the main channel is over 1,800 feet, or more than one third of a mile. The height in mid channel is 150 feet in the clear. Approximately 60,000 tons of steel will be used in the construction of the bridge. The erection of the bridge requires the construction of a large and expensive fabricating plant at the river side, requiring a main building 660 feet long and of an average width of 160 feet. A stock yard of extensive capacity is equipped with large crane runways together with machinery of all classes such as would be useful in such work. In all, over 109 machines or mechanical appliances have been installed. The work of erection is being done by the St. Lawrence Bridge Company, Limited.

Another notable bridge which will revolutionize transportation conditions in Canada is that recently completed by the Canadian Pacific Railway at Outlook, Saskatchewan. The bridge crosses the South Saskatchewan River and has a total length of 3,004 feet, with an elevation above normal water level in the river of 147.25 feet. The bridge is carried on heavy concrete abutments, the central pier being over 125 feet in height above water level. The central spans of the bridge—eight in number—are 240 feet each in length. The accompanying illustrations show the size and general characteristics of both structures.

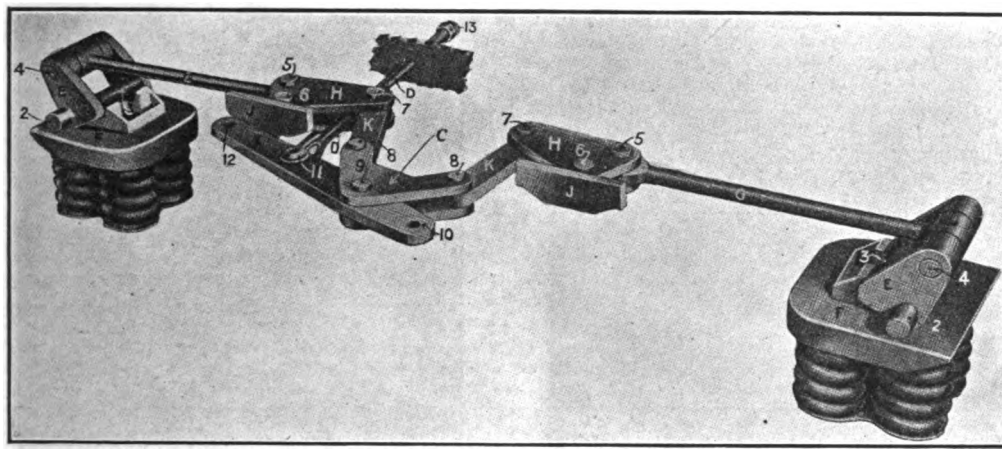
NEW TYPE OF VARIABLE LOAD BRAKE

AN improved type of Bettendorf variable load brake has been recently placed upon the market. This device was shown at the convention of the Master Car Builders a year ago and attracted considerable interest. Various objections were found in practice, however, to the device as then constructed. The new type aims to eliminate these objections and increase the wearing life of the brake.

The principle of the device is that of applying the cylinder and lever portions for the desired load-weight braking power and of utilizing a series of parts as a fulcrum for one of the levers. This fulcrum will not move unless the brake-cylinder force becomes equal to some predetermined percentage of the downward force due to the weight of the car body and the load thereon. When the force exceeds this predetermined amount, the car body will be lifted, thereby preventing any additional pressure upon the brake shoe and, theoretically, at least, avoiding the locking of the wheels, with the attendant injury thereto. In brief, the plan is to proportion the force of the braking pressure to the weight of the car and its load, which both in theory and in practice is the

Digitized by Google



ASSEMBLY OF PARTS COMPRISING BETTENDORF VARIABLE LOAD BRAKES.

principle which should control correct braking. The advantages claimed for the equipment are that it permits of an increased load-weight brake power when the car is loaded, while when it is empty the brake power is proportionately decreased. If only one end of the car is loaded (as, for example, in hauling long steel beams extending over two or three cars), it is possible to have increased brake power for one truck without correspondingly increasing the power on the truck bearing little or no load. In addition, it is claimed that there is less likelihood, with the use of this brake, of pulling trains in two from emergency applications.

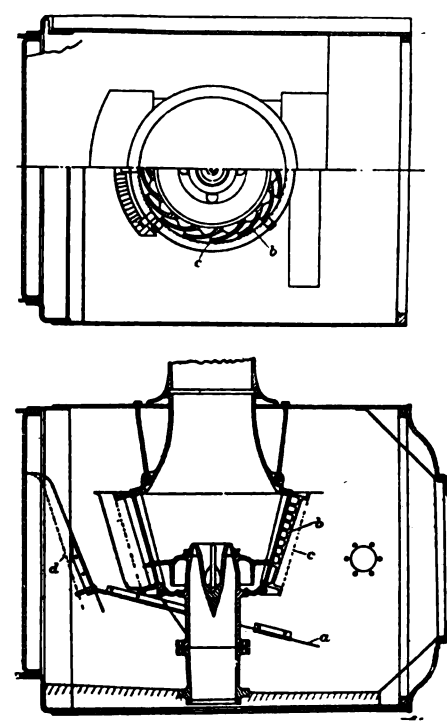
SUB-BITUMINOUS AND LIGNITIC COAL AS LOCOMOTIVE FUEL.

MR. SAMUEL B. FLAGG read a very interesting paper at the meeting of the International Railway Fuel Association held in Chicago on May 21st, on "Sub-Bituminous and Lignitic Coal as Locomotive Fuel." After reviewing the chemical differences between this type of coal and that of higher grade, and contrasting its theoretical heat-producing power with more commonly used fuel, Mr. Flagg proceeded to discuss some of the operating problems which arise from its use.

The lower heat value of the fuel requires a larger firebox in order to develop the required horsepower, and also necessitates additional grate area, placed by some authorities as high as 50 per cent. The tendency of the coal to cause additional resistance of the fuel bed to the flow of air necessitates high draughts, requiring additional exhaust pressure. This has a tendency to reduce the efficiency of the locomotive from 5 to 10 per cent. In addition, one of the greatest problems connected with the use of this fuel is the prevention of spark troubles arising in part from the high draughts and in part from the absence of a clinker tendency on the part of the fuel.

Various devices have been tried to overcome the spark problem. Mesh screens arranged in different ways have been tried, but almost without exception they have been unsatisfactory, both becoming clogged and readily burning out. The American Locomotive Company has worked out an arrangement to reduce the size of sparks and cinders and to delay their delivery from the stack till they cool sufficiently to prevent their being dangerous. The general nature of this device is shown in the accompanying illustration. Through the use of baffle and deflector plates and a four-inch mesh net, the size of the sparks is so reduced as to give no trouble in operation.

Mr. Flagg states that a number of these locomotives have been in service on Western lines for as much as four years, and that in this time no fires have been traced to locomotive sparking.



FRONT END ARRANGEMENT FOR LIGNITE BURNING LOCOMOTIVES.

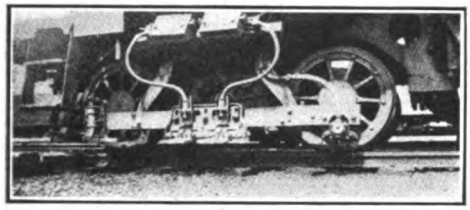
AUTOMATIC STOP RESULTS IN PENNSYLVANIA TUNNELS

ELECTRICAL engineers and railway operating officials have been much interested in the results which time would demonstrate would be secured with the electric trip device adopted by the Pennsylvania Railroad in connection with its New York tunnels. This corporation experimented, before the tunnels were placed in operation, with the type of trip used in the New York subway and in connection with the tunnels under the Hudson and East Rivers. It was found, however, that these trips, while satisfactory in the work in which they had heretofore been used, could not stand the hard blows resulting from the contact of the train, running at 60 miles per hour, with the trip.



THIRD RAIL SHOE BEAM, ELECTRIC LOCOMOTIVE PENNSYLVANIA RAILROAD.

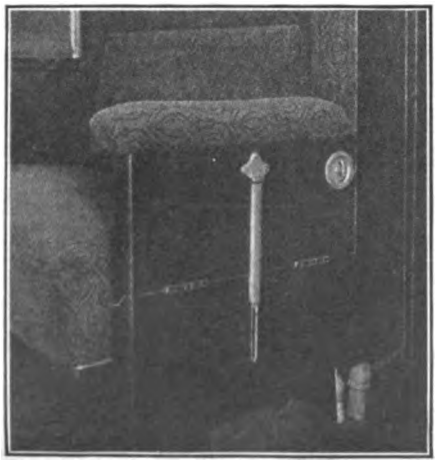
Fig. 1 shows the third rail shoe-beam of the electric locomotive to which is attached the air-valve, which is mounted at the extreme right.

Fig. 2 shows the trip at danger position. A casting on the air valve engages the middle tooth of the trip, rotating it so that the outside tooth will pass between two castings on the air valve, opening the valve and stopping the train. Springs are so placed on either side of the trip that it will be simply pressed down without damage after the valve has been opened and as the engine passes by. This automatic stopping device has thus far given satisfaction in use and it is believed that the experience is sufficient to indicate that it is satisfactory for the purpose for which it was designed.

TRIP AT DANGER POSITION IN PENNSYLVANIA RAILROAD'S HUDSON RIVER TUNNEL.

CONVERTIBLE SEAT FOR COMPARTMENT CARS

THE Pullman Company has recently installed on the Twentieth Century Limited a convertible seat to be used in compartment cars where there is a separate passageway through the car outside of the compartments, into which the berths may be extended. This device gives a wider sleeping car berth than was heretofore possible, greatly increasing the comfort of the passenger and at the same time not decreasing the aisle space during the daytime. The seat ends are hinged so that they can be swung down and supported by an angle brace and form a horizontal extension of the seat. When the two seats are pulled out, as is ordinarily done in making up a lower berth, a filler is placed between the two ends after they have been lowered, thus forming a full sized bed. The nature of the seat end is clearly shown in the accompanying illustrations.



SEAT END LOCKED IN POSITION FOR DAY TRAVEL.

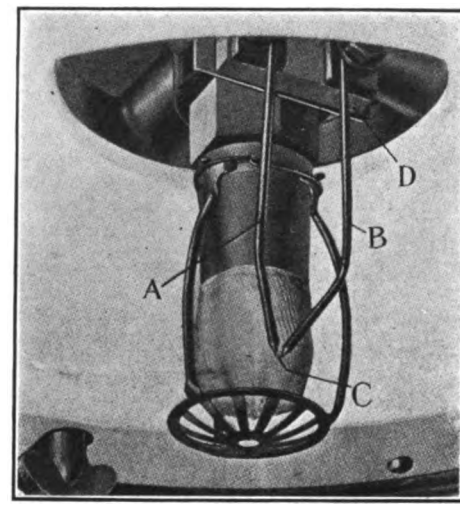
AUTOMATIC GAS LAMP LIGHTER FOR PASSENGER CARS

ONE of the most serious objections to the use of gas lamps in passenger cars has been overcome by a recent device put on the market by the Safety Car Heating and Lighting Company. The use of this device in connection with Pintsch mantle lamps makes possible the lighting of the lamp without the use of the familiar wax taper. The device consists of an electric ignition system controlled by a series of push buttons located at some convenient point in the car. After turning on the gas, the operator pushes the button controlling the lamp it is desired to light, thereby causing a jump spark which will ignite the mixture. It is possible with this type of lamp to light any one or all of the lamps at pleasure without in any way interfering with or annoying the passengers, just as, in fact, is the case with the latest type of electric lamp.

The source of the electric current supply for the ignition system is a dry battery operating in conjunction with a master vibrator and with a spark coil at each lamp to raise the tension of the current sufficiently to make it jump the spark gap. This arrangement obviates the necessity of running high tension wires on the roof of the cars. Two batteries of four cells each are sufficient to operate the system.

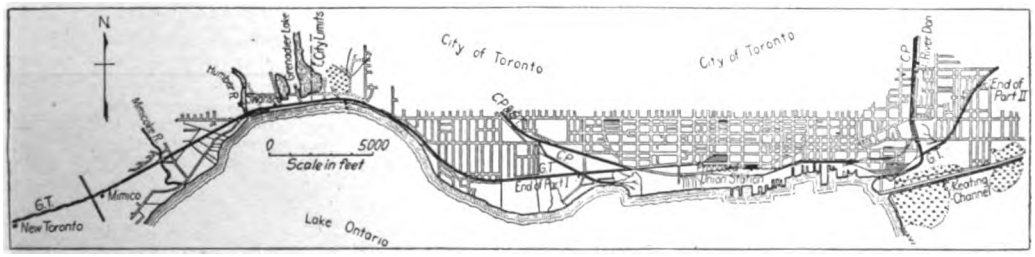


PINTSCH MANTLE WITH SPARK POINTS FOR ELECTRIC IGNITION.

GRAND TRUNK ELIMINATING TORONTO GRADE CROSSINGS

THE Grand Trunk system is engaged in extensive work to eliminate grade crossings in the city of Toronto. The lines entering the city were divided into three sections, one of which is now practically completed. Plans have been approved by the Railway Commission for the elevation of the tracks through the second section—between the Canadian Pacific crossing between Strachan avenue and the point just east of the River Don on Logan avenue—on which all through tracks and overhead tracks are to be elevated, with overhead crossings of all streets. The plan contemplates the construction of a Union station of the through type, with the tracks, equipped with a Bush train shed. The passenger platforms are to be 18 feet wide, while the baggage and express platforms, which are provided between each pair of tracks, are to be 12 feet wide.

The elevated line is to be four-track, the two outside tracks to be used for freight traffic and the inner tracks for passenger service. The work has cost up to the present time about $2,000,000, of which the city has paid one third of the cost of a two-track construction.



Map of Portion of the City of Toronto Showing Grand Trunk Lines on Which Grade Crossings Are Being Eliminated.

From the "Railway Age Gazette."

THE AUTOMATIC TRAIN STOP PROBLEM

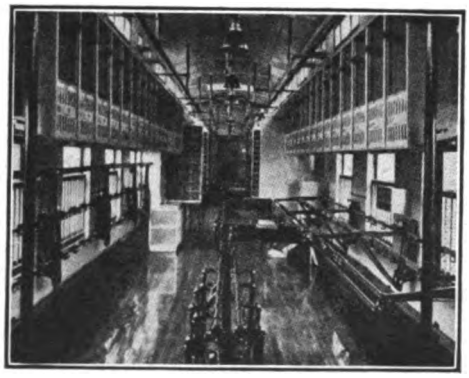
MR. A. H. RUDD, Signal Engineer of the Pennsylvania Railroad, in an article contributed to "The Signal Engineer," discusses in an entertaining and instructive way the nature and extent of: "The Automatic Train Stop Problem." Mr. Rudd analyzed the accident figures of the Interstate Commerce Commission, pointing out that in 4½ years only 46 accidents resulted from a disregard of semaphore signals or about 8.4 per cent of the total number of accidents. According to Mr. P. J. Simmen, of the Commission's staff, 64.8 per cent were preventable by a complete signal system. Accepting this figure, Mr. Rudd concludes that 56.4 per cent would have been avoided by the installation of fixed signals which are needed under any conditions and which in no way con-

Digitized by Google

cern the automatic train stop problem. He pointed out that it was necessary to begin to brake high speed trains 4,000 feet away from the point where the stop must be made and that this has introduced a serious problem, for it would be impossible to locate an automatic stop at the distant signal without interfering with the ordinary handling of the train by the engineer. If the brakes were not to be suddenly set at this point, the automatic stop must be located at the gome signal, and the whole signal system must be so arranged that the train be given 4,000 feet from this point to come to a stand. The operating difficulties which this introduces are of the most serious character.

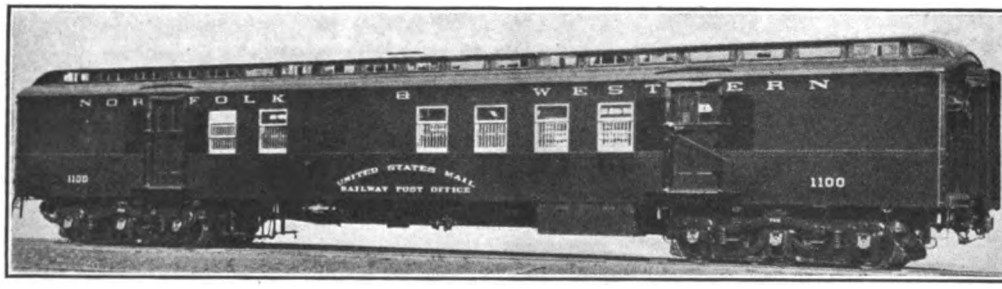
Mr. Rudd stated that stops using electric contact devices are not reliable, even though they seem to work satisfactorily in demonstrative tests. Moreover, the successful stop must be one which works in the worst winter weather and, in fact, under all weather conditions. An automatic stop located at the proper point for fast trains would require slow passenger trains to stop at an unnecessary distance from the danger point and would be even more disadvantageous in connection with freight work. He states that "if any safeguard other than the expansion of the fixed signal system is decided to be necessary, and the money can be obtained, an automatic stop, per se, should not be considered, but attempts should be made to develop a continuously controlled speed controller without contact devices, if possible; so arranged as to leave the control of the train in the hands of the engineman until and unless he exceeds a safe speed." Mr. Rudd, in diagrams accompanying his article, demonstrates that while with a signal system designed for high speed passenger operation a distance or space between trains of about 9,730 feet will be a sufficient minimum, yet with automatic stops this distance would be increased to 13,730 feet. Running under caution signals under twenty miles an hour, the space, under the present system, is 4,705 feet, while with automatic stops it would be 8,705 feet.

NEW STEEL PASSENGER EQUIPMENT FOR NORFOLK AND WESTERN



INTERIOR OF 70 FT. STEEL POSTAL CAR OF THE NORFOLK AND WESTERN RAILWAY.

WE produce herewith a cut showing the new steel express cars recently delivered to the Norfolk and Western Railway. These cars are seventy feet in length and weigh complete 122,500 lbs. The roof is of the clear story type, being supported by twenty pressed steel upper deck and 82 pressed steel lower deck car lines. Practically the entire car is composed of steel, except the floors, and window-sash, which are wood, and the headlining, which is constructed of fire-resisting agasote. The insulation, lighting system, arrangement of lights, mail fixtures, etc., are all in accordance with the railway mail service requirements.



EXTERIOR OF 70 FT. STEEL POSTAL CAR OF THE NORFOLK AND WESTERN RAILWAY.

SEVENTY-TON HOPPER CARS FOR THE BIRMINGHAM-SOUTHERN

THE BIRMINGHAM SOUTHERN has recently received eighty hopper cars of 70 tons capacity, built by the Pressed Steel Car Company of Pittsburgh. It will be seen from the illustration that the cars are fitted with coke racks extending entirely around the sides and end. The weight of the car is 58,600 lbs., 38,700 being in the body and 19,900 lbs. in the

J. W. TAYLOR. Secretary M. M. & M. C. B. Associations.

ANGUS SINCLAIR. Treasurer, M. M. Association.

D. F. CRAWFORD. President, M. M. Association.

The newly elected officers of the Master Car Builders' and Master Mechanics' Associations.

The Convention of the Master Mechanics' Association.

THE American Railway Master Mechanics' Association held its 46th Annual Convention at Atlantic City on June 11th-13th. The convention, in view of the excellence of the reports considered and the discussion thereof, is one of the most important which has been held by this remarkable organization.

President Crawford, in his opening address, touched upon many of the matters which would be considered. He emphasized the growing importance of such organizations as this in advancing the development of transportation and educating the public to a proper understanding of railway problems, and in furnishing valuable information for bankers and others indirectly concerned with railway companies.

He quoted with approval the statement which had been made that the members of the Maintenance of Way Association, the Master Mechanics and the Master Car Builders' Associations are in direct control of sixty per cent of the operating expenses of the railroads, and that is was possible, through these organizations, by increasing the degree of standardization of equipment, to bring about greater economies in original cost of construction and in the cost of maintenance. He also suggested that these organizations should make a place in their work for the questions of labor which have become such an important part of the cost of these branches of the service.

He further expressed the opinion that perhaps too much attention had in the past been given to purely technical questions—concerning, for example, such matters as locomotive construction—without giving sufficient consideration to the locomotive as an instrument of transportation. He stated that there should be a closer study of the adaptability of the machine to specific work, obtaining the maximum output with the minimum expense, and other questions which are equally important. He commended the interest which the universities and scientific bodies were taking in careful studies and tests of locomotives and other railway equipment, and ex-

Digitized by Google

pressed the hope that this good work would go on. He also expressed keen appreciation of the importance of the studies concerning fuel economy, smoke prevention, train resistance and other similar investigations which have been undertaken.

Revision of Standards.

THE Committee on Revision of Standards presented a number of detailed recommendations concerning the revision of the specifications covering screw threads, gauges for cast-iron wheels, axles for locomotive tenders, allowance of engine mileage, and general questions concerning the use of air-brake and train air signals.

The Committee recommended that for the purpose of developing and shaping standards to a suitable form for universal adoption by the members, the Association should have and use "Recommended Practice," and that no standard should be adopted until it had been a "recommended practice" for at least one year, and that a standard should require such a substantial approval of the full active membership and the full railroad representative membership on the basis of one additional vote for 100 locomotives represented as will insure its being generally used. The Committee further recommended that whenever it is deemed advisable to alter any present, or prepare new specifications for material in which other recognized societies are interested, that the committee in charge of the work should be instructed to request the cooperation of those societies in preparing these specifications.

Mechanical Stokers.

THE Standing Committee on Mechanical Stokers submitted a valuable report reviewing the developments in this important field in the past year and the present status of this device in railway operation. After reviewing briefly the various types of stokers which are now used by the several railroads, the committee gives the results of its investigations as to the cost of stoker and brick arch repairs per 1,000 miles, which it finds averages $5.34. The committee was unable to find accurate data showing relative fuel consumption in hand firing and with the use of the stoker. The St. Louis & San Francisco Railroad's reports indicate higher economy with hand-firing locomotives, but the Committee is of the opinion that the tests were not such as to warrant any definite conclusion, as the various companies are sharply at variance concerning the matter. The mechanical stoker is apparently most effective with the smaller size of fuel—in fact, with some types, slack or crushed coal is necessary. With improved combustion, coals of a lower heat value can be utilized, adding still further to the economy of the stoker. It was also observed that when starting out steam can be gotten up more quickly with the stoker than with hand-firing.

The report presents the conclusions of the various railroad systems using this device, concerning the amount of tonnage which can be handled by mechanical versus hand-firing. After reviewing the reports, the committee concludes that this question resolves itself into one of physical characteristics, size of engines, character of fuel, and the skill of the firemen.

The ability to keep the fire door closed is a great advantage in favor of the stoker, lengthening the life of the fire box, flue sheets, seams and tubes. The stoker also has an advantage at terminals or ash pits because the thinner fire can be knocked out or cleaned in much less time. Against these advantages are the increased cost of maintenance of the stoker by reason of the increased amount of machinery and working parts.

In the discussion which followed the presentation of this report, Mr. W. C. Henry, of the Pennsylvania, stated that tests made by his system had shown increased tractive power due to the additional amount of coal delivered at the fire-box by the stoker over that which the fireman could handle. Mr. M. D. Franey, of the Lake Shore, stated that his experience convinced him that the stoker could do a little more work than the individual fireman and could give as nearly 100 per cent service as any other piece of mechanism attached to the locomotive. Mr. M. A. Kinney, of the Hocking Valley, stated that his company had been successful with the stokers in every case. Mr. T. M. Cooke, of the Pennsylvania, stated that engineers and firemen were generally skeptical towards the stoker when it was first introduced, but when the men became better acquainted with the device, this coolness disappeared.

Specifications for Cast Steel Locomotive Frames.

THE committee having charge of this subject presented the following recommendations for standard specifications for cast steel frames:

1. Castings must be true to pattern and free from flaws, shrinkage cracks, excessive scale or porosity. When patterns are furnished by a railroad company the manufacturer must make sure that the allowances for shrinkage in the patterns agrees with his own practice, and castings will be rejected, even when made from railroad company's patterns, which do not conform closely to required dimensions. Frames must be made perfectly straight and in true alignment, both vertically and horizontally. Frames will not be accepted which weigh less than 97 per cent of the weight specified, and material in excess of six per cent above the specified weight will not be paid for. The specified weight must allow a proper amount for finish, as may be agreed on.

2. All castings must be thoroughly and properly annealed, and test pieces must be annealed with the castings before they are detached.

3. Test pieces shall be one inch square, and, when possible, ten inches long, and must be left attached to each frame. At least two test pieces, one near each end of the frame, shall be provided. The test pieces shall be partly sawed off from the body of the casting so that they can be easily broken off, but shall not be entirely detached by the manufacturers. Both the main casting and test pieces shall be stamped with heat numbers. The finished test pieces for tensile strength test shall be ½-inch in diameter and two inches between shoulder fillets.

4. The material desired has a tensile strength of at least 70,000 pounds per square inch; elongation, twenty per cent in two inches and an elastic limit of 50 per cent of the tensile strength.

5. Cast-steel frames will be rejected which show less than the following requirements:

Digitized by Google

Tensile strength, minimum	65,000 lbs. per sq. in.
Elastic limit, minimum	30,000 lbs. per sq. in.

Elongation in two inches shall not be less than a percentage represented by 1,200,000 divided by the tensile strength.

Reduction of area, minimum	30 per cent
Phosphorus, maximum	.05 per cent
Sulphur, maximum	.05 per cent

When high carbon steel frames are specified, the carbon content must be not less than .37 per cent and the reduction of area not less than 25 per cent; other requirements as above.

The Committee did not deem it advisable to submit a standard specification for vanadium steel frames at this time. On motion the Convention decided to refer the report to the Association for a letter ballot vote.

Maintenance of Electric Equipment.

FOLLOWING the report on Cast Steel Locomotive Frames, an individual paper by Mr. C. H. Quereau, on Maintenance of Electric Equipment was presented and discussed. After reviewing the elementary principles underlying electricity in so far as they are applicable to locomotives, the author declared that there was no greater danger in the use of electric locomotives than in steam engines, provided the same degree of care was exercised in both cases; that no radical re-arrangement of plan and equipment of machine shops is necessary to handle locomotives, and that it is not difficult to train machinists to repair the newer type of engine. In concluding he stated that "there can be no particular mystery or unusual danger in maintaining electric locomotives when the records for the year 1912, after five years' service, show a cost of less than four cents per mile and an average of 48,271 miles per train detention due to electrical apparatus, with a banner record of 249,423 miles (equivalent to ten times around the world), without a train detention due to the electrical equipment."

Mr. C. P. Keiser, of the Pennsylvania Terminal Division, stated that his experience had demonstrated that men trained in the maintenance of steam locomotives could, without trouble, look after the upkeep of electrical equipment, and that the enginemen who operate the electric locomotives are able, after six months, to make ordinary road repairs without difficulty. This view was corroborated by Mr. S. A. Bickford, of the New York Central, and Mr. G. H. Wildin, of the New Haven.

Main and Side Rods.

THE Committee on Main and Side Rods submitted a report on this subject two years ago. It was discussed at the last meeting and held over for a year for consideration, coming up at this time for adoption or rejection as a possible standard. The Committee, in the interim, received a number of suggestions looking towards changes, and reported that "these suggestions have been considered, but were not deemed of a nature to require changing or adding to the previous report." Taking them in their order, the Committee reports as follows:

"We are not yet justified in giving a limit of stress for heat-treated or alloy steels, as too little is known concerning such material in actual locomotive service.

"The design of pins is necessarily handicapped by the available space, therefore the designer is restricted, and must obtain best results regardless of preferred bearing area and desired ratio of length to diameter of pin. Furthermore, the design of pins is not a part of the problem submitted to us.

A general rule for type of offset rods described can not be formulated without danger of having it misapplied. The rule as given may err slightly on the safe side, but can not be misapplied. It is therefore preferable to make no change.

"Attention is called to a correction that should be made in the original report:

"In Volume XLIV, 1911, page 137, at bottom, a change should be made, as follows:

"The minimum area at points indicated by letter 'b.'

"For main rods and main pin bearing of side rods.

"A equals $\frac{Px}{30000b}$

"For side rods, except main pin bearing, A equals $\frac{Px}{60000b}$

"The report, including the correction just noted, was submitted for adoption as standard practice."

The Association adopted the report as Recommended Practice.

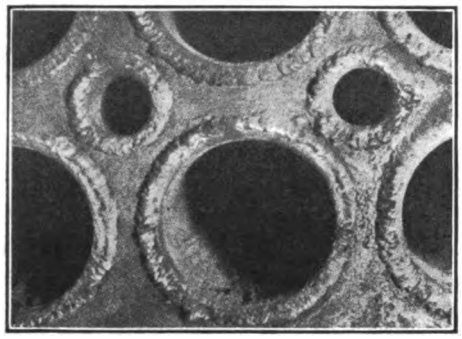
Maintenance of Locomotive Boilers.

THE Committee on Design, Construction and Inspection of Locomotive Boilers stated that they had no report to make on design and construction other than that presented to the members at the last convention. The report submitted covered only the question of maintenance of locomotive boilers. The Committee reported in detail the experience of various companies with both oxyacetylene and electric welding. Satisfactory results were being secured with both methods, although difficulties were experienced by various companies with both processes. The reports received from different roads indicate that considerable difficulty was experienced in welding flues with the oxy-acetylene process, while the roads using the electric process report very satisfactory results, especially by one of the roads that tried out both methods and found that the electric process gave such good results that it has adopted this for standard practice, and has at least 200 engines now running with flues welded in. The flues have seen considerable service, and when engines were brought into shop for intermediate repairs it was not necessary to remove the flues, which had been their practice theretofore. Therefore, your committee recommends electric process for welding flues. The committee also recommends that flues be set with coppers, prossered and beaded in regular manner before welding, until it is clearly demonstrated that other methods are equally as good or better.

Figures collected by the committee indicate that the cost of welding with the electric process is cheaper than with the oxy-acetylene process, that the electric welded flues give better service and that engine failures are largely avoided and

Digitized by Google

engines can be kept in service a greater length of time. It is stated that flues so welded can be run the three-year limit without removing and that roads using electricity finding it unnecessary to smooth off the felds. We reproduce herewith a cut showing an enlarged view of the flues when welded by electricity.



ENLARGED VIEW OF LOCOMOTIVE FLUES WELDED BY ELECTRICITY.

With reference to the welding of patches, the Committee reports that successful work had been done with both methods, although difficulties had been encountered by representative companies with both. The Committee feels "that there is a field in which each of the two welders, that is, electric and oxy-acetylene, excels the other. For welding seams, cutting out and removing old sheets, the oxy-acetylene excels. For welding flues, shore cracks and welding metal, where expansion must be taken care of, the electric welder excels. At engine houses the committee would recommend that electric welders be installed, and at shops, both electric welder and oxy-acetylene process be used, as oxy-acetylene process can be kept busy cutting out and applying new sheets.

"It is the consensus of opinion of the roads reporting that boilers should be washed with hot water. This method avoids sudden change in temperature and by this process the staybolts firebox sheets and boiler being washed clean in a shorter time. Most railroads now install hot water plants when building new roundhouses."

With reference to the question of flexible staybolts, the committee referred to the report made at the last convention and stated in addition that "the application of staybolts with some form of slack, is believed to be desirable as it relieves the firebox of excessive internal stresses which would be brought into play if the bolts are turned up tight."

Concerning the question of brick arches, the Committee reports that to secure the greatest efficiency the brick arch must be properly maintained and not often disturbed.

"The general practice seems to be to remove the center row of bricks when it is found necessary to bore or work on flues. Only enough brick should be taken out to enable the operator to get at the tubes. They must be removed as carefully as possible to avoid breakage. Some roads have a special brick-arch man, day and night, at the large terminals to make repairs to arches and to see that they are kept in good condition. Brick arch should be blown off with air by a pipe put in through the firebox door with a tee on the end which will blow the dirt, or a portion of it, to the corners where there is an opening which allows it to fall out on the grates."

Steel Tires.

THE Committee on Steel Tires reported no change in the specifications presented at the previous convention except the suggested addition of a new sub-clause: "(d) The elasticity shall be at least 50 per cent of the tensile strength." The Committee recommended the appointment of a standing committee on Steel Tires. The report was again presented for consideration. The Association by vote referred the recommendations to letter ballot for adoption as recommended practice, while the recommendation for making the committee a standing committee was referred to the Executive Committee without discussion.

Description of the University of Illinois' New Locomotive Testing Plant.

PROFESSOR S. C. SCHMIDT presented to the Association in an individual paper, a detailed description of the new locomotive testing plant at the University of Illinois. The equipment and characteristics of this plant were described in the May issue of the "Railway World," and it is not believed that a review of Professor Schmidt's paper is necessary in view of this fact.

Minimum Requirements for Locomotive Headlights.

THE Committee having charge of this subject reported that it had kept in touch with the various tests which had been made on headlights during the past year but was not in a position at that time to make anything other than a progress report. The committee was of the opinion that it is impossible to designate the minimum size of reflector and candle power of the source of light without going into the distribution of the light with the headlight, as a whole, and that this could not be done at the present time. Tests which have been made in the past year confirm the conclusion that high power electric headlights are a source of danger when used by railroads of several tracks and automatic signals. It is expected that the Committee will make a final report by January 31, 1914.

Superheater Locomotives.

SINCE the last report of this Committee, there has been an increase in the number of locomotives in the United States and Canada using superheated steam of more than 100 per cent, the total number now being 8,822. The reports received from the companies using this type of locomotive are uniformly satisfactory; the troubles that were feared with packing and valves have not developed or, where apparent, have been overcome. The Committee has not been able to determine any definite figure relative to the comparative maintenance cost of superheated and saturated steam locomotives, but the general opinion seems to be that if there is any increase in the cost of maintenance, it is

Digitized by Google

not sufficient to be a serious factor. A large portion of the report of the Committee was given up to a compilation of the results of a series of tests of two Atlantic type locomotives, two Pacific type and two consolidation locomotives, one of each type equipped with a Schmidt superheater and the other using saturated steam, which was made by the Pennsylvania during the past year at its Altoona shops. The tests furnish the Committee with additional information on flue lengths.

"The short tubes show an advantage in activity of combustion and also in rapidity of evaporation, with an attending lower efficiency of the boiler, and we conclude that:

"(a) The most desirable length of tube depends upon how much the designer is willing to sacrifice in boiler efficiency to obtain rapid evaporation with some loss of heat.

"(b) There is a rapid decrease of temperature in the tubes for a distance of three or four feet from the fire-box end, after which the temperature drop is more gradual until, with this short tube, the curve of tube temperature becomes flat toward the smokebox end, and therefore the heat transfer at the firebox end of this tube is much higher than at the smokebox end.

"(c) The temperature of the superheater flue is in all cases from 100 to 200 degrees higher than the temperature in the boiler tube. This is probably due to the larger volume of gases passing a hot tube surface, namely, the superheater units.

"(d) Observations made on other locomotives indicate that there is little if any difference in temperature of flues as far as their location in the sheet is concerned.

"(e) From the boiler efficiency obtained with this locomotive, the form of the curve of temperature drop in the tubes, and the high smokebox temperature, slightly longer tubes seem desirable."

From the results secured by the tests, the Committee believes that "any locomotive in being converted from saturated to superheated steam should, with the application of the superheater, have enlarged cylinders, the results indicating that for the purpose of obtaining maximum economy the extent of the cylinder enlargement should be such that the maximum indicated horse power may be developed at a cut-off not exceeding 30 per cent."

In addition to the report of the Committee on Superheater Locomotives, the Convention listened to and discussed an individual paper on tests of superheater locomotives by Dean C. H. Benjamin, of Purdue University. Professor Benjamin used in large part the tests made by Dean W. F. M. Goss, of the University of Illinois, reported to the Association in 1909, as the basis of his comparisons. His conclusions agree generally with those of the Committee investigating the same subject.

Three Cylinder Locomotives.

MR. J. SNOWDEN BELL presented an individual paper on three cylinder locomotives in which he reviewed the history of this device, pointing out the advantages and disadvantages of each type heretofore designed. Commenting upon the economic advantages, through the use of this type, Mr. Bell states that "the most important advantage claimed for the three-cylinder locomotive is the attainment of substantially uniform turning moment, from which there results more rapid acceleration in starting and greatly increased smoothness and steadiness in running; reduced destructive action on rails and bridges; and the exertion of greater tractive power and utilization of a lower factor of adhesion than a two-cylinder engine. The system further affords facilities for providing increased cylinder power, equally divided in a balanced application, at a minimum cost of construction and maintenance, and is adapted for operation upon the simple, compound, or triple-expansion principle. The necessity of using a crank axle and connections, for the attainment of these results, of course, involves the objection of increased complication and cost, but with the materials and methods now available in the manufacture of crank axles, the objections to this form of driving axle, as compared with a straight axle, are reduced to a minimum, and, as compared with four-cylinder locomotives, a considerable number of which have been constructed, both in Europe and in the United States, the advantage, in point of simplicity and economy, is obviously materially in favor of the three-cylinder locomotive. This is also the case as to structural considerations, as on account of the limited space available between frames in four-cylinder locomotives, the crank cheeks must necessarily be made comparatively narrow, consequently giving insufficient length of fits for the axle and crank pin, in the built-up type, and being an element of weakness in the solid forged type. This objection does not obtain in the case of the single pair of crank cheeks of a three-cylinder locomotive, there being sufficient space to provide crank cheeks of ample width to prevent looseness in the fits, and by reason of its comparatively simple form, the axle can be readily forged in an ordinary railroad shop."

In connection with this paper, Mr. Bell presented a number of figures showing the comparative performance and the main physical characteristics of the three-cylinder locomotives recently constructed by the Reading. The results of the tests of these engines were reported by the "Railway World" in the January issue.

Special Alloys and Heat-Treated Steel in Locomotive Construction.

THE Committee having charge of this subject sent out a circular of inquiry outlining a series of seventeen questions. From the information received—it was believed to be sufficiently extensive to be typical—the Committee decided to make a progress report. From the replies, the Committee concludes that the greatest use of alloy steel is in locomotive frames, main and parallel rods, piston rods, axles and crank pins, although some roads are using alloy steel springs. In all these places, vanadium and chrome-vanadium steel is being extensively used.

The Committee concludes that "in a general way the use of heat-treated carbon and alloy steels has resulted in satisfactory service, increased mileage having been obtained from the materials with apparently fewer failures, although in the majority of the cases the material

Digitized by Google

has not been in service long enough to make a fair reply.

"Seven roads do not require any heat-treated carbon or alloy steel axles and crank pins to be drilled, whereas four roads are at this time requiring drilling for the proper treatment. Present tendency seems to be toward requiring the drilling of shafts of large diameters.

Most of the members have not found it desirable to use alloy steels and heat-treated carbon steels in designs where excessive vibration or shock is not expected, five roads stating that this is their present practice. One member is using this material for springs, one for side rods and one for all machinery part for high-speed passenger locomotives.

"Heat-treated carbon steel can be obtained at a slight advance in price, whereas alloy steel may be purchased at an increased cost, approximately double that of the plain carbon steel, heat-treated."

Specification for Materials Used in Locomotive Construction.

THE Committee in charge of this subject, after conferring with the special committee of the American Society for Testing Materials, submitted a form of specification covering lap-welded steel boiler tubes. These specifications do not differ greatly from those of the above Society, the chief difference being an amplification by including arched tubes and large superheater tubes of 2½ in. in diameter and less. The specifications as submitted by the Committee were referred to letter ballot for adoption as Recommended Practice.

Smoke Prevention.

SEVERAL members of the Committee on Smoke Prevention were also members of a special committee appointed by the General Managers' Association of Chicago, to determine the advantages of steam jets in locomotive fireboxes as an aid to smoke prevention. Upon recommendation of these members, the report of the General Managers' Committee was transmitted to the Committee of the Master Mechanics' Association for inclusion in its report and publication in its proceedings.

The report in question deals most extensively with each of the various methods of preventing smoke both upon the road and in the roundhouse, giving exhaustive data concerning the comparative results of each method. After a careful review of all of the evidence collected, the committee reached the following conclusions:

"The steam-jet combustion tube has a decided value in reducing smoke under the widely varied conditions of these tests. The air injected by the tube was found to be the greatest factor in reducing smoke, although a small amount of steam seems essential in smoke reduction. When using steam-jets, injecting air into the firebox, it was apparent that a greater reduction in smoke was accomplished by their use with improper firing as compared with careful firing. The firebox temperature was found to be higher when the arch was in service as compared with the plain firebox, although the data do not consistently show that a reduction in smoke follows increased firebox temperature.

"The steam-jet tubes seem to give the best results in preventing smoke when located so that the injected air and steam meet the flame as high as possible above the fuel bed. If the arch is used the best results seem to be obtained when the air passes underneath the arch as high as possible above the fuel bed. The arch gives better results in smoke prevention if it fits tight against the flue sheet. A tight arch, however, has the practical disadvantage of collecting deposits of sparks and eventually closing the lower flues.

"An efficient design of smoke-box blower is an important factor in smoke abatement. Air openings in the fire door are of slight assistance in smoke abatement, as they are capable of supplying only about ten per cent of the air necessary above the fire and a very small percentage of the total air for complete combustion.

"Best results were obtained when from four to six pounds of air per pound of coal fired was injected by the steam tubes from a location in the back head above the fire door. It was found on these tests that the total amount of air, including that which was introduced above the fire, should not be less than 13 pounds per pound of coal for good smoke prevention.

"The data seem to indicate that the best results can be obtained when the least amount of steam is injected with the greatest amount of air.

"The use of the steam-jet tubes results in considerable economy, and in the efficiency tests an increase in evaporation was obtained.

"The steam-jet tubes apparently reduce the weight of sparks discharged from the stack, but the data were not of a character to firmly establish this point.

"There is a necessity for a quick-acting, easily operated valve capable of giving reasonable graduations in pressure.

"It was found during the tests that the steam nozzles were being worn by the steam and this accounts for the inability of the steam lines to supply as great a pressure to the jets as desired in some of the later tests. The nozzles were made of brass. The indications are that they should be made of steel and, if necessary, hardened. The 3-16-in. diameter steam nozzle seems to be the desirable one to use in a two-inch tube.

"There is noise incident to the use of the steam-jet tubes in the most efficient arrangement, and if the steam-jet tubes are located in the cab they should be covered with a ⅜-inch cast-iron box provided with cast-iron air intake from a point outside the cab, the air intake being provided with a muffler."

Engine and Tender Wheels.

THE Committee having charge of this subject, after a careful study, submitted a report including eighteen recommendations regarding recommended standards, and covering, among others, the following topics: specifications for solid wrought carbon steel wheels for locomotive and tender service; chemical properties and tests; tolerances; branding; finish, and inspection.

The report of the Committee was referred to letter ballot for adoption of the various recommendations made by the Committee as Recommended Practice.

MASTER CAR BUILDERS' ASSOCIATION.

THE Master Car Builders' Association held its 47th Annual Convention at Atlantic City, on June 16th-18th inclusive. The Convention was one of the best attended and most interesting gatherings which this body has held, and the reports submitted by the standing and special committees were of an unusually high order.

President C. E. Fuller, of the Union Pacific, in his opening address, asked whether the Convention had given proper attention to the question of reducing the cost of maintenance and operation of equipment. He suggested the thought that perhaps too much attention had been given to car construction and to the formulation of rules looking towards a reduction of delays in interchange of cars. He hoped that the members, in dealing with the various reports brought before them, would be careful to avoid doing anything which would mean an increase in maintenance and operating expenses which could not be satisfactorily defended before the bar of public opinion on the ground of safety and economic progress.

He recommended that the Committee on Car Construction should be continued and that it should undertake an investigation of the advisability and practicability of constructing cars of heavier capacity—say of 70 tons—so as to increase the tonnage and enable them to reap the benefits of reduced rates and heavier tonnage, without increasing the length of the trains.

The method of insulation of steel passenger cars, in Mr. Fuller's opinion, merited the earnest study of the Association, as did also the question of adopting a standard M. C. B. coupler. Mr. Fuller commented upon the vexing question of the abuse of repair cards or the making of "pencil repairs," which is alleged to be done by certain companies, and hoped that it would be possible for the Association to work out a solution of this trouble.

Revision of Standards and Recommended Practice.

THE first committee report to be considered was that of the Committee on Revision of Standards and Recommended Practice. The report of this Committee, as usual, dealt with various proposed changes in the standards heretofore adopted by the Association, practically all of which were of a minor character, intended either to clarify obscure rules or to cover contingencies not included within the original rules.

The Committee adversely reported upon the suggestion that the condemning limits be increased from 3¼ in. x 7 in. for journals to 5½ in. x 10 in. journals, in order to provide a sufficient margin of safety. The Committee approved of the recommendation of advancing axles with 6 x 11 in. journal, designed to carry 50,000 lbs., to standard; the Committee also recommended that the action of the 1912 Convention as regards a standard for signal lamp sockets be made the standard of the Association; that the recommended practice of marking on freight equipment cars be made standard, as well as the recommended practice as regards springs and spring caps for freight car trucks. The Committee recommended practice as regards classification of cars, in accordance with the request of Mr. G. P. Conard, secretary of the Association of Transportation and Car Accounting Officers for the assignment of designating symbols for equipment. The request covered the following classes of equipment:

"BM"—Milk Car.—Exclusively for the transportation of milk, being a car for this purpose and fully equipped for handling in passenger trains.

"ES"—Electric Passenger Car.—For long hauls or suburban service; multiple unit, and fitted with automatic couplings and air brakes. Operating power, storage battery.

"GB"—Gondola Car.—A car with solid bottom, sides and ends, and open on top; suitable for mill trade.

Note to Follow Class "H."

If any of these hopper cars are provided with roof or cover for protection of contents, the letter "R" should be affixed to the regular symbol to designate its special class of service.

"MBE"—Combination, Baggage, Mail and Express Car.—A car having three compartments, each entirely separate from the other for handling its individual class of business.

"MPB"—Combination, Baggage, Mail and Express Car.—A car having an individual compartment, each entirely separate, one suitable for mail, one suitable for baggage, and one suitable for passengers.

"XI"—Box Car, Insulated.—A box car having walls, floor and roof insulated, not equipped with ice bunkers or baskets. This car ordinarily used for transporting vegetables, freight, etc.

"MWX"—Boarding Outfit Cars.—This includes cars used for boarding, sleeping, or cooking purposes in construction and similar work.

The Committee concurs and assigns symbols as indicated.

A member suggests assigning designating symbols to the following class of equipment:

Symbol.	Kind of Car.	Description.
"MWE"	Ballast Spreader and Trimmer.	A car with blades or wings for spreading or trimming ballast.
"MWJ"	Ballast Unloader.	A car equipped with machinery for pulling a plow through cars loaded with ballast.
"MWP"	Pile Driver.	A car equipped with machinery for pile-driving.
"MWK"	Snow Removing Cars.	Cars equipped with any special device for removing snow from between or along side of rails.
"MWM"	Store Supply Car.	A car equipped for handling material to be distributed for railway use.

Following the heading of "General Service Freight Equipment Cars," not to be added as follows:

Digitized by Google

Any of the following classes of equipment having special heating appliances for the protection of commodity against freezing, to be covered by affixing the letter "H" to the designating symbol.

"SH"	Horse Car.	A car specially fitted for the transportation of horses in freight service.

The Committee concurs in the recommendation, so far as designating symbols are assigned.

The Committee further recommended that the proceedings of the Committee on Standards and Practice be separated from the proceedings of the Association as at present published, and should be published as a separate volume.

Train Brake and Signal Equipment.

THE Committee on Train Brake and Signal Equipment recommended that hereafter all freight cars weighing between 37,000 and 58,000 pounds be equipped with ten-inch brake cylinders, and that the braking power for freight equipment should be made sixty per cent of the light weight car, based on 50 pounds per square inch cylinder pressure. With the recommended size of brake cylinder, this would mean a total leverage of nine to one as a maximum.

Upon the basis of the responses to inquiries addressed to air-brake companies, the Committee concludes that K-1 triple valves are favored for eight-inch and K-2 for ten-inch equipment. The advantage to be derived from the adoption of a standard triple valve for all freight equipment and the elimination from service of several different types are so obvious that your committee does not hesitate to recommend that the K-1 and K-2 triples be made the standard for freight cars.

Proceeding to an examination of the effect of the relative increased weight and the length of passenger trains upon the problem of securing uniform application of air-brakes and to avoid sticking brakes, the Committee concludes that "the internal diameter of the brake pipe plays a very important part in the satisfactory operation of the brake, and therefore your committee gave this matter careful consideration, having before it a report of the results of tests made by the Westinghouse Air Brake Company to determine the effect on brake operation of various internal diameters of brake pipe. This report clearly shows that no pipe having an internal diameter less than that of one-inch standard weight pipe should be used on passenger cars. It also shows that the larger internal diameter of the 1¼-inch extra heavy pipe had some important advantages over the internal diameter of the one-inch standard weight pipe, especially with respect to satisfactory release of brakes at the rear.

"Your committee therefore recommends that no pipe having an internal diameter less than that of one-inch standard weight be used on passenger cars, and that for all new equipment 1¼-inch extra heavy pipe be used.

"The action of acids and salt water drippings from coal and refrigerator cars falling onto the brake pipe and its fittings causes them to deteriorate rapidly, and it has been suggested to this committee that the brake pipe on such cars should be galvanized to protect them.

"While the committee has no definite data on the amount of damage caused by the action of acids on the exterior of the pipe, yet it is known to be large, and it has been discussed at previous conventions. To galvanize the pipe does not add materially to its cost, while it serves to protect it from corrosion. It would, therefore, be a paying proposition to galvanize all brake pipe and fittings, and the practice of doing this is recommended."

Brake Shoe and Brake Equipment.

THE Committee having charge of this subject repeated the recommendation of last year as regards the necessity of additional tests to determine the effect of high brake shoe pressures upon the standards heretofore adopted by the Association, covering in particular, tests at a speed of 65 miles per hour and at pressures of 9,000, 12,000, 14,000, 16,000 and 18,000 pounds. With reference to what changes, if any, are necessary in brake beam equipment, the committee recommends the adoption as Recommended Practice of a type of brake beam shown in detail in diagrams accompanying the report. It also recommended:

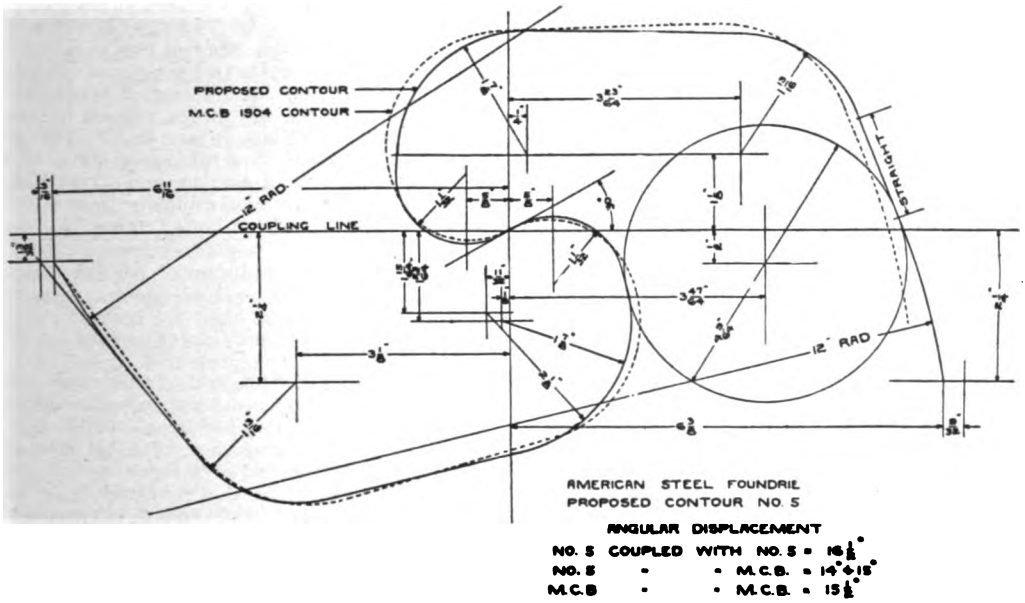
"That the question of preparing a specification for a brake beam for passenger train cars be submitted to the membership of the Association for letter ballot, and that a spacing of 60 inches be adopted as a standard for brake beam heads, with a maximum allowable spacing of 60⅛ inches and a minimum of 59⅞ inches, this spacing to be measured by gauging the inside of the brake head key lugs."

Coupler and Draft Equipment.

THE report of this Committee contained the results of the tests outlined in the report of last year and which were to be carried out during the year under the direct supervision of Mr. C. D. Young, engineer of tests and the chairman of the committee, in conjunction with the Pennsylvania Railroad. The results of all the individual tests, covering a wide range of couplers, were plotted graphically, the graphs being included as a part of the report. The tests covered both laboratory and road trials and were of the most thorough character, and the data secured will be of great service to the railway industry in perfecting the coupler.

At a joint meeting held in February, 1913, of the representatives of coupler manufacturers and of the Coupler Committee, it was decided that the straight line contour submitted by the National Malleable Castings Company is based on the correct principles, being preferable to the M. C. B. contour, and "that a contour line should be developed with the straight face as a basis, incorporating in the same the features of the American Steel Foundries No. 5 contour line and the contour submitted by Mr. Richards of the Gould Coupler Company. The National Malleable Castings Company agreed to do this and submit the new line to the Chairman for approval. This proposed contour was drawn up, approved and tried out on the special coupling and angling machine located at the Cleveland works of the National Malleable Castings Company during the week of March 17, 1913, under the direction of Coupler Committee representatives, Messrs. Kleine, Justus and Boring."

Digitized by Google



Proposed Straight Line Contour; American Steel Foundries No. 5.

Various designs of straight line contours were accordingly worked out and subjected to an exhaustive series of tests in competition with the M. C. B. contour. "In summing up the trials, each representative present voiced his views and it was decided that the proposed straight line contour and a contour not reducing incline of coupler face but embodying enlargement in diameter of knuckle hub and other slight changes over present M. C. B. contour as represented by the American Steel Foundries No. 5 contour, should be given a large and thorough trial in service, with the feeling that if the proposed straight line contour couplers gave no general trouble in coupling it should be adopted, otherwise we should hold to a contour having incline of coupler face not reduced over present M. C. B. contour and make the best of it in buffing, even though it was not designed for sustaining the enormous shocks imposed in buffing in service."

The dimensions and main characteristics of the proposed straight line contour coupler, following the standard represented by the American Steel Foundries No. 5 contour, are shown in the accompanying illustration. "The general investigation of coupler conditions and the result of tests—static, dynamic and road—conducted by your committee, as well as the great number of couplers and parts requiring renewal, demonstrates beyond a doubt that the present coupler is inadequate in strength to meet the increased demands placed upon it, consequently considerably curtailing its life, which is aside from the desirability of reducing the number of designs to a minimum. The investigations and developments made during the past year have satisfied your committee that this required increase in strength can be accomplished, but the weight of the coupler will necessarily have to be increased from 30 to 40 per cent."

After your committee has selected the couplers to be placed in service to be tried out experimentally, and the service tests show that no serious defects exist, the members will be notified which couplers can be recommended for trial purposes, so that a general trial, in limited quantities, can be made by the railroads to ascertain their suitability for general service; this trial to be preferably conducted on locomotives. Until this announcement is made, your committee must earnestly request the railroad representatives not to apply any new or experimental types of couplers on freight cars which involve new designs unless the parts are interchangeable with present couplers in service, as by so doing it will forestall the work of the committee, and, for various reasons, possibly prevent the Association from arriving at a successful issue of the one-standard coupler.

The face test, as has been previously stated, is found unsatisfactory along the lines of obtaining uniform results, and while your committee has experimented with the "Hb" tests, it is not prepared at this time to propose it as a substitute for the face test, but recommends that the "guard-arm test" previously a Standard of the Association be again made Standard to replace the face test until some more suitable test can be devised.

Car Wheels.

THE Standing Committee on Car Wheels submitted at the last Convention a proposed specification covering the dimensions and tolerances for solid wrought steel wheels for freight and passenger service, which were subsequently adopted as recommended practice. These specifications did not include rules concerning the process of manufacture and with respect to the chemical and physical properties of the material, or analyses and tests of the finished product. The determination of these questions constituted the major portion of the work of the committee during the last year.

The specifications were revised to include all

Digitized by Google

additions and changes which experience and other investigations of the committee showed to be necessary. No physical tests of steel wheels are included in the report of the committee, that body being unable to determine a proper physical test for such purpose. The committee performed a number of experimental tests, but did not secure sufficient data to enable any intelligent decision.

Revision of the Rules of Interchange.

THE Committee having charge of this subject submitted in its report the reports heretofore published and distributed covering arbitration cases Nos. 881 to 917. The reports of the committee on these matters have been commented upon from time to time in the "Railway World." In addition the committee dwelt upon a large number of matters which were thought of sufficient importance to warrant a definite report.

With reference to the matter of rules of interchange, the committee reported that, at the suggestion of the Arbitration Committee, a committee from each of the railway clubs was appointed to consider jointly the proposed changes.

Heretofore there have been suggestions made by the different clubs which varied only slightly, while others were more radical. It was thought that if the club representatives were given some latitude in regard to modifying or changing the suggestions that the resultant changes proposed would be in better shape for consideration both by the Arbitration Committee and the Convention.

A meeting of this joint committee was held in Chicago on April 14th, at which meeting representatives from the New England, Central, Pittsburgh, Canadian, Western, St. Louis and Southern and Southwestern Railway Clubs were present. Their recommendations are shown under each rule.

At the request of several members of the Association, representing cars of private ownership, a hearing was given by your committee on May 6, 1913, at which representatives of the following companies were present:

Armour Car Lines.
Morris & Co. Refrigerator Line.
Swift Refrigerator Transportation Co.
Cold Blast Transportation Co.
Street's Western Stable Car Line.
Mather Stock Car Co.
Western Live Stock Express.
Missouri River Despatch.

These gentlemen suggested changes in Rules 33, 40, 55 and 95, which suggestions appear under the respective rules, for the following reasons.

In so far as Rules 33, 55 and 95 are concerned, as they now stand, they give individual car owners no protection whatever where material is lost on the lines of the railroad companies, regardless of its condition; neither do they protect them against material missing on account of being struck or torn off, the expense of which should be borne by the handling company. Practically all of the material lost from other causes is in good condition when lost, and can be used, and in a large percentage of cases would not have been lost had proper repairs been made to the part responsible for its loss at owner's expense.

As regards Rule 40, they protest against the elimination of the rule, and suggest a proposed change, stating that its elimination would leave no protection to the car owner against breakage due to rough handling or accident. The proposed change under this rule, they state, would afford car owners protection and at the same time enable the handling company to repair the cars without special authority from car owners.

In regard to the addition of ten per cent to car repair bills, effective November 1, 1912, they advise that the data at hand are not sufficient to show its outcome, but from the earnings and expenses of the cars represented, they feel that as the investment for cars affected was made under conditions which did not embody such percentages, that the ten per cent should not be added until further consideration is given to the revenue feature of the investment.

These suggestions and arguments have been carefully considered, and under each rule, as referred to above, the recommendations of your committee will be found.

Freight Car Repair Bill and Abuses of the Repair Card.

THE Committee appointed to consider this subject conferred with a committee from the Association of American Railway Accounting Officers, considering, among other matters, a letter from Mr. F. A. Delano, receiver of the Wabash, who made a number of suggestions concerning rules now existing and improvements which should be made. Upon the basis of the investigation and the conferences, the committee reported that:

A. Bills should not be rendered for amounts less than twenty-five cents (25 cents) in aggregate, but charges for items less than twenty-five cents (25 cents) may be held until they amount to that sum, provided said aggregate is rendered within sixty (60) days.

B. No bills should be returned for correction on account of incorrect car numbers, but shall be passed for payment at once and the alleged errors in car numbers brought to the attention of the company rendering same within sixty (60) days from date of receipt of bill.

The billing company shall furnish correct car reference, or shall issue within thirty (30) days counter charge authority, as per Form 1 attached.

C. No bills shall be returned for correction on account of other error or questionable charges unless the net amount involved exceeds ten per cent of the total amount of bill, but shall be passed for payment at once and the alleged error brought to the attention of the billing company within sixty (60) days from the date of receipt of bill. The billing road must furnish proper explanation or shall issue, within thirty (30) days, counter charge authority on Form 1.

D. Undercharges shall be similarly adjusted on regular authority of the company against which the bill has been rendered.

E. When bills are returned for correction, all defect cards and billing repair cards, except those in question, must be retained by the company against which the bill has been rendered.

Digitized by Google

FORM 1.

M. C. B. ASSOCIATION—COUNTERBILLING AUTHORITY.

(Name of Railroad)
Place.....191..
This will Authorize the.....
Railroad Company to counterbill the.....
.....Railroad Company.
..... Dollars
to offset overcharge in our bill No.....
Amount, $.....
$..... .....
Signature of person issuing.
This authority must be attached to bill.

The committee further reported that it believed that "the price of labor and material established by the M. C. B. Association is less than cost, if supervision, the use of facilities and tools and other shop expenses are taken into consideration. This has a tendency to cause some car owners to encourage the making of repairs to cars by the handling company. Therefore we suggest that the Master Car Builders' Association make such changes in the allowances for labor and material as will more nearly represent the actual cost of repairs.

"Relative to the first suggestion in Mr. Delano's letter, your committee agrees with this suggestion, and to enable the car owners to make a check of the car repair bills on basis of car days, recommends that M. C. B. Rule 93 be changed to read as follows:

"'Rule 93. Separate bills must be rendered for cars destroyed.'

"All charges for repairs made to cars account of owners' defects, defect cards and rebuttal authorities must be consolidated against any one company into one bill.

"Separate statements to be made:

"First. For owner's defects for each calendar month.

"Second. For all charges based on defect cards, including rebuttal charges.

"Note.—Totals only of these statements to be shown on the recapitulation."

Prices for Labor and Material.

AS the result of an extensive investigation made into the question of the fairness of prices as provided by the schedule of the Association for labor and material, the Committee having charge of this question reported what in effect is a complete new schedule of prices, in practically every case considerably higher than those heretofore provided. A feature of the recommendations was a change proposed in the depreciation rates, the new rates being in substance, one of seven per cent per annum upon the yearly depreciated value, in the case of wooden car bodies, one of six per cent per annum in the case of wooden cars with steel center sills and a depreciation rate of six per cent per annum in the case of all steel bodies, while in the case of tanks or tank cars for handling non-corrosive substances, a rate of four per cent per annum was proposed. The rate for tank cars handling corrosive substances was to be five per cent, the depreciation of trucks other than metal seven per cent, and of metal trucks five per cent per annum.

The report of the committee was accepted by the Convention with the exception that the recommendations as to depreciation were not approved, the rates to remain the same as last year.

Revision of Rules for Loading Material.

A LARGE number of revisions in the rules of loading special classes of freight were proposed by the Standing Committee on Revision of Rules for Loading Material. The purpose of the revision is to prevent accidents or damage to the freight in transit and to secure greater safety in operation. In all, revisions were recommended for forty-one rules.

Overhead Inspection of Box Cars.

ONE of the most interesting and valuable reports submitted to the Convention was that of the Standing Committee on Overhead Inspection of Box Cars. This committee reported, after a lengthy investigation, against the use of forms of inspection cards for handling each of the following classes of freight—"flour," "cement," "grain," "rough freight," "not fit for grain," "cement or plaster"—on the ground that it would lead to confusion and would prove unsatisfactory to the carriers. Instead, the committee recommended the use of one card in substantially the following form:

A. B. & C. Ry.
This car
No. ..... Initial.....
O. K. FOR SHIPMENT OF COMMODITIES.
Under.....Classification.
Inspected by .....
Date .....191.. Station .....
(Size of card, 6 by 8 inches.)

On back of cards, inspection instructions should be printed as follows:

INSPECT FOR

Classification "A."
Leaky roof.
Loose siding.
Loose roof boards.
Shifted roof sheets.
Broken door stops.
Leaky doors, tops and sides.
Broken end posts.
Broken or loose door posts.
Protruding nails in floor and lining.
Floors soiled by oil, grease or any material carrying odors likely to damage lading.

Classification "B."
Leaky roofs.
Loose siding.
Loose roof boards.
Shifted roof sheets.
Broken door stops.
Leaky doors, tops and sides.
Broken end posts.
Broken or loose door posts.
Holes in floor and around center plates and draft bolts.

Classification "C."
Leaky roofs.
Loose siding.
Loose roof boards.
Shifted roof sheets.
Broken door stops.
Leaky doors, tops and sides.
Broken end posts.
Broken or loose door posts.
Protruding nails in floor and lining.

Digitized by Google

Method of Inspection Before Loading.

(A) Inspection to be made at point of loading whenever practicable.

(B) At point of distribution from which car is forwarded to loading station, and again by Agent.

(C) Cars received and unloaded at station where no inspectors are located, should be inspected by the Agent.

Aside from the Master Car Builders' inspection of car, including roof, running boards, air brakes, safety appliances, and running gear, as well as the external inspection of sides, ends, doors, ventilators and windows, an internal inspection must be made of the roof and siding, with doors, ventilators and windows in closed position.

1. Search for light indicating openings and cracks which might produce leaks.

2. For loose, damaged and broken boards, loose knots, knot holes, bad joints, etc.

3. For all nails and bolts extending above surface of floor and lining and nails protruding through roofing.

4. Search for water stains indicating cracks and air spaces.

5. Search for cracks sufficient to admit storm water beating through opening, also for openings and bad joints around window and doors.

6. Examine for metal sheets out of position along edge of subcarlins or down from edge of ridge pole.

7. Search for small holes in metal roofs due to rust or small openings in roof from other causes.

8. Doors must open and close properly.

The floors should be clean, dry and free from defects sufficient to admit moisture, and any fouling by previous shipments, such as fertilizer, oils, and other freight which would damage more perishable commodities.

If the centerpin is uncovered, it might be necessary to cover it with a piece of board, depending entirely upon the character of freight to be loaded. It is necessary to inspect closely for defects in framing, which might result in the sheating becoming broken or damaged.

The committee expressed the belief that the railroad companies could, with profit to themselves, adopt a form of inspection such as it had outlined, and that it would prove practicable in use.

Car Trucks.

THE Committee on Car Trucks reported that it was now conducting, but had not completed, a series of tests concerning the various designs of cast steel truck sides, and that after the tests upon this matter, as well as those relative to cast steel truck bolsters, were concluded, it was likely that revisions would be suggested in the M. C. B. recommended practice. The committee further reported that it was making a series of tests of the M. C. B. arched bar side frames as well as a number of individual designs to determine their relative strength, and that this data will be valuable for comparison with that covering the cast steel side frames, when completed.

Progress was also reported in the investigation of the subject of springs, which will not be completed until Fall. It is expected that the conclusions will provide for five springs under each end of the bolster for trucks with 6 x 11 inch journals, and four springs under each end of the bolster for trucks with 5½ x 10 inch journals, each unit for the two types of trucks to be of the same design.

The committee requested that members communicate to it any data in their possession showing wherein the present standard center plate has proven unsatisfactory, as well as any recommendation which they may have as to improvements.

Train Lighting.

THE Committee on Train Lighting recommended a standard design of axle- dynamo suspension:

"Axle-dynamo suspensions must be designed so that with full diameter wheels and truck on straight, level track, any part of the dynamo or suspension must have a clearance not less than six inches above top of rail, and a clearance of at least 3½ inches between any part of the mechanism attached to the car body.

"In axle-dynamo suspension the metal carrying the weight of the dynamo must not be subjected to wear.

"In axle-dynamo suspensions, if side arms are used, the end to be secured to the truck frame must extend under transom and be bolted to the side frame near the transom, and if carried through or over end sill, must be held securely to end sill by a hooked bolt not less than ¾ inch in diameter.

"When possible, the belt should go over the end sill and under the brake beam with belt clearances of at least one inch."

In addition, recommended practice as regards standard design of battery boxes were recommended, and the committee also suggested recommended practice as to maintenance and repair of batteries.

Train Pipe and Connection for Steam Heat.

THE Committee having charge of this subject submitted proposed specifications to the Convention held in 1912. The Association decided to submit these specifications to a letter ballot. The result of the ballot was the rejection of the proposed specifications. The Committee thereupon continued to investigate the subject, making a number of tests and securing whatever additional information was available from manufacturers and others interested in the subject. As a result of this study and of the criticisms which the committee received from members relative to the previous specifications which had been rejected, the committee prepared a new set of specifications for steam heat hose and couplings, which was submitted to the Convention. The new specifications differ from those of the previous year largely as regards the matter of detail and the omission of specifications for both a medium sized coupler and what is known as the large coupler, the committee having come to the conclusion that the difference is so slight as to be unwarranted, and that therefore it would be best to recommend what is known as the medium-sized coupler for universal use.

Digitized by Google

Tank Cars.

SINCE 1912, the Tank Car Committee has approved, as meeting the requirements of the Master Car Builders' specifications for special tank cars, the design and specification for lagged tank car for the transportation of liquified chlorin gas, submitted by the Goldschmidt Detinning Company; the design and specification for the same type of car for the transportation of liquified petroleum gas, submitted by the Pennsylvania Tank Car Company, and the design of cast steel vent for sulphuric acid tank cars, submitted by the Crescent Tank Line.

The committee has still pending before it, as incompleted work, the design for the tank car for casing head gasoline, submitted by the German-American Car Company, and the question of using existing tank cars for the transportation of ammonia solutions.

"As regards the tests of tanks and safety valves now provided for by the Tank Car Specifications, your committee feels that some improvement should be made on the present practice, by requiring that a certified record of the tests shall be available in some one office. Heretofore the rule has been that the railroad on whose line a car is at home shall exercise supervision. The importance of these tests will be very great in the event of law suit following damage, and your committee believes that the office of the Chief Inspector of the Bureau of Explosives would be the proper place for the filing of these certificates. Considering the fact that the Interstate Commerce Commission requires that tank cars shall conform to the rules of the Master Car Builders' Association, it is highly probable that a ruling will be made by the commission, fixing the procedure to be followed in reporting the tests of both cars and valves.

"Nothing has transpired during the past year to call for any radical changes in the Tank Car Specifications. The changes which the committee recommends, which are detailed on the accompanying sheet, are principally with a view to removing ambiguities."

Specifications for Freight Car Truck Sides and Bolsters.

THE Committee having charge of this matter reported that owing to the absence of any funds to provide for further experiments, it had been unable to make any progress during the past year, and that if the committee was to be continued, funds be provided for making tests in order to procure the information necessary to prepare final specifications for truck sides and bolsters.

Capacity Marking of Freight Cars.

THE Committee having charge of this question submitted to the various member companies the following question:

"Whether your company owns or operates any cars the body or trucks of which are strong enough under the present stenciled capacity, but which would not be strong enough under the proposed light-weight and maximum-weight stenciling. If so, give number and class of such cars."

"The majority of the roads vote in the affirmative in answer to this question. Out of the 924 votes, 662 report owning certain cars that are not strong enough and to which it would not be advisable to apply the 'Maximum Capacity' plan of stenciling. While there does not seem to be any doubt, as a rule, regarding the structural strength of the modern car, and its ability to carry the increased load permitted by the 'Maximum Capacity' plan of stenciling, 23 roads report certain types of structurally weak cars, such as flat, gondola, and wooden-underframe cars, which would develop higher stresses under the maximum loading than would be proper or permissible."

In addition, the committee submitted the following question to the members:

"Whether or not it would be more advisable to apply the rule or light-weight and maximum-weight stenciling to steel and steel-underframe cars exclusively, and moreover to such cars of this class as have a factor of safety sufficient to carry the maximum load; also, in the opinion of the members, what the minimum factor of safety should be for maximum loading, stenciling."

"Of the 924 votes represented, 443 (12 roads) are in favor of confining the 'maximum weight' method of stenciling to steel and steel-underframe cars, two lines did not vote directly on the question, and 463 votes (21 roads) do not approve of this plan; some on the grounds that it should apply to all classes of cars whose strength would permit it, others on the ground of confusion to shippers, etc."

"In line with the limited views expressed as to factors of safety, we feel that the light-weight and maximum-load stenciling should be confined to cars of steel or having steel underframes that have a factor of safety of three or better in the body structure, when figured for the maximum load, and with respect to trucks under such cars, the rule should be applied to all trucks having arch bars of M. C. B. dimensions or better, and to all trucks having cast-steel side frames, and to the various forms of special trucks such as pedestal type trucks of the box and other varieties, where the strength of factor of safety is equal to or greater than the equivalent M. C. B. arch bar."

The committee recommends that pending further investigation by it, the subject of stenciling on light weight and maximum load be referred to the American Railway Association in order to ascertain whether there are operating or traffic conditions which would interfere with the proposed method of stenciling.

Lettering Cars.

THE Committee on Lettering Cars, after conferring with representatives of the Superintendents' Association of St. Louis, with reference to the suggestions of that body that separate letters be placed on each side of car, near the door hasp, for seal record purposes, so that such records could be taken by letters instead of using the words "north" and "south" or "east" and "west" with reference to the sides of cars, reported adversely upon the proposal for additional lettering, but suggested that inasmuch as the matter was one designed for the benefit of the operating department, a letter ballot be taken to ascertain the views of all of the members of the Association.

Digitized by Google

Air Brake Hose Specifications.

THE Committee having charge of this subject presented a complete set of specifications for air brake hose, constituting a revision of the recommended practice adopted in 1901, advanced to standard in 1903 and revised in 1905. The new specifications are to be referred to members for letter ballot.

Revision of Form of Present Specifications.

THE Committee on Revision of Form of Present Specifications reviewed during the past year the existing specifications with a view of harmonizing the form and bringing about any changes in substance which might be necessary. The committee followed the outline of instructions prepared for this work, corresponding closely with the existing standard of the Committee on Style of the American Society for Testing Materials. The specifications, after they had been re-drawn, were submitted to the various chairmen interested in the subject, for their approval, which was obtained. The committee recommended that the instructions covering the form of specifications be adopted by the Association for future use in preparing specifications; that the specification for iron axles be discontinued from the standards of the Association; that certain items in the rejection limits need correction, and that a special committee should be appointed for this purpose, and that specifications should be prepared covering about forty items of material for which no specifications now exist. The various changes in specifications recommended cover a wide range and are set forth at length in the report of the committee.

Damage to Freight Car Equipment by Unloading Machines.

THE Committee appointed to investigate this subject took advantage of the investigations already made by the Pennsylvania, the Lake Shore, the Baltimore & Ohio and other systems. After a careful investigation, the committee reported that the principal features to be considered in providing protection of cars from damage by unloading machines are:

"First: Provide as much bearing as possible on cradle side for car and at the same time insure ample clearance for safety appliances and other attachments projecting beyond side stakes of car.

"Second: Allow for sufficient variation for spotting cars in cradle, so that time will not be lost in placing cars, with a resulting decrease in the capacity of car dumper. The protection should be so placed that when a car is stopped anywhere within two feet said blocking will be ample to support car on its side. A greater allowance than two feet is to be preferred when it can be provided without making a supporting area so small that car will be damaged.

"Third: Provide blocking so that the bearing face can be quickly renewed, so that it may be maintained in proper condition at all times by applying same when machine is idle, to avoid necessity of shutting down dumper to apply blocking.

"Fourth: Provide guide plate at in-bound end of cradle for entering cars with spread sides, as per Plate 4, Figs. 1 and 2.

"Fifth: Machine to be provided with not less than four vertical clamps, and each of these to be equipped with extension clamp.

"Sixth: Grade of yard track leading into cradle to be of 100 feet radius, to prevent damage to carry irons when cars are moved into machines coupled.

"Seventh: Timber lining to be cut at angle at lower ends to permit contents spilled into cradle to get out on next turn of cradle.

"Features to be considered in addition to the above, but only on solid floor type machines, are:

"Eighth: No side pressure to be used which will force car against lining in cradle with a pressure greater than the combined weight of car and contents.

"Ninth: Vertical clamps to be operated by gravity so that pressure on top of car will not exceed that now used in movable-platen type machines.

"Tenth: Top of I-beam in floor system and just outside rail to be made same height as rail."

Electrical

Electrification at Chicago.

THE ordinance introduced in the Chicago City Council requiring the railroads entering that city to electrify their lines, has emerged from committee, having been amended therein so as to extend the date after which no steam locomotive can be operated in the city until July 1, 1915. The ordinance passed first reading on June 3rd, with one dissenting vote. Mr. Harry A. Wheeler, of the Chicago Association of Commerce, and Mr. Robert Redfield, representatives of the Pennsylvania group of railroads, urged the committee not to take action until the commission now investigating this subject makes its report. It is the general impression that the railroads will vigorously oppose the ordinance when it comes up for final action, and that in the event of its passage, a long legal battle will ensue. It is held to be unfair to force the railroads into this tremendous expenditure while the terminal question is yet undecided and while no definite plan has been worked out as regards the best method of electrifying, both from the standpoint of the city and of the railroad companies.

Progress of Electrification in the United States.

IT is interesting at times to take account of the extent to which any large movement, such as the electrification of steam railroads in the United States, has progressed. Such an inventory, or analysis, brings out many interesting facts which cannot be properly appreciated in the day to day examination of current events, and shows how rapidly or how slowly a great movement is progressing. Such a comparison

Digitized by Google

has been made by the "Electric Railway Journal" which, in its issue of June 7th, reviews fully but briefly the work of electrification thus far completed or announced by the various large railroad systems of the country. The article is illustrated by a number of excellent maps showing the sections of the country in which important electrification has been undertaken. According to the "Electric Railway Journal" the electrified steam railroads of the United States in operation or under construction are as follows:

Railway.	Miles of Single Track.	Electrification System of	Mileage Total
Baltimore and Ohio	7.4	Low voltage d.c.	....
N. Y., N. H. and H. and B. and M.	104.4	Low voltage d.c.	....
New York Central Lines	371.6	Low voltage d.c.	....
Pennsylvania System	435.5	Low voltage d.c.	....
Total of low voltage direct current			918.9
Butte, Anaconda and Pacific	90.0	High voltage d.c.	....
Southern Pacific	96.0	High voltage d.c.	....
Total of high voltage direct current			186.0
Grand Trunk	4.0	Single-phase	....
Erie	40.0	Single-phase	....
N. Y., N. H. and H.	490.4	Single-phase	....
Total of single-phase			534.4
Great Northern	6.0	Three-phase	....
Total of three-phase			6.0
Grand total			1645.3
Lines Approved for Electrification.

Grand total			1249

*Paoli electrification, mileage approximate.

An analysis of the sections of the country electrified by the various systems included in the above total shows that to a large extent the work of electrification has been confined to mountain divisions where there are very heavy grades and severe operating conditions, with cheap water power or low grade fuels. In addition, a large amount of electrification has been undertaken in connection with vast terminal projects or the handling of heavy suburban business. Thus beginning from the two extremes, where the most severe operating conditions are encountered, the work of electrification is gradually expanding so that a larger and larger proportion of the entire system is coming under its sway. The day is far distant, however, when even a single system will be entirely operated with electricity. Many important questions, such as that of a system of power distribution, have yet to be worked out. In the above table it will be seen that there is a wide divergence in the practices of the different systems, and it will require some time to work out the economic limitations of each system in connection with heavy transportation work.

The same issue of the "Electric Railway Journal" contains an interesting article on the maintenance of the electrified section of the Erie Railroad—a part of the Rochester Division, including the line between Rochester and Mount Morris. This line is in many ways similar to the modern interurban road, it being operated with an overhead catenary construction, with a trolley voltage of 11,000, using single phase current. In large part, the cars are run as single units, and in general the system partakes more of the nature of a trolley road than of an ordinary steam road electrified.

Additional Details Concerning Norfolk & Western Plans.

THE main outlines of the plan of electrification now under preparation for the Norfolk and Western Railway were outlined in the June issue of the "Railway World." Additional details concerning these plans are now available. It is reported that the electrification was designed for the handling of coal trains, passenger trains being handled through the electric zone by steam locomotives. The heavy coal business originates west of the summit of the Alleghenies and is in large part hauled eastward over grades of from 1.5 per cent to two per cent. The coal trains originating on the division are at present filled out generally to a weight of 3250 tons from the various workings along the line and hauled over the grades at a speed of about 7½ m. p. h. by three Mallet engines, one at the head of the train and two pushing. The Mallet engine equipment is used locally on this division, and under electric operations these engines will be displaced by electric locomotives, allowing the Mallets to be used on the other regular divisions of the road.

It is not the intention at present to conduct the through merchandise freight or passenger service by electricity, the electric service being confined to traffic designated as "tonnage trains" originating on the electrified section. These tonnage trains of 3250 tons will be electrically operated by head engines and pushers at a speed of about thirteen miles per hour up the heaviest grades. The number of trains handled up the grade will be about twenty per day, comprising a daily tonnage of 65,000, but the design of electrical equipment will be such that this tonnage can be progressively increased in the future as the occasion requires.

Electric power will be generated in a steam power house to be erected by the company at Bluestone, which is on the line of the railway, about one-third the way from Bluefield to Vivian. This power house will have an installed capacity at present of 24,000 kw. All work is to be completed for service in the summer of 1914.

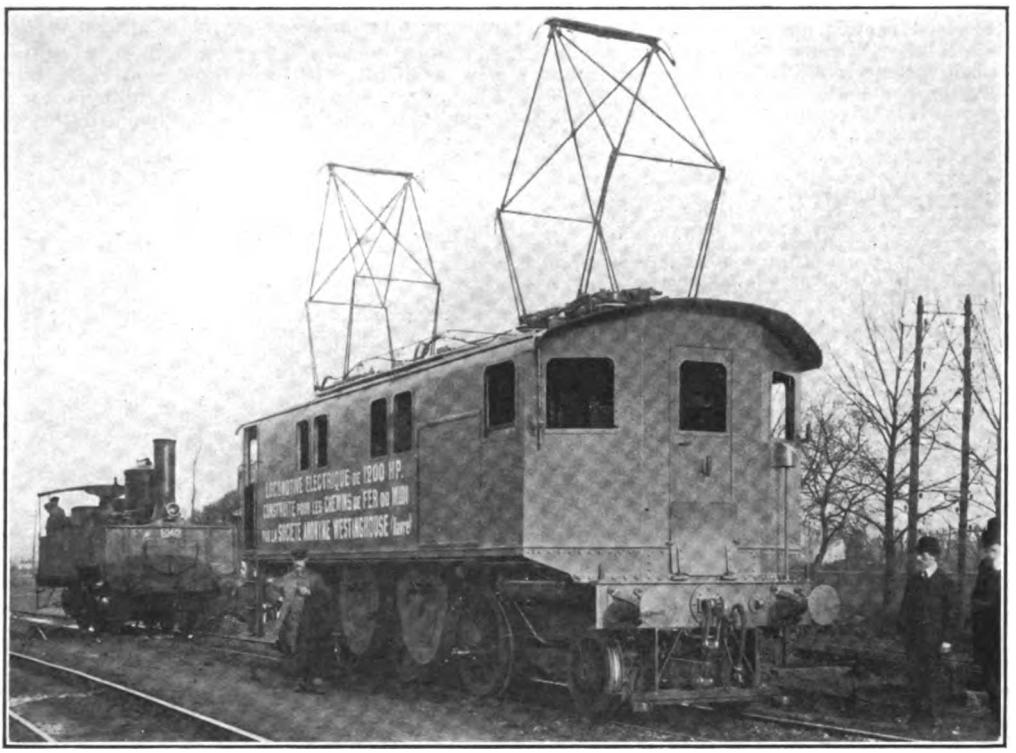
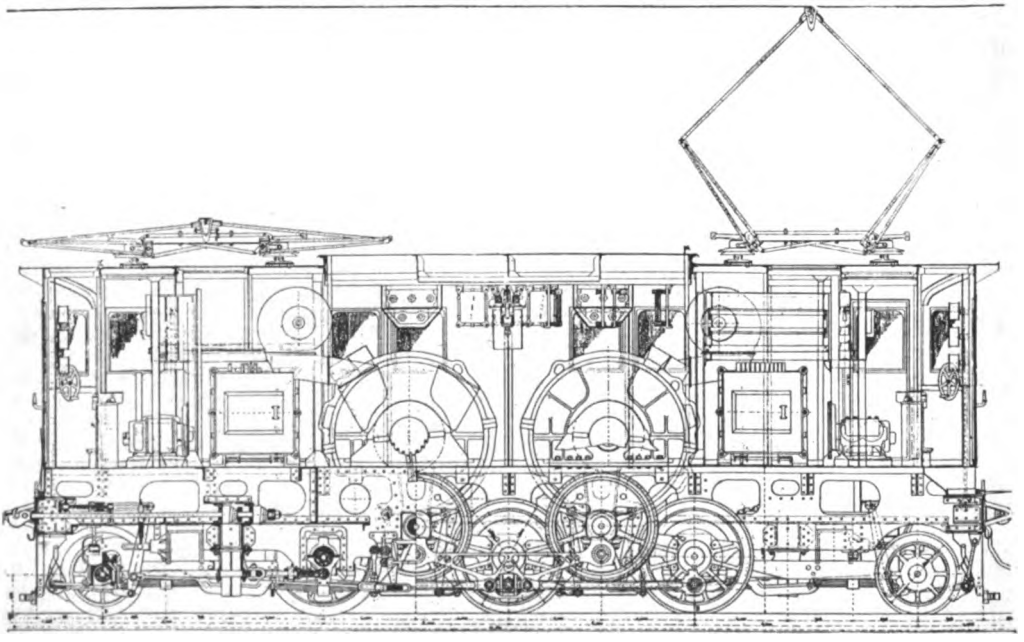
Electric Locomotives on the French Midi Railway

THE accompanying illustration shows the design of a 1,200 horsepower electric engine built by the Societe Anonyme Westinghouse at Havre, France, for the French Midi Railway. The total wheel base is eight meters while the rigid wheel base measures four meters



FRENCH ELECTRIC LOCOMOTIVE WITH TOTAL WEIGHT OF 81 TONS.



SIDE ELEVATION OF FRENCH ELECTRIC LOCOMOTIVE.

Digitized by Google

and the diameter of the driving wheels, 1,200 millimeters. The total weight is 81 tons, of which the mechanical equipment weighs 38 tons and the electrical equipment 43 tons. The electro-pneumatic system of multiple control is utilized, and the regulating step down transformers permit a lowering of the line pressure from 12,000 volts with a frequency of 16 2-3 periods to the lower voltages at which the electric motors are operated.

The maximum tractive effort of the locomotive is 12,500 kilograms, and at 8,000 kilograms a speed of 42 kilometers is attained, this being increased to 60 kilometers per hour with a tractive effort of 4,200 kilograms, the locomotive being able to haul trains of 100 tons, 280 tons and 400 tons on grades of 1.7 per cent, the speed varying in proportion to the tonnage of the train.

The maximum speed for which this locomotive was designed for regular service is 75 kilometers per hour. The overall dimension of the engine are of interest. It has a total length of 11,370 millimeters (11.3 meters) the height to the top of the cab being 3,855 millimeters (3.85 meters) and the width of the cab 3,050 millimeters (3.05 meters).

One of the questions which received great attention in the construction of these locomotives was the method of transmitting the power generated by the motors to the driving wheels, as opinions differed as to whether the motors should be of the geared type, or whether they should be built for comparatively slow speeds, and driving the wheels by means of rods. The French Thomson-Houston Company decided upon the latter scheme using two slow speed motors having cranks at each end of their shafts. The connecting rods coupled these cranks to the auxiliary shafts placed on the same plane as the wheel axles and from these auxiliary shafts the power is transmitted to the six driving wheels by horizontal side rods. The motors are placed close to the center of the locomotive and the connecting rods are inclined at the greatest possible angle.

Governor Sulzer Vetoes Hydro-Electric Bills.

GOVERNOR SULZER, of New York, on May 28th, vetoed the Murtaugh hydro-electric bill designed to permit the utilization of the surplus waters of the canals of the city for the development of electric power, and the Walters bill which would have permitted quasi-public corporations to impound waters through the use of dikes, watersheds and other structures and to market the power.

The Governor says that while he is in sympathy with the purposes sought to be accomplished by the Murtaugh bill, whose principal sponsor was Lieutenant-Governor Martin H. Glynn, yet he questions the wisdom of some of its provisions and the selection of Vischer's Ferry on the Mohawk River as a site for the development of the power. He points out that the friends of the Barge Canal opposed the plan because they believed it would cripple the efficiency of the new canal.

"Experts are all in accord," says the Governor, "that the greatest natural undeveloped water power in this country is the Long Sault, along the St. Lawrence, on the northern frontier of the State of New York. The water power here is tremendous and the uniformity of volume, during all the seasons of the year, unsurpassed, for the reason that the Great Lakes, the largest body of fresh water in the world, form an unparalled natural reservoir."

The Governor characterized the Walters measure as "a mischievous bill and calculated to do much harm." He says: "the extraordinary powers conferred, so far as I know, are without legislative precedent."

New Haven's New Electrical Repair Shop.

A NEW electrical repair shop designed to handle all of the now extensive electrical equipment of the New York, New Haven & Hartford Railroad, costing $650,000 and covering two acres of ground, is nearing completion in Van Nest, Bronx Borough, New York City. It is expected that it will be in operation by August 1st, or a short time before the electrification of the road from Stamford to New Haven is finished.

The electrical equipment of the New Haven road is assuming large proportions, it having a total of 99 electric locomotives and 23 multiple-unit motor cars. Forty-seven of the locomotives are used in the passenger service, 36 for freight and 16 as switches. The freight engines are 50 feet long and weigh 150 tons. They have four drivers on a side, and these are driven by eight motors. They will exert a maximum tractive effort of 40,000 tons and will haul a 1,500-ton freight train at a maximum speed of 35 miles an hour.

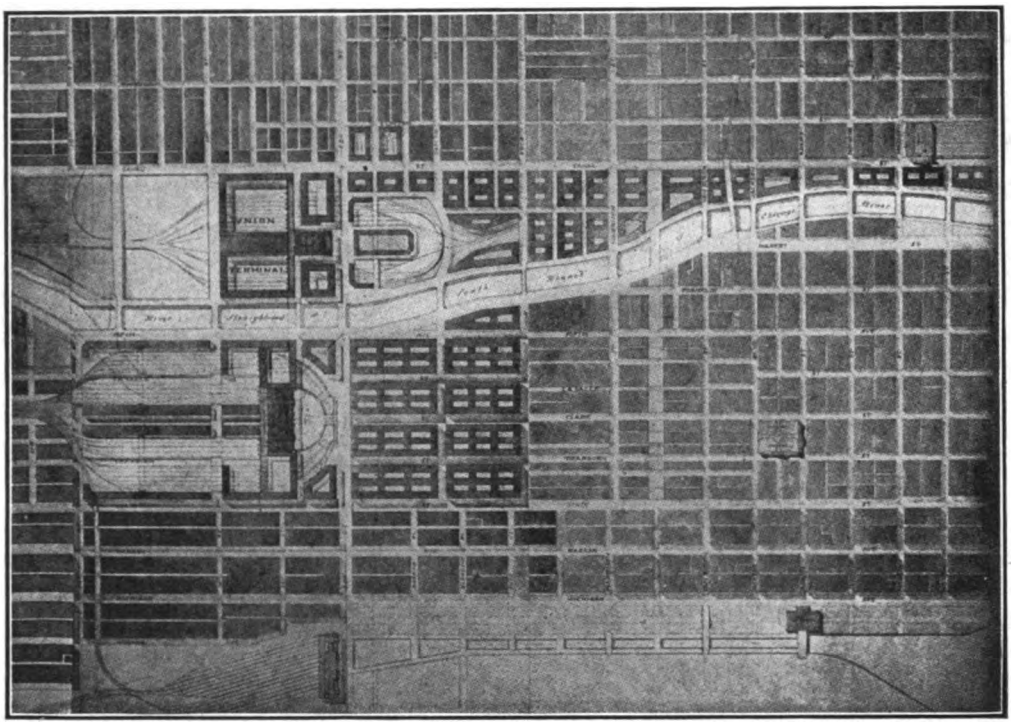
Terminal Improvements

The Relocation of Chicago Railway Terminals.

THE Chicago Plan Commission, at a hearing on May 24th, proposed a new plan for the relocation and co-ordination of the railway freight and passenger terminal system of Chicago, to the City Council Committee on Railway Terminals. The plan proposed follows in a general way the scheme prepared several years ago under the title "The Plan of Chicago" by a committee of the Commercial Club. The plan is based mainly on the idea of Mr. F. A. Delano, president of the Wabash, for a series of terminals on Twelfth streeet and the proposals of the original plan of Chicago prepared by Mr. D. H. Burnham. According to the proposed plan for passenger terminals, the Illinois Central- Michigan Central group will occupy their present station. The Western Indiana or Polk Street station group, consisting of the Wabash, Grand Trunk, Santa Fe, Monon, Chicago and Eastern Illinois, Chesapeake and Ohio, and Erie will be united with the Rock Island-New York Central lines or La Salle Street Station group, to occupy the large terminals centering on Clark street. The Union Terminal group, consisting of the Pennsylvania, Burlington, Alton and St. Paul railroads, will receive the Baltimore and Ohio or Harrison Street Station group and occupy the terminal between the river and Canal street. All of these groups will be located upon Twelfth street, which will start from Michigan Avenue and continue to the river.

The general outline of the plan is shown clearly in the accompanying illustration. It will be noted

Digitized by Google



PROPOSED THREE-UNIT PLAN OF PASSENGER TERMINALS AT CHICAGO.

that the freight terminals are to be located north of twelfth street upon such property as is not taken for passenger terminals and such of the station area as can be built over after the electrification has been accomplished. An extensive system of warehouse blocks will be provided east of the river on the area owned by the railroads.

The suburban traffic is to be handled in the Union Terminal west of the river and in the Twelfth Street Station, the idea being to bring these lines as closely in touch as possible with the business district and at the same time prevent undue congestion.

Mr. F. A. Delano, of the Wabash, addressed the committee at the meeting on May 24th, stating that many of the features of the Pennsylvania's plan submitted on that date were bad in that they tended toward a restriction of the business district instead of providing for its expansion. He advocated no particular plan and admitted that there were many difficulties in the way of getting all of the roads to agree on a general scheme. He proposed that the final decision be postponed for a few months to allow the various railroad companies to make a conscientius effort to work out a plan satisfactory to all. The plan proposed by the Pennsylvania contemplates an architecturally attractive head house facing on Van Buren street, and warehouse buildings occupying the block from Van Buren to Harrison Street, with loading and unloading platforms on the block south of Harrison street between Jefferson and Desplaines streets.

This plan was endorsed by the Chicago Real Estate Board by a vote of 95 to 10, and has been approved as well by a number of other organizations. On the other hand, a large number of influential organizations, such as the Chicago Building Trades Council, have endorsed the Union Station plan. An enabling act to provide for the incorporation of a holding company to construct the Union Station with a capitalization not to exceed $50,000,000, was passed by the Illinois Legislature on May 22d. At the present time, three ordinances are before the City Council in behalf of the Union Station project to provide for the necessary street and alley changes in connection with the proposed terminal plan.

Railway Shops of the Canadian Pacific at Ogden, Alberta

THE Canadian Pacific Railway has recently put in operation near Calgary, Alberta Province, Canada, a large shop plant of more than ordinary interest by reason of its size, its complete and modern character and the speed with which it was created.

The work was designed and built in its entirety by Westinghouse, Church, Kerr & Co., consulting and constructing engineers, of Montreal and New York, working under the direction of Mr. J. G. Sullivan, chief engineer of the Western Lines of the Canadian Pacific Railway, and Mr. N. E. Brooks, division engineer.

Digitized by Google

GENERAL VIEW OF CANADIAN PACIFIC RAILWAY SHOPS AT OGDEN.

The shop location is at Ogden (named in honor of a vice-president of the railway) and is 4½ miles from Calgary and about 2,250 miles from Montreal. Its distance from those sections of the country where the greater part of the construction materials, machinery and equipment were produced constituted the first and one of the most important problems. A second important problem arose on account of the construction season being extremly short, owing to the high latitude, frost remaining in the ground until about April 1st and returning with snow as early as October first. A third very important problem was the comparative scarcity of labor in the Canadian Northwest, this condition being greatly aggravated during the late summer months when harvesting begins and all labor markets are practically drained of men.

Plans had, therefore, to be drawn, materials ordered, deliveries made and complete field organization perfected so that the shops could be closed in between April 1st and December 1st, and sufficiently heated so that inside work could be continued after cold weather had set in.

MAIN BUILDING FROM WEST, SHOWING BLACKSMITH AND BOILER SHOP LAYS.

The shops consist in general of: Main locomotive shop (including erecting, machine, blacksmith and boiler shops), tender and wheel shop, pattern shop and pattern storage, foundry, storehouse and office building, material platforms and scrap dock, oil house, coach repair and paint

COACH REPAIR SHOP.

shop, freight car repair shop, planing mill, boiler and compressor house, 1,260 ft. yard-crane, miscellaneous structures, including transfer table and pit for coach shop, mess hall, driven wells and water tower, all service systems such as drainage, sewage, fire protection, water supply, etc.

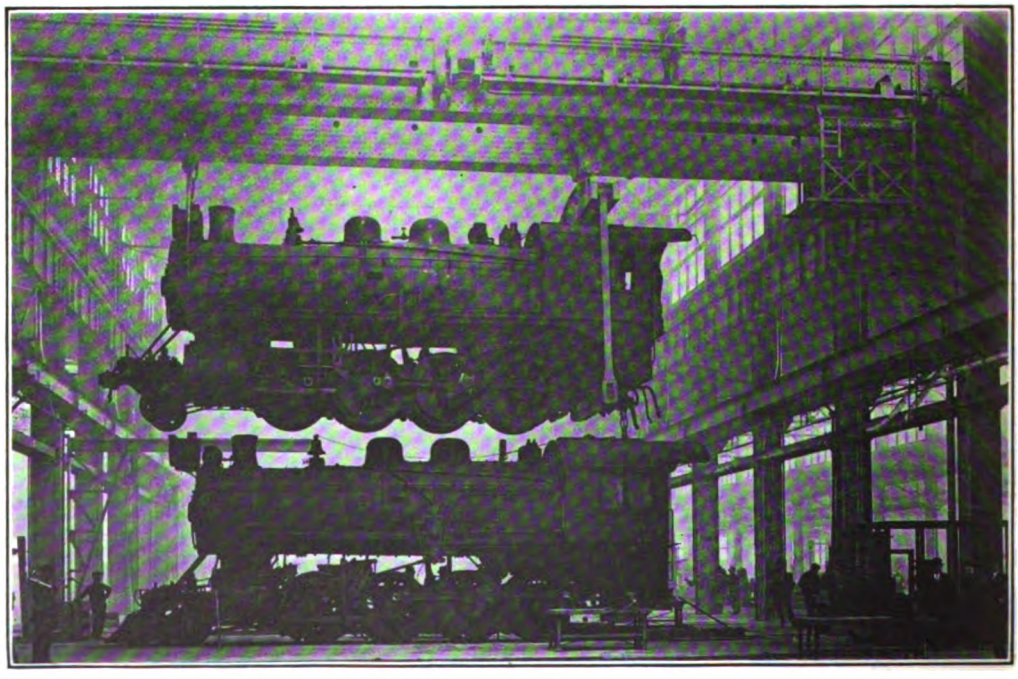
Space does not permit of a detailed description of the various shops and buildings which comprise this modern plant, but a description of the main locomotive shop is of particular interest, in as much as many of its features represent the latest improvements in locomotive shop construction and equipment. This building is designed to contain the erecting shop, machine shop, blacksmith shop and boiler shop.

The erecting shop is of the transverse lift-over type, contains 35 bays, each 22 feet between centers and is 778 feet long by 75 feet wide. The entire area is served by two traveling electric cranes, carried on two levels. A 120-ton crane, furnished with two 60-ton trolleys is carried on the upper level and is used for transferring, wheeling and unwheeling locomotives and handling parts. One of the trolleys on this crane is equipped with a ten-ton auxiliary hoist for handling light material at a high hoisting speed.

Another ten-ton traveling electric crane operates at high speed and serves the entire area of the erecting shop, for handling material in that shop and transferring same to the blacksmith shop and machine shop. The machine shop and the boiler shop are located in adjacent bays on either side of the erecting shop.

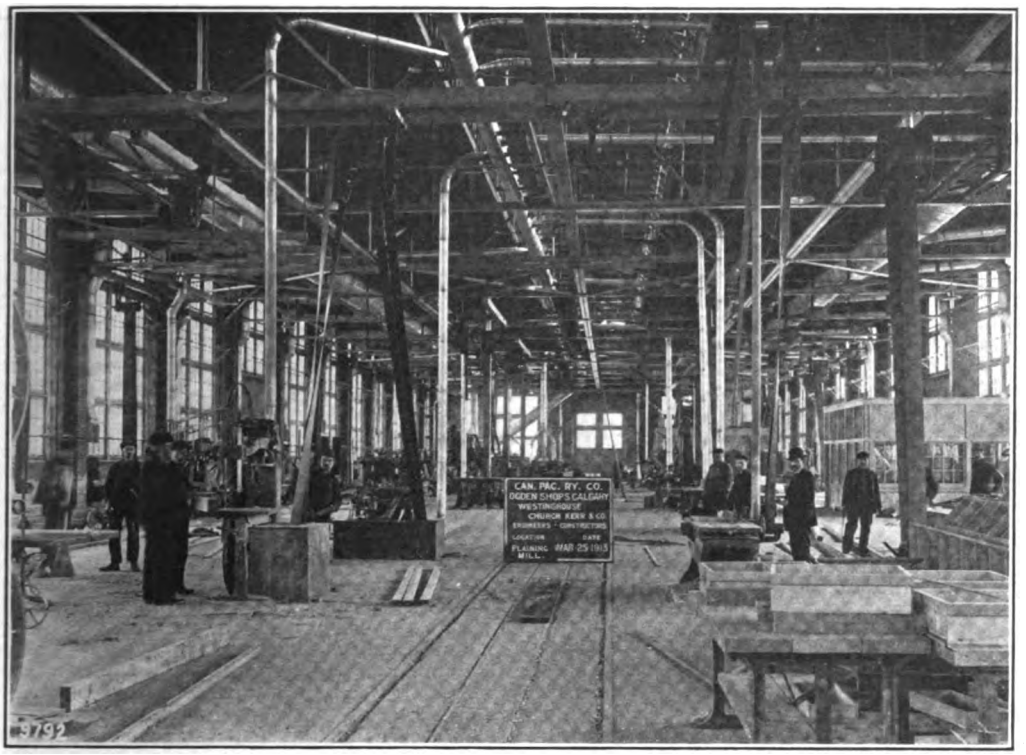
Provision is made on the crane columns in the erecting shop for attaching portable jib cranes for use in dismantling and erecting material on the front ends of locomotives. These cranes are placed where desired by means of the overhead traveling electric cranes.

Entrance for locomotives to the erecting shop is provided through four doors, located in the



INTERIOR OF LOCOMOTIVE SHOP, SHOWING 120 TON LOCOMOTIVE CRANE.

Digitized by Google



INTERIOR OF PLANING MILL.

west side of the shop, two of these doors being located at either end.

For providing additional means for entrance of locomotives, six door openings are provided in the east wall of the machine shop, two of these being at the north end and four at the south end.

All of these entrance tracks are connected up with the erecting pits of the several stalls where they enter the building, to permit of the locomotives moving into and out of the shop through these entrances should this movement become desirable or necessary.

The machine shop for heavy machine tools is located parallel with and adjoining the erecting shop on one side and is 60 feet 9 inches wide and the same length as the erecting shop. A high speed traveling crane of ten-ton capacity covers the entire area of this shop. Material can be brought into the shop through a door provided in the end of the building, the material being brought up to the end of the machine shop by the traveling electric yard crane which travels across the end and outside of the locomotive shop.

Space for the lighter machine tools is provided in a shop 60 feet 9 inches wide parallel with and alongside of the heavy machine and of the same length as that shop. An overhead trolley beam is provided on the bottom chord of the roof truss to permit of using a traveling electric trolley for handling material longitudinally in this shop. Provision has been made for a foreman's office elevated above the floor and having liberal glass surface in the walls so as to give the best possible view of the shop.

The blacksmith shop is located alongside of and parallel with the erecting shop on the opposite side from the machine shop. This building consists of two bays each 332 feet long, 60 feet 9 inches and 50 feet wide respectively.

Space is provided for heavy forging work, steam hammers, etc., in the building immediately adjoining the erecting shop.

The blacksmith shop will not be served by a traveling crane but provision has been made for jib cranes to handle the material from steam hammers, forgings, etc.

In a building of lower cross-section alongside are located the furnaces, bolt headers and other blacksmith shop machinery. This portion of the shop is served by a trolley its full length to facilitate the longitudinal movement of material through the shop.

The space for the boiler shop is provided in a two-bay building, alongside of and parallel with the erecting shop at the end of the blacksmith shop, 352 feet long and the same width as the latter shop.

That part of the boiler shop immediately adjoining the erecting shop is provided with a 40-ton traveling electric crane equipped with two 20-ton trolleys serving the entire area of the boiler shop for handling the boilers and other material.

The riveting tower is located between two of the roof trusses in the end of the boiler shop, with a 25-ton crane for serving the hydraulic riveter.

In the outer of the two bays of the boiler shop, space is provided for a flue shop and boiler shop tools. The entire length of this space is served by a three-ton overhead traveling trolley for

Digitized by Google

handling material through the shop. Space for a flue rattler is provided immediately outside of and adjacent to the low bay of the boiler shop.

An entrance track is provided through the outside wall of the boiler shop on which boilers or other equipment going to this department can be delivered on cars under the traveling crane, for unloading, or may be loaded out for shipment in the same way. This facilitates the handling of boilers from steam shovels, pile drivers, lidgerwoods, etc.

Jib cranes are provided for serving the individual machines in the boiler shop where such service may be necessary.

The heating throughout is done by indirect fan system. For distributing the heated air, underground concrete and tile ducts are used.

The general illumination consists of Cooper-Hewitt lamps with circuit and plug boxes for extension loop cords. Provision has also been made for incandescent lighting circuits for individual lighting at machine tools where required, and for outlet boxes for connecting extension lamp cords to provide lighting for the interior of the locomotive boilers on the erecting floor.

Toilets, lavatories, and metal lockers are provided in the various departments of this shop.

A suitable system of piping is provided for distributing live steam, compressed air, full oil and water for fire protection, drinking and hydraulic pressure.

Outlets for compressed air are provided in duplicate in the sides of each of the engine pits to supply compressed air for operating pneumatic tools.

In the main locomotive shop the electrical feeders from the power company transmission lines are carried in underground ducts, bringing the current at the voltage delivered by the power company, namely, 2,200 volts, to a sub-station located adjacent to and immediately outside of the low machine bay, the transformers for stepping down to 440 volts being located in this sub-station. In this sub-station two motor generator sets for supplying direct current are also located. The switchboard is also located in this sub-station for controlling the power and lighting circuits in the machine shop and for the tender shop and foundry. As far as possible distributing feeders are carried in conduit beneath the shop floor, thereby minimizing the amount of exposed wiring in the shops.

The building containing all of the above departments of the locomotve shop is constructed with structural steel frame carried on concrete foundations. The exterior walls up to the window-sill line are of concrete, above the window sills of hollow-tile plastered.

Ample window area is provided in the side walls and in roof monitors and skylights so as to give sufficient natural lighting.

Good ventilation is obtained through ventilators in the monitors and skylights and by the use of swinging sash in the vertical walls.

With the exception of the blacksmith shop and a portion of the boiler shop the floor throughout is constructed with a 1½ inch asphalt mastic wearing surface which is underlaid with a rough concrete slab about six inches thick. In the blacksmith shop and a portion of the boiler shop the floor is of cinders.

The roof sheathing is constructed of 2x4's, surfaced on one side and one edge and spiked together on edge, thus affording good fire resistance qualities and materially reducing the heat losses. The roof water-proofing is four-ply tarred felt, pitch and gravel, with copper flashing. Suitable drain leaders are provided and connected into underground tiled drains to carry off the water from the roof.

The large skylight on the erecting shop bay is of steel bars lead covered with ribbed wired glass.

For obtaining water for shop purposes there have been put down two eight-inch wells equipped with electrically operated pumps. To supplement this supply and to provide a main source of supply for fire protection the city of Calgary has brought down into the shop site to a point midway the length of the main shop building on the west side, a ten-inch cast iron water main. The shop service and fire lines are connected onto this main and into a steel tank of 125,000 gallons capacity, which is erected on a 70-ft. steel tower, principally for use in connection with automatic sprinklers in the various buildings where these are installed. A complete fire protection system has been put in with hydrants distributed about the shop yard.

The sewage system in the shop yard is divided into the sanitary and storm sewers. The city of Calgary is furnishing the main sanitary sewer, beginning at the east line of the freight car shop and extending to the eastern boundary of the shop property. All the sanitary sewage lines from the various buildings are connected into this sewer. Storm sewers are provided where necessary to carry off the roof water from the buildings where the roof construction is such that this cannot be discharged onto the ground.

The location of the shops is about four and one-half miles east of Calgary, practically on the open prairie and on the beginning of construction arrangements had to be made to house and board on the shop property a considerable quantity of labor. To this end, frame bunk houses were built with two tiers of bunks on each side of the building, eight bunks long, each house having a capacity of thirty-two men. Stoves were placed in the center aisle and benches along the sides of the lower tier of bunks. On the coming of summer and as the labor forces were increased some of the men were housed in standard 12 x 14 wall tents which accommodated four men each. A large mess room and kitchen and storeroom space was also fitted up with a capacity of feeding about 400 men at one time. Great care was exercised throughout the work in keeping the camp in a sanitary condition.

Proposed Terminal Improvements at Baltimore.

PRESIDENT REA, of the Pennsylvania Railroad has recently made public, general plans for terminal improvements at Baltimore, which his company proposes to make, providing it procures the permission of the city government, and which will entail an expenditure of approximately $10,000,000. They include the acquisition of property and construction work at the Calvert Street Terminal and Bayview and Canton. As the following drawing indicates, the improvements contemplate additional main tracks and facilities for handling through traffic, a four-track connection between Union

Digitized by Google

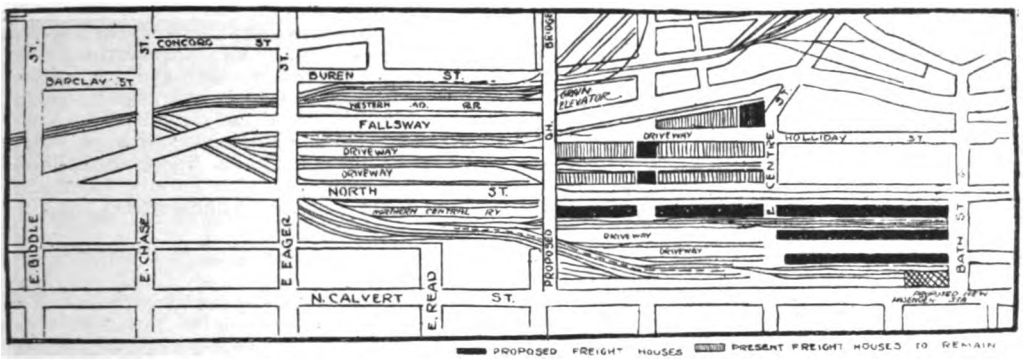


DIAGRAM OF PROPOSED PENNSYLVANIA RAILROAD IMPROVEMENTS AT BALTIMORE.

Station and the Calvert Street Terminal, the southern most point of which is to be at Bath Street. The abandonment of Calvert Station for passenger service or the establishment of a passenger station on the second floor of the terminal at Bath Street, to be reached by passenger trains on an elevated structure above the freight tracks. Enlargement of freight sheds and building of new warehouses at the Calvert Street Terminal.

In order to carry out these plans the railway company asks that the city deed it certain portions of the bed of Madison Street, leaving, however, a driveway on the north side between Constitution Street and Buren Street at the present grade and a driveway on the north side of Madison Street from Calvert Street east to the railroad company's right of way. It also desires a portion of Reed Street, Davis Street, Holliday Street, Franklin Street, Bell Alley and Courtney Alley.

The improvements contemplate the construction of an overhead bridge fifty feet in width, on the southerly side of Madison Street, extending over Calvert Street to Constitution Street, which will avoid all grade crossings of railroad tracks. The proposed bridge will pass under Guilford Avenue Electric Railway viaduct, with an overhead clearance of thirteen feet.

The shaded rectangular blocks shown in the above sketch on Calvert, Bath and North streets, indicate the location of the proposed new freight sheds; there are seven of them. The rectangles with crossed lines indicate the present sheds. At the corner of Bath and Calvert streets, is shown where the new Calvert Station is to be located, if the city insists upon the down-town station. If this is not insisted upon, the down-town station will be eliminated. The proposed overhead bridge on Madison Street is outlined, as is also the arrangement of the tracks. The plans as a whole, constitute the most elaborate railway improvements ever devised for the City of Baltimore.

New Freight Interchange Yards for St. Paul.

OFFICIALS of the Chicago, Milwaukee and St. Paul, have announced that the new freight interchange yards at Godrey, Ill., will be opened for the handling of inbound and outbound traffic within the next six weeks. This addition to the facilities will represent an outlay of several million dollars and will result in a large volume of freight interchange being transferred to the outskirts of the city. The yards, which are three miles long and one-fourth mile wide, extend from Mannheim to Bensonville. Construction work was begun four years ago and sufficient progress was made to enable the company to use the yards for the storage of freight cars during the past two years. Within the last year the company has constructed a roundhouse, machine shop and carpenter shop on the premises.

Baltimore & Ohio's New Tie Treating Plant.

THE Baltimore and Ohio has just completed and put in operation one of the most complete and modern timber-treating plants in this country. It is located at Green Springs, W. Va., and covers sixty acres of ground close to the large timber area along the South Branch Valley of the Potomac River.

The Baltimore and Ohio system requires approximately 2,500,000 ties annually for renewals. A large proportion of these, with other timber for railroad use, will be treated at the new plant. Practically all of the ties now being treated are of oak, approximately about 200,000.

The Alton's Bloomington Shops.

THE Chicago & Alton will soon begin work on the shops at Bloomington, Ill. The Commercial Club there has obtained the land which is to be furnished for this improvement and laborers are expected to start work for the contractors at once. The first work will be on the machine shop, which will be 600 feet in length and will cost more than $500,000.

The Alton has also authorized the construction of a new switching yard with a capacity of 3,700 cars, to be located on the main line at Glenn, Ill. The plans include provisions for constructing an engine terminal, including roundhouses, cinder pits and coaling station.

This is the development of work started two years ago, when tracks with a capacity of about 1,000 cars were built. The yard is intended to relieve the Brighton Park yard, five miles nearer the city.

New Haven's Improvements at Hartford.

THE New Haven system has completed its purchase of land for the increase of trackage of the Canton Street freight yards at Hartford, Conn., and will extensively enlarge this yard for the working out of its new plan of making up freight trains which is expected to considerably hasten delivery at destination. Freight trains are to be made up sys-

Digitized by Google

tematically, cars being added in the order in which they will be dropped off at destination, and this requires greater track facilities.

New Terminal for Dallas, Texas.

PLANS for the interurban terminal station to be built by Stone and Webster, at Dallas, Texas, at a total cost of $2,000,000, have been announced and provide for one of the finest terminals in the southwest.

The building and trackage will occupy an entire city block, the building will be nine stories high, with an immense basement, and there are to be twelve tracks in the train shed. The building will have an aggregate floor space of 155,000 square feet and the train sheds can house thirty-five trains at one time.

All of the Interurban lines now running into Dallas and those which are to be built in the future are expected to use the terminals.

Pennsylvania to Elevate Tracks at Chicago.

TWO million dollars will be expended by the Pennsylvania Company in elevating its tracks in the City of Chicago. The improvement will be completed gradually, as the city council has granted the company seven years to finish the work. One of the largest subways in the city is now being built at West Fifty-ninth Street. It will be 66 feet wide, 650 feet long and have a capacity for forty-six tracks.

Mayor Harrison, has also written letters to the Pennsylvania, Lake Shore and Michigan Southern, urging them to build a subway under their tracks at Seventy-ninth Street.

Station Building in Canada.

CONTRACTS have been awarded by the Canadian Pacific for one hundred and eighty station buildings to be erected along its new line from Montreal to Toronto.

Soo Line Terminal.

THE Soo Line is now employed in excavation work and laying the foundation for an immense freight house and office building at Chicago. The site was acquired at a cost of more than $2,000,000. The ground floor will be used for warehousing purposes and on the three upper floors the receipt and distribution of inbound and outbound freight will be handled.

Interstate Commerce Commission

Commission to Investigate Eastern Rate Situation.

AS discussed more fully in another section of this issue, the Commission, instead of permitting the carriers to re-open the Eastern advance rate cases of two years ago, have intimated that it is their intention to conduct an independent investigation concerning the Eastern rate situation, and hearings for this purpose will probably begin some time in October. Both shippers and railroad officials will be permitted to testify fully, and should the Commission be impressed with the case presented by the railways, it is likely that they will order some general rate readjustment in this territory.

Daniel Willard, President of the Baltimore and Ohio Railroad, in discussing the attitude of the Commission said:

"I am gratified by the action taken because it affords the railroads and the public an opportunity to be heard on the question and I feel confident that the railroads will be able to furnish such evidence as will satisfy the Commission of their necessities. If they do, I believe the Commission will have no hesitancy in giving their approval to such increases in rates as under the circumstances may appear to them reasonable. From the standpoint of the railroads, therefore, I think the reply of the Commission, as we understand it, is entirely satisfactory. The Commission says that being of the opinion from a consideration of the facts in that petition, as well as some other facts within its knowledge, the subject should be at the 'present' time further examined; but that such examination can 'best' be conducted in a proceeding instituted by the Commission in order that they may determine:

"First—as to whether the rates of transportation now in effect in official classification territory yield an adequate return; and

"Second—if not, what plan shall be adopted to increase such transportation charges?

"This is exactly what we are anxious to have done. If the claims of the railroads are well founded, it will be disclosed by the inquiry and if it is ascertained that they do need additional revenue, it appears to be the purpose of the Commission to give consideration to the matter in which such increased revenues can best be obtained. In other words, the carriers are given an opportunity to prove their case and if they do the Commission will give consideration to the best method of securing the necessary increased revenue. Certainly the railroads could not expect more from the Commission at this time and there has been no reason to doubt at any time that they could get less."

While the Commission later cancelled this order to which Mr. Willard refers, it is believed that this was done more on account of its premature issuance, than because of any radical change in the final order which the Commission intimated will be issued shortly.

Boston Loses Differential Rate Case.

AS commented on elsewhere, a supplemental opinion has been issued by the Commission in the so-called Import Differential Rate Case, which sustains the Commission's original decision in this matter. The original case involved an adjustment of rates on import traffic among the cities of Boston, New York, Philadelphia and Baltimore.

In the original report, which the Commission confirms, it was held that the import rates from Boston should not be lower than from New York. In a supplemental report it was held that

Digitized by Google

via certain differential routes on domestic traffic, the import rates need not be higher than the domestic rates for the reason that such an adjustment would simply impose upon shippers the necessity of clearing their import shipments at Boston in order to ship them under the lower domestic rates.

Commission Requires Expert Assistants.

WITH the gigantic task ahead of it of appraising the physical property of the country's railways, the Commission is making an effort to procure the assistance of a large number of railway experts. Through the Civil Service Commission, dates have been set for the examination of men acquainted with railroad operation and construction, and who aspire to enter the service of the Government.

The Commission wants a large staff of structural, electrical, mechanical, railway-signal, and civil engineers, inspectors of car equipment and motive power, and architects. The salaries will range from $1,080, the lowest, to $4.800, but as the work will be mainly done away from Washington, expenses will be allowed while on duty.

The Civil Service Commissioners expect a general response to its call and has fixed July 21st as the closing date on which applications will be received by it.

Future of Express Companies.

IT is apparent that the future of the express companies still rests largely with the Commission and will until it hands down its final rate decree. The parcel post is not likely to affect the total business of the companies more than approximately six per cent, provided it is kept within its present weight and size limits. This represents a loss in the small package business, of approximately forty per cent, which, it is believed, will not be exceeded. Should the service of the parcel post be expanded to include packages weighing up to 100 pounds, the situation would be radically changed, but Government experts seem to agree, at least for the present, that the service under such expansion would be made too cumbersome for shippers to avail themselves of it. Furthermore, it is estimated, that under present conditions, the parcel post service is already being operated at a deficit and it is not likely that the Government will find it expedient to increase this burden.

Rulings on Ocean Freight.

TWO important conference rulings involving ocean freight have been announced by the Commission. Concerning the payment by rail carriers of advance charges on import traffic, the Commission said:

"A rail carrier may not advance charges to an ocean carrier on import traffic, except under a proper provision therefor in its tariffs. When such advance charges are made the freight bill of the rail line must show in separate items the charges so advanced and the charges of the inland carrier or carriers; it must also show the tariff rate or rates of the inland carrier or carriers. The name of the ocean carrier to which the charges are advanced must also be shown.

"To give carriers time in which to adjust their tariffs in conformity herewith this ruling will become effective on August 15, 1913."

The other ruling was announced as follows:

"The Commission holds that it has jurisdiction over shipments moving under tariff recently filed by the Pacific Mail Steamship Company naming proportional commodity rates from San Francisco to Honolulu on traffic moving under through bills of lading and originating at inland points in the United States and moving from such inland points to the port of San Francisco under tariffs filed with the Commission."

Reparation Demanded on Account of New York Strike.

THE National League of Commission Merchants, with headquarters at New York City, have demanded, through the Commission, over $13,000 in reparation from the Pennsylvania Railroad, on account of the strike of freight handlers which occurred in that city from July 10th to 21st, 1912. It is claimed that during that period large shipments of peaches and cantaloupes were prevented from delivery at New York City piers, and that the consignees were forced, at extra expense, to receive these shipments at Jersey City, and from thence haul them to New York. It is largely on account of this hauling expense, that the claims for reparation are made.

Rate Decisions.

THE reduction of ore and coke rates in the Pittsburgh district constitute the most important rate decisions of the month. The Commission ordered a reduction in the rates of iron ore from the Lake Erie ports to the Pittsburgh district in Pennsylvania, and on coke from the Connellsville producing region for any destination East and West.

On iron ore from Lake Erie ports to the Pittsburgh district the Commission orders a reduction of 36 cents a ton or from 96 to 60 cents a ton. On coke the Commission orders a reduction averaging 12 per cent.

The decisions of the Commission are considered the most important handed down by it for a considerable time. The decision of the Commission particularly in the ore case, it is stated, disposes of the defence of the big eastern railroad lines that they have the right to equalize the cost of assembling raw materials at various producing points.

The complaint in this case was brought by the Pittsburgh Steel Company, the largest independent iron and steel producer in the United States, against the Lake Shore & Michigan Southern Railroad Company, the Pittsburgh & Lake Erie Railway Company and others.

In the proceeding the Pittsburgh Steel Company was understood to be considering a test case on behalf of itself and other independent steel companies, and in the evidence it was charged that the rate was maintained by concerted action of the railroads with the purpose and the effect of benefiting the United States Steel Corporation to the disadvantage of the independent steel manufacturers.

The Commission's decision gives the Pittsburgh district the same rate as the Wheeling district, a competing one that is sixty cents a ton.

Digitized by Google

In connection with the rates in question and the connection of the United States Steel Corporation the report says that the matter of allowances to the Steel Corporation by railroads and its ownership of them is now under investigation by the Commission and will be reported upon in a separate case and it continues:

"Full consideration has been given this question of improper influence by the United States Steel Corporation, but it does not seem that sinister influence need be assumed to explain the Pittsburgh rate on ore. This rate may, perhaps, be more properly viewed as one illustration of a common practice in railroad rate making, of charging high rates where the traffic can easily be made to bear it."

Other important cases decided, include the following:

Reduction in the rates on window glass, plate glass and roll glass from the Pittsburgh district to High Point, N. C. Reductions in rates on anthracite coal from points in Pennsylvania to Scotia, New York.

Rates on cement from Ada, Okla., to points in Texas, over the Missouri, Kansas and Texas Railroad, declared to be unreasonable. Rates of 22 cents per 100 pounds on petroleum and its products from points in Kansas over the Atchison to points in Nebraska declared unreasonable. Refusal of the Illinois Central to grant elevation allowance on grain at Decatur, held discriminatory in view of such allowance being made at Cairo, Illinois. Rates on bag and bagging cotton bales and ties over the Arkansas, Oklahoma and Western Railroad, held to be unreasonable. Rates on sugar and molasses from certain producing points in Louisiana to Clinton, Ia., held to be reasonable. Rate of 16½ cents on flaxseed products from Minneapolis, St. Paul to Galveston and other Gulf ports held to be unreasonably low, but the Rock Island and other railroads ordered to keep the route open at a rate not to exceed 22½ cents per 100 pounds. Rate of 53 cents per 100 pounds on machines from Saginaw, Michigan, to Milton, Florida, over the Louisville and Nashville, declared unreasonable. Advance of four per cent in fertilizer rates from Wadsboro, S. C., to various local stations in that State, declared unreasonable. Rates on leather from Cincinnati and various other points in the middle west, to Macon, Ga., over the Cincinnati, New Orleans and Texas Pacific, held to be discriminatory to Atlanta, Ga.; the differential on these shipments favoring Atlanta were reduced from 27 cents per 100 pounds in less than carload lots to three cents and from thirteen cents per 100 pounds in carload lots to two cents. Rates on coal from Bego, Wyo., over the Chicago, Burlington and Quincy to Boseman, Mont., of $2.75 a ton, declared unreasonable. Rates on hay and straw from Beloit, Wis., to Chicago over the Chicago Northwestern, held reasonable. Petroleum rates over the Missouri Pacific from Kansas to Arkansas points, declared reasonable. Rates on glazed paper from Chicago and Mississippi River crossings to Omaha over the Chicago Great Western, declared unreasonable.

On petition of the Illinois and Texas grain merchants, the Commission has prescribed that railroads may charge not in excess of ½ cent per 100 pounds over previous existing rates for grain transportation between the two States.

As a result of its investigation of the use of the wharfage facilities at Pensacola, Fla., the Commission holds that:

"Wharves and the tracks leading thereto, owned by a rail carrier engaged in interstate commerce and used for receiving and delivering property moving by rail in interstate and foreign commerce, are subject to the act to regulate commerce and the regulations and practices affecting their use must be reasonable and nondiscriminatory."

Rate Suspensions.

AMONG the suspensions during the month were the following: Increase in freight rates on wheat from various points in Oregon and Middle Western States to destinations in the Southwest, suspended until September 19th. Advance of six per cent in rates over 100 pounds on potatoes and other vegetables from Louisiana and other Arkansas points to Rocky Mountain territory, suspended until September 20th. Advances in rates on cartridge shells from Chicago, St. Louis and other points to Kansas City and other destinations, suspended until November 29th. Increases in lumber rates over Southern Railway points to Eastern cities, suspended until September 27th. Advances in grain rates in carload lots over certain points in Illinois, Iowa and Missouri, to Toronto, Ont., suspended until July 8th. Advances in rates on paper in carloads from Milwaukee to Kakauna, Wis., filed by the Chicago and Northwestern Railroad, suspended until October 3rd. Increase in class and commodity rates at various points reached by the Delaware, Lackawanna and Western and the Pennsylvania Railroad, suspended until September 17th. Advances in rates on potatoes from points in Oklahoma to points in Colorado, suspended until September 20th. Advances in rates on brooms from Chicago and other interstate points to Denver and other points, suspended until December 10th. Advances in rates on packing house products originating at, or destined to points in Louisiana, Arkansas and Oklahoma, suspended until October 4th. Advances in switching charges at Detroit, Mich., on all classes of freight suspended until December 27th.

Rate Increases.

AMONG the increases that were allowed during the month were the following: Advances in rates on canned goods from points in Iowa to Little Rock and Pine Bluff, Arkansas; advances in rates on shipments of sugar and other commodities between New Orleans and Sterling, Illinois; advances in rates on coal from mines in Kentucky and West Virginia to Milwaukee, Manitowac and Kawanee over the Pere Marquette Railroad.

Rate Increases Denied.

THE Commission has cancelled the following proposed rate increases: On plaster and gypsum rock from points in Kansas to destinations in Arkansas and Missouri; break-bulk rates on grain from points in Wisconsin to Boston, New York, Philadelphia and other Eastern points; advances in rates on salt from Milwaukee, Wisconsin, to points on the Wabash Railroad west of the Mississippi River; advance

Digitized by Google

in the Chicago, Milwaukee and St. Paul switching charge on coal within the Chicago switching limits; advances in the rates on lumber from Southern lumber producing territory to Des Moines, Iowa; advances in freight rates on bituminous coal in carload lots from the mines at Panama, Ill., to Iowa points; advances in rates on bituminous coal from Southern Illinois to points west of the Missouri River; advances in rates on pig iron from producing points in Virginia to destinations in Pennsylvania and New Jersey.

ORGANIZATION NOTES.

Annual Meeting of the Traffic Club of Pittsburgh.

BETWEEN 400 and 500 members of the Pittsburgh Traffic Club, held their annual business meeting and election at the Oakmont Country Club, on June 9th. The officers elected were: President, E. C. Sattley, manager of the Page Woven Wire Company; first vice-president, D. G. Gray, of the Western Maryland Railroad; second vice-president, William F. Morris, Jr., of the Crucible Steel Company; secretary, D. L. Wells; treasurer, J. T. Neison; board of governors, H. G. Dow, John M. Gross, J. B. Nessle, L. C. Bihler and W. A. Sproull.

Following the announcement of the election, the club presented the retiring president, J. T. Johnston, with a gold watch, who in response thanked the club for their support of his administration and requested co-operation in the next. An address on the history of the Traffic Club was delivered after the dinner by Robert Hunter.

Mr. C. S. Belsterling, traffic manager of the American Bridge Company, made the speech of presentation to the retiring president. He said in part:

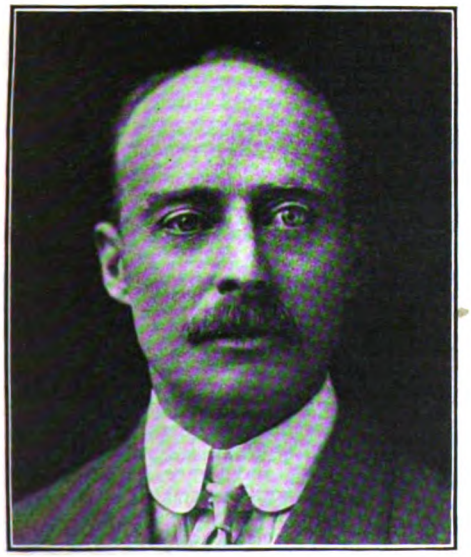
"I have been appointed a committee of one, representing the full membership of this organization, to bring to your attention a well known

C. S. BELSTERLING.
Traffic Manager, American Bridge Co.

psychological fact—namely, that each man's personality is the center of some out-reaching influence—he is an unconscious influence for good or for evil—in a word an influence for construction or for destruction.

"Our retiring president may rightly be enrolled in the Hall of Fame of The Traffic Club, of Pittsburgh. He, too, has been faithful to the task assigned to him, he has worked diligently to maintain the high standard of our organization and has added also another rung in the ladder of our success.

"As a token of appreciation, Mr. Johnston, I am afforded the signal honor to present to you, on behalf of the gentlemen of The Traffic Club,



J. T. JOHNSTON.
Retiring President, Pittsburgh Traffic Club.

E. C. SATTLEY.
Newly Elected President of the Pittsburgh Traffic Club.

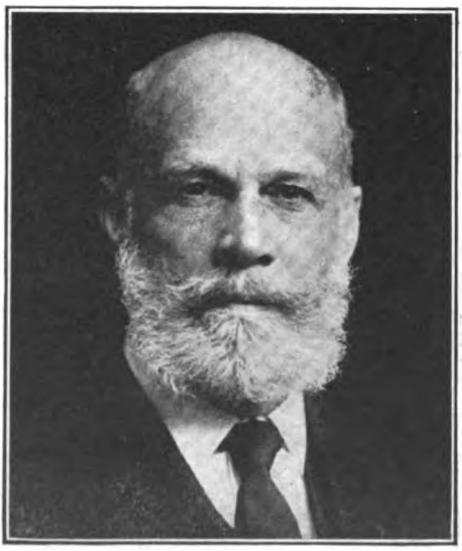
Digitized by Google

of Pittsburgh, this watch—may it tick, and tick and tick forever—indeed figuratively into eternity—ever telling in an audible manner of the friendship we all have for you and our genuinely sincere appreciation of how you have labored so well as our president to press onward and upward the affairs of our Club during the administration about to close."

The New President of the National Association of Manufacturers.

COLONEL GEORGE POPE, of Hartford, Conn., whose photograph is herewith presented, has been elected president of the National Association of Manufacturers. For seventeen years he has been actively connected with important commercial organizations, and as president of the Connecticut State Association of Manufacturers, has been actively engaged in legislative and other work pertaining to manufacturing interests. Colonel Pope, is a director from New England in the Chamber of Commerce of the United States of America, and is treasurer of the Automobile Chamber of Commerce a new organization consolidating the two largest national associations in the automobile industry. The following extracts are from a message from Colonel Pope to the members of the National Association of Manufacturers, issued shortly after his election.

"In this salutation it is appropriate that some outline be presented of my interpretation of the policies enunciated by the Association. On the issue of criminal unionism my adherence to the avowed principles of this organization admits of no misinterpretation; to the backs of the betrayers of honest labor I would be among the first to apply the lash. Organizations of workmen who respect the law and ask no special privileges on account of their organizations, and who believe every man has the right to earn a lawful living in any lawful way, I approve. I am and shall continue in opposition to the un-Christian, un-American closed shop.



COLONEL GEORGE POPE.

Newly Elected President of the National Association of Manufacturers.

"To the breeders and exploiters of industrial and social distress, I say: I believe it is impossible for this nation permanently to endure if class is to be pitted against class, either by legislation or by exemption from operation under existing law. As said by the immortal Lincoln: 'This nation cannot endure one-half slave and one-half free.'

"On the question of tariff I subscribe heartily to the principle of this Association declaring for the establishment of a permanent, non-partisan commission of experts to investigate, compile, and report its findings to the Congress of the United States. No tariff should ever be enacted upon any other basis of information than that the revenue for the support of our Government may be sufficient, and that the manufacturer may still be afforded ample protection as between the differences in the cost of production in our own country and in foreign nations, that our labor may be well rewarded for its share in production and the consumer may be enabled to purchase the full value of the dollar given in exchange.

"On the question of currency I am in hearty sympathy with the policy as enunciated at and adopted by our last convention. Money is, in my judgment, as much of a commodity in the markets of trade as food stuffs; I believe it is as criminal to create a famine in that market by any men or set of men acting in unison as to corner food supplies and thus create famine and panic.

"In the conservation of the human and physical resources of the country, this Association has been a mighty factor. It was among the first to advance and adopt equitable workmen's compensation laws. In the education of youth it has a profound interest; to reduce the tremendous waste of the nation's boys and girls, those who leave school in the earliest grades, I would earnestly urge a system of compulsory industrial training for young people at work.

"In all our efforts to promote the industries of this country; the welfare of our workmen, and our people; the extension of our commerce beyond the seas; in short, the nation's prestige and the nation's honor, let us show a complete sense of our civic responsibilities. That I may fully discharge the great duties of my office as your president, I bespeak humbly the loyal, inspiring support with which you have upheld my predecessors."

Convention of Brotherhood of Railway Trainmen.—At the convention of the Brotherhood of Railway Trainmen held in San Francisco during June, W. G. Lee, of Cleveland, was re-elected grand president.

Other officers elected were:

Assistant president, D. R. Dodge, Cleveland; vice-presidents—first, Val Fitzpatrick, Columbus, O., (re-elected); second, James Murdock, Toronto Ont., (re-elected); third, A. F. Whitney, 482 votes against Martin Degnan, Schenectady, N. Y., 349 votes. Whitney was a candidate both for grand president and for re-election as third vice-president. General secretary and treasurer, A. E. King, Cleveland, O., incumbent; editor of Trainmen, D. L. Case, Cleveland, O., incumbent.

It was decided that in the future, on account of the expense incurred, triennial instead of biennial conventions would be held. In this de-

Digitized by Google

cision the delegates upheld President Lee and the executive officers who favored a three-year intermission between conventions. The Brotherhood has adopted a referendum method for electing officers where the majority of such lodges demand it by vote.

President Lee announced that while no action would be taken by the session upon the question of a strike on the Eastern roads, a referendum vote could be taken by the lodges of the Eastern division, beginning June 15th. Mr. Lee also announced that he was in favor of changing the Erdman Act, increasing the size of the Federal Arbitration Commission from three to six members. The Association approved a change in the organization's insurance methods. All policies hereafter will be paid in full when the holders reach the age of ten. Proposals to adopt a form of paid-up insurance, such as that offered by regular companies, and also to make the loss of one eye total disability, were defeated.

By a vote of three to one, the brotherhood registered opposition to the proposed workmen's compulsory compensation act now before Congress.

The report of the general secretary and treasurer of the Brotherhood of Railway Trainmen showed that more than $8,000,000 had been expended by the Brotherhood in the last two years. In death and disability claims alone during the years 1911-12, nearly $5,000,000 was expended. According to the officials of the organization, it costs $200,000 every time a convention is held.

Resolutions were adopted looking to amendments of the law relating to hours of service. The present law compels a railroad company to give a man ten hours' lay-off after each shift of sixteen hours, but it is asserted that men often are kept at work for much longer periods on the prtense that their train has been idle a considerable part of the time and actually moving only sixteen hours. The railroad men would have the law limit their services to sixteen hours continuous duty, regardless of all other conditions, except those brought about by a wreck.

Another movement set on foot is intended to bring about legislation placing a minimum of $100 fines for violation of the full-crew law.

Annual Session of Brotherhood of Locomotive Firemen and Enginemen.—At the annual convention of the Brotherhood of Locomotive Firemen and Enginemen, held in Washington during June, it was voted to continue the headquarters of that organization in Peoria, Ill., for the present, but the question was not finally disposed of. Ratification was also obtained of and general working agreement with the Brotherhood of Locomotive Engineers, the agreement having been approved by the latter body at its recent meeting in Chicago. Under the agreement the two organizations hereafter will work in harmony on all questions in issue between them and the railroads of the country. The convention also discussed the proposition of having a legislative congress composed of representatives from each lodge in the various States, elect a national legislative representative to be stationed in Washington. No action, however, was taken. The sessions lasted almost the entire month of June and over one thousand delegates were present. All employes engaged in the operation of electric locomotives were made eligible for membership in the Brotherhood of Locomotive Firemen and Enginemen by an amendment to the constitution.

American Railroad Employes' and Investors' Association Disbands.—At a meeting on April 15, 1913, the Executive Committee of the American Railroad Employes' and Investors' Association, having considered carefully all the conditions, the work accomplished and probable future needs and support by the membership, concluded that it is not desirable to continue the general work of the Association.

Accordingly further operations of the general organization and offices were ordered suspended as of June 1, 1913.

In taking this action the committee voiced its satisfaction with the work accomplished and the intention not to prejudice continuation of its branches locally where desired or further work along the lines of the movement in territories where deemed expedient.

All application fees collected from employes since June 1, 1912, will be refunded.

The general officers of the Association express to the members their sincere appreciation of the support and co-operation which has been rendered.

Convention of Order of Railway Conductors.—At the convention of Railway Conductors, held in Detroit, Michigan, the latter part of May, it was decided that the next grand division meeting, would be held in St. Louis in 1916.

Annual Convention of Traveling Engineers' Association.—The Traveling Engineers' Association, is to hold its 21st annual convention in Chicago, from August 12th to 15th inclusive. Among topics to be discussed are: Means for minimizing the smoke evil; Scientific train loading; Care of locomotive brake equipment and the Operation of superheated locomotives.

Annual Convention of Railway Mail Clerks.—The National Railway Mail Clerks' Association, which held its annual convention in Cincinnati, the latter part of May, decided not to meet again for two years and to have biennial conventions regularly hereafter for the sake of economy. San Francisco was chosen as the next meeting place. It was also decided to include a referendum clause in the constitution of the Association.

R. E. Ross, of Ludlow, Ky., was elected to succeed George Wood, of Portsmouth, N. H., as secretary-treasurer. Mr. Wood has held the office for twenty years and withdrew in favor of Mr. Ross. P. J. Schardt, of Milwaukee, Wis., was re-elected president.

Annual Convention of Railway Storekeepers.—The Tenth Annual Convention of the Railway Storekeepers' Association, was held in Chicago, on May 20th. J. R. Mulroy, general storekeeper of the Pullman Company, presided. One of the chief addresses was delivered by George Yeomans, a consulting engineer and formerly assistant to the president of the Wabash Railroad.

Mr. Yeomans pointed out that railroads throughout the country spend $250,000,000 annually for supplies, and urged all storekeepers to adopt methods which will result in greater efficiency.

The officers elected for the ensuing year are

Digitized by Google

as follows: President, G. W. Gerber, Washington, D. C.; first vice-president, G. G. Allen, Milwaukee; second vice-president, H. C. Pierce, Sacramento, Cal.; secretary-treasurer, J. P. Murphy, Collinwood, Ohio.

Baggage Agents Elect President.—At the recent annual meeting of the American Association of General Baggage Agents, held in Chicago, F. J. Moore, general baggage agent of the Nickle Plate, was elected president; George L. Alley, general baggage agent of the Union Pacific, was chosen vice-president and John E. Quick, general baggage agent of the Grand Trunk, was made secretary and treasurer.

Claim Agents' Convention.—The 24th annual convention of the Association of Railway Claim Agents, recently held in Baltimore, resulted in the election of W. B. Spalding, of St. Louis, as president. The next year's convention will be held in St. Paul. About 250 delegates were in attendance, representing the principal railroads of the United States, Canada and Mexico. One of the chief topics of the convention, was the "Safety First" movement which has a vital connection with the activities of the claim departments.

ELECTIONS AND APPOINTMENTS.

Executive.

F. W. Allen, director, Chicago and Eastern Illinois R. R. Headquarters, New York.

W. B. Biddle, vice-president, in charge of traffic and development, St. Louis & San Francisco R. R.

William A. Bissell, president, San Francisco-Oakland Terminal Railway.

Benjamin Campbell, vice-president, Boston & Maine R. R. in charge of Traffic Department. Headquarters, Boston, Mass.

F. I. Coblentz, vice-president, Hagerstown & Frederick R. R.

Robert Collett, president, International Railway Fuel Association.

A. Douglas, vice-president, in charge of books and accounting, St. Louis & San Francisco Railroad.

Newman Erb, president, Denver & Salt Lake.

W. A. Fallett, receiver, A. N. & S.

A. S. Greig, assistant to receivers, St. Louis & San Francisco Railroad.

F. A. Hibbert, director, Chicago and Eastern Illinois R. R. Headquarters, Chicago, Ill.

J. H. Hill, vice-president and general manager, Galveston, Houston & Henderson. Headquarters, Galveston, Texas.

C. F. Holt, director, Chicago and Eastern Illinois R. R. Headquarters, Chicago, Ill.

H. C. Hooker, assistant to the president, Erie Railroad. Headquarters, New York.

Howard Ingersoll, assistant to senior vice-president, New York Central Lines.

T. W. Irwin, president, Peoria, Galesburg and Western Electric Railway Company.

W. J. Jackson, president, Chicago & Eastern Illinois R. R.

Chauncey Keep, director, Chicago and Eastern Illinois R. R. Headquarters, Chicago, Ill.

A. W. Krech, vice-president, Chicago and Eastern Illinois Railroad.

W. H. Lyford, director, Chicago and Eastern Illinois R. R. Headquarters, Chicago, Ill.

George McCall, president, Catawissa Railroad.

John W. McDowell, vice-president, Galesburg and Western Electric Railway Company.

J. T. Morrison, vice-president, Pullman Railroad Co.

P. H. Morrissey, assistant to vice-president Byram, Chicago, Burlington & Quincy R. R.

W. E. Morse, vice-president and general manager, Denver & Salt Lake.

Samuel Naphlay, president, Nevada County Narrow Gauge R. R.

W. C. Nixon, vice-president in charge of maintenance and operation, St. Louis & San Francisco R. R.

G. H. Parker, assistant to third vice-president, Delaware and Hudson. Headquarters, New York.

E. P. Peck, president, Hagerstown & Frederick Railroad.

H. H. Porter, chairman board of directors and the executive committee, Chicago & Eastern Illinois R. R.

F. H. Rawson, director, Belt Railway Company of Chicago.

Alexander Robertson, assistant to the president, Missouri Pacific. Headquarters, St. Louis, Mo.

Thad W. Roedecker, receiver, Pekin and Petersburg Electric Line.

H. N. Rose, director, Chicago and Eastern Illinois R. R. Headquarters, Chicago, Ill.

C. E. Schaff, president, Houston & Brazos Valley R. R.

Theodore P. Shonts, member of board of directors, Chesapeake & Ohio Railroad.

Harold Vanderbilt, director, New York & Harlem Railroad.

Henry A. Vernet, director, Chicago and Eastern Illinois R. R. Headquarters, London, England.

Thomas H. West, receiver, St. Louis & San Francisco.

Henry A. Wilkie, assistant to chairman of the Board, Chicago Railway Company.

B. L. Winchell, receiver, St. Louis & San Francisco.

E. W. Winter, receiver, Chicago & Eastern Illinois.

Legal.

Judge John Madden, general solicitor, Kansas, Nebraska and Colorado for Missouri Pacific. Headquarters, Atchison.

Bruce Wyman, consulting counsel, New York, New Haven & Hartford R. R.

Financial.

H. B. Blanchard, secretary, Denver & Salt Lake.

Clifford Ireland, secretary-treasurer, Galesburg and Western Electric Railway Company.

Frank J. Lawlor, acting treasurer, Chicago, Terre Haute & Southeastern. Headquarters, Chicago, Ill.

Ward E. Pearson, treasurer, Denver & Salt Lake.

A. W. Swanitz, assistant treasurer, Alaska Northern Railway. Headquarters, Seward, Alaska.

Digitized by Google

Accounting.

A. Douglas, chief accounting officer, St. Louis and San Francisco.

W. C. Logan, chief clerk to the auditor, Ft. Worth & Denver City. Headquarters, Ft. Worth, Texas.

John M. Metheany, secretary and auditor, Grand Rapids & Indiana Ry. Headquarters, Grand Rapids, Ind.

W. B. Patterson, assistant auditor, Chicago, Indianapolis & Louisville Railway. Headquarters, Chicago.

C. S. Snow, auditor, St. Louis, San Francisco & Texas R. R.

Engineering and Mechanical.

Joseph Acker, superintendent of car department, Chicago Terminal Division, Chicago, Rock Island & Pacific. Headquarters, Blue Island, Ill.

Frank B. Barclay, motive power superintendent, Illinois Central Lines. Headquarters, Memphis, Tenn.

J. D. Black, resident engineer, New York Central & Hudson River R. R. Headquarters, Rome, N. Y.

M. C. Blanchard, office engineer, Atchison, Topeka & Santa Fe R. R. Headquarters, Topeka, Kansas.

N. E. Brooks, maintenance of way engineer, Western Lines, Canadian Pacific Ry.

W. S. Burnett, district engineer of construction, Cleveland, Cincinnati, Chicago & St. Louis Ry. Headquarters, Middletown, Ohio.

J. A. Carney, superintendent of shops, the Burlington. Headquarters, Aurora, Ill.

P. J. Carter, office engineer, Western Lines, Atchison, Topeka & Santa Fe. Headquarters, Amarillo, Texas.

E. G. Chenoweth, mechanical engineer, Rock Island Lines. Headquarters, Chicago, Ill.

A. B. Clark, assistant engineer maintenance of way of roadway and track, Pennsylvania Railroad.

W. F. Devine, superintendent of motor cars, Chicago, Peoria and St. Louis.

K. A. Dunphy, resident engineer, Canadian Pacific Railway. Headquarters, Calgary, Alta.

William H. Dyer, master mechanic, Georgia & Florida Ry. Headquarters, Douglas, Ga.

J. R. Edwards, general inspector of motor cars, Lehigh Valley Railroad Company. Headquarters, South Bethlehem, Pa.

R. B. Elsworth, engineer maintenance of signals, New York Central & Hudson River. Headquarters, Albany, N. Y.

G. H. Friend, assistant chief engineer, Western Maryland Ry.

H. W. Gardner, supervisor of materials, Lake Shore Division, Lake Shore & Michigan Southern Ry. Headquarters, Cleveland, Ohio.

F. G. Glover, electric engineer, Rock Island Lines. Headquarters, Chicago.

G. S. Goodwin, mechanical engineer in charge of locomotive design, Rock Island Lines. Headquarters, Chicago, Ill.

C. A. Henry, superintendent of shops, Chicago, Burlington & Quincy. Headquarters, West Burlington, Iowa.

G. O. Huckett, master mechanic, Sterling Division, Chicago, Burlington & Quincy. Headquarters, Sterling, Colo.

E. D. Jackson, division engineer of maintenance of way, Baltimore & Ohio Railroad. Headquarters, Philadelphia, Pa.

W. J. Jackson, division engineer, Minnesota and Dakota Divisions, Chicago & North Western. Headquarters, Winona, Minn.

J. Edgar Johnson, division engineer, Pere Marquette R. R. Headquarters, Saginaw, Mich.

L. Jutton, division engineer, Madison Division, Chicago & North Western. Headquarters, Madison, Wis.

R. G. Knight, roadmaster, Northern Pacific Ry. Headquarters, Staples, Minn.

George C. Koons, assistant engineer maintenance of way in charge of bridges and structures, Pennsylvania Railroad.

C. I. Leiper, principal assistant engineer, Philadelphia, Baltimore & Washington Railroad.

G. W. Lillie, assistant mechanical engineer, Rock Island Lines. Headquarters, Silvis, Ill.

D. A. MacMillan, assistant general air brake inspector, Northern Pacific. Headquarters, St. Paul, Minn.

George S. McKee, superintendent of motive power, San Antonio and Aransas Pass Railroad. Headquarters, San Antonio, Texas.

G. L. Mattice, district engineer, North Railway. Headquarters, Montreal, Que.

F. W. Mellor, architect, New York, New Haven & Hartford R. R.

J. H. Milton, superintendent, car department, Rock Island Lines. Headquarters, Chicago.

Joseph H. Nash, superintendent of motive power, Illinois Central Lines. Headquarters, Chicago.

George Peck, roadmaster, Canadian Pacific. Headquarters, Calgary, Alta.

Frank W. Pfleging, signal engineer, Union Pacific. Headquarters, Omaha, Neb.

C. A. Preston, valuation engineer, Pennsylvania Railroad.

L. J. Putnam, principal assistant engineer, Chicago & North Western. Headquarters, Boone, Iowa.

Joseph T. Richards, consulting engineer maintenance of way, Pennsylvania Railroad.

William J. Ridley, road foreman of engines, Fargo Division, North Pacific. Headquarters, Fargo, N. D.

C. E. Segrest, general mechanical inspector, Louisville & Nashville R. R. Headquarters, Anniston, Ala.

M. E. Thomas, division engineer, East and West Iowa and Iowa and Minnesota divisions, Chicago & North Western. Headquarters, Boone.

A. M. Turner, district engineer in charge of construction, Chicago, St. Louis, Cairo and Michigan divisions, of the Cleveland, Cincinnati, Chicago & St. Louis, and Peoria & Eastern Railway, west. Headquarters, Indianapolis, Ind.

J. E. Willoughby, assistant chief engineer, Atlantic Coast Line. Headquarters, Wilmington, N. C.

Charles Yoder, assistant engineer of track, Lake Shore & Michigan Southern and the Dunkirk, Allegheny Valley & Pittsburgh. Headquarters, Cleveland.

G. A. Ziehlke, signal supervisor, Kansas Division, Union Pacific. Headquarters, Kansas City, Mo.

R. S. Stephens, general purchasing agent, Morgan's Louisiana & Texas and the Louisiana Western Lines.

OBITUARY.

John Clark Cushman, former secretary of the Plymouth, Kankakee & Pacific R. R., now a part of the New York Central system, died at his home in Chicago, June 4th.

Francis E. Ward, former general manager of the Chicago, Burlington & Quincy R. R., died June 6th, at the German Hospital in Chicago. Mr. Ward, who since his resignation as general manager has been doing special work on the staff of the president of the Burlington, was born in Montreal, Que., July 29, 1867. He was educated at the McGill Model School, Montreal, and entered railway service in September, 1881. Until November, 1885, he was apprentice clerk and stenographer in the mechanical department of the Grand Trunk Railway, at Montreal; January, 1886, to December, 1887, secretary to the second vice-president of the St. Paul, Minneapolis & Manitoba Ry. at St. Paul, Minn., and then until November, 1890, secretary and chief clerk to the president and general manager of the Eastern

Digitized by Google

FRANCIS EDWARD WARD.

Ry., of Minnesota. In January, 1891, Mr. Ward became secretary to the president of the Great Northern Ry., and in July, 1894, was appointed assistant to the president of that road and served in that capacity until February, 1898. After holding the position of general superintendent of the Montana Central Ry. from March to October, 1898, he was made general superintendent of the Great Northern Ry., and March 1, 1903, was appointed general manager. He resigned in October, 1907, to accept the same office with the Chicago, Burlington & Quincy R. R. He had been with that company continually since then, although he resigned the office of general manager in August, 1912, and had since that time been engaged in special work for the company.

Robert S. Seibert, president of the East Broad Top Railroad & Coal Company, died at Oak Lane, Pa., May 24th, aged 57 years. He entered railway service in January, 1874, as telegraph operator with the Pennsylvania Railroad. In October he became agent and operator of the East Broad Top and in May, 1877, trainmaster of that road. From November, 1881, to 1886, Mr. Seibert was train dispatcher on the Chicago & Eastern Illinois Railroad; then train dispatcher on the West Shore Railroad, later trainmaster; afterward with the Denver & Rio Grande Railroad, and in October, 1891, was appointed superintendent of the Pueblo Union Depot Company. In 1892 he became general manager of the Nevada Southern, and in 1896, general manager of the California Eastern Railway, of which road in 1900 he became also vice-president. He returned to the East Broad Top as general manager in July, 1903, and since November, 1903, has been president of that company.

Joseph G. Cutler, roadmaster of the Northern Pacific at Walla Walla, Wash., died in the latter city on May 29th, aged 55 years. Mr. Cutler was born at Cambridge, Mass., and was graduated from Lawrence Scientific School at Harvard University. He began railway work in 1881 as rodman for the New York West Shore & Buffalo. He was then with the Canadian Pacific, Boston Hoosic Tunnel & Western and Burlington & Missouri River until 1888, when he was made resident engineer of the Washington & Columbia River. In 1893 he was appointed chief engineer, and in 1895, also treasurer, of that road, and later, when the Northern Pacific acquired the Washington & Columbia River, he was made an assistant superintendent. Subsequently, he became roadmaster of the branch from Pasco to Walla Walla.

LEGAL.

Supreme Court Decisions.—The big event in legal decisions affecting the railways during the month, were those handed down by the Supreme Court in the Minnesota and Southwestern State rate cases. These are discussed more fully in another section of this issue. The possibility of further litigation over the Minnesota rate case is being discussed by attorneys in Minnesota following the discovery that injunctions against the enforcement of the passenger and commodity rates obtained from the United States Circuit Court by stockholders of those railroads after the Sanborn decision in the Great Northern, Northern Pacific and Minneapolis and St. Louis cases, are still enforced. It is likely that the Attorney-General of the State will ask the Circuit Court to enter a decree vacating these injunctions in view of the Supreme Court decision. This, of course, would solve the problem if the roads would consent to such a proceeding without a contest.

It is also unofficially reported that the Ann Arbor and Pere Marquette railroads are planning to attempt to get relief from Michigan's two-cent fare law, and action is likely to be taken in the courts of that State to obtain higher rates.

The Chicago, Milwaukee and St. Paul has filed an appeal in the United States Supreme Court from a decision of the Wisconsin Supreme Court which upheld the Wisconsin law requiring that the upper berth in a sleeping car be kept closed until it is sold. The railroad contends that each car is divided into units of space and in as much as they are compelled by the Interstate Commerce Commission to file a tariff stating the rates for each section of space, they would be violating the law by allowing a traveler to have two units of space for the payment of one. Moreover, it is contended that such a practice would lead to many difficulties among travelers themselves on account of influence being used with porters and conductors.

The Norfolk and Western has appealed to the Supreme Court, from the decree of the Kanawha County Circuit Court of West Virginia, holding constitutional as to this road the two-cent passenger rate law of 1907. The railway claims its net earnings upon the capital invested in the intrastate passenger business in West Virginia will be only 38-100 per cent under the two-cent law.

The Supreme Court holds in the case of the Government against the Baltimore & Ohio Railroad, that Congress had not the authority to require the railroad to raise its bridge at Parkersburg, W. Va. An indictment rested against the railroad for failure to alter its bridge across

Digitized by Google

the Ohio River as ordered by the Secretary of War. The road contended that compliance with such orders was not stipulated in its original franchise from the Government.

The Supreme Court has handed down a decision holding that State Railroad Commissions do not have authority to prescribe rates conflicting with tariffs filed by railroads with the Interstate Commerce Commission on freight designed for export although it is shipped within the State.

The Supreme Court has declared the Oregon law of 1907 granting the State Railroad Commission valid, by sustaining the Commission's order to the Portland Railway, Light and Power Company directing that it reduce by five cents, fares on its Milwaukee and Oregon City interurban divisions.

An appeal has been taken to the United States Supreme Court by a number of railroads operating in Texas in what is known as the Shreveport rate case.

A recent decision was announced by the Commerce Court in which the order of the Interstate Commerce Commission requiring cities, or to increase their rates on similar railroads, to reduce their interstate rates on shipments from Shreveport, La., to Texas consignments between Texas points was upheld.

The Texas Railroad Commission issued an order some time ago providing for a reduction of freight rates throughout the State. The case has resulted in a conflict between the Interstate Commerce Commission and the railway commissioners of Texas.

The Supreme Court adjourned on June 16th until October with some twenty-five important cases left undecided. Among these were the cases of Samuel Gompers, John Mitchell and Frank Morrison, the officers of the American Federation of Labor, who are asking for a review of the decision of the District Court holding them in contempt for alleged violation of an injunction in the Bucks Stove & Range Company case. Execution of the sentences thus will be delayed at least until fall. Gompers, who has been sentenced to a month in jail, has been very ill for several months.

Other cases on the left-over list include the Intermountain rate case, the citrus fruit rate case affecting the Florida East Coast Railway oversea to Key West; the Kentucky and Indiana State rate cases, the Nashville-Atlanta reshipping privilege case, the New York harbor sugar lighterage case and the California oil land suits by individuals against railroads.

Among the State laws whose constitutionality remain undecided are those of New York, giving the right to city officials to tax national bank stocks regardless of debts of the owners; the Georgia law regulating headlights on locomotives; the Kentucky law taxing those who furnish information to commercial rating houses, and the Vermont law taxing saving deposits in national banks.

An Important Mail Carrying Decision.—The United States Court of Claims at Washington, has rendered a decision which lays a foundation for railroad claims amounting to many millions against the Government in connection with the carriage of United States mails. The decision carried with it a judgment of $82.604.84 in favor of the Chicago & Alton Railroad in a suit alleging unfair payment for carrying the mails. The puzzle of weighing the mails underlies the court's ruling.

The Chicago & Alton case applied only to contracts subsequent to June 7, 1907, when Postmaster General Meyer issued an order providing that when the weight of mails was taken on railroad routes the whole number of days included in the weighing period should be used as a divisor for obtaining the daily average.

The court decided that no claims could be made under the inequalities of the old practice, because Congress repeatedly used the terms of the practice in legislation, and thus established it as a long used custom. But the Alton claim was allowed as a just claim to indemnity because Secretary Meyer's order never had been recognized by Congress. It is expected that similar suits will be brought by many other railroads.

Enforcing Anthracite Carriers' Decision.—The Government has taken the final move to make effective the United States Supreme Court decision in the hard coal trust suit, by having the attorney general's office present to Judges Gray, Buffington and McPherson, in the Federal Court of Philadelphia, a decree to enforce the highest mandate cancelling, except in four instances, the so-called 65 per cent contracts under which the coal carrying railroads purchase the product of the independents. The decree, as amended, will not prevent coal companies individually from entering into the 65 per cent contract arrangement with railroads, so long as they are not the result of a concerted plan in restraint of trade.

Suit for Back Taxes Against the Rock Island.—The Polk County, Iowa, tax authorities have filed suit in District Court against the Rock Island for collection of $15,559.400, alleged back taxes, with five per cent interest and 50 per cent statutory penalty, charging illegal suppression of $100,000,000 assets during the past five years, of which one-fourth is assessable under Iowa statutes.

Terminal Railway of St. Louis Wins Case.—The Terminal Railroad of St. Louis won a victory in the Federal District Court of that city on June 16th, when Circuit Judges Sanborn and Smith filed an interlocutory decree instructing the terminal association to file new contracts in accordance with the Supreme Court decision in the ouster suit brought by the government.

The decree does not conform to that submitted by the government, which specifically prohibited the terminal association from levying a bridge toll on traffic entering St. Louis from the east.

The decree directs the terminal association to submit to the court for final approval its contracts with its constituent roads. If these contracts are approved the final decree in the case will be entered.

The Supreme Court decision directed an interlocutory decree to be filed directing the terminal association to reframe its contracts so that all roads would be admitted to the terminal on equal terms.

New Jersey Commuters Win Rate Case.—The Court of Errors and Appeals at Trenton, New Jersey, has upheld the order of the Public Utility Commission requiring the railroads to issue com-

Digitized by Google

mutation tickets between the terminals in Jersey City and vicinity and points within the State. It is expected that the Public Utility commissioners will now undertake the rate investigation demanded by the Commuters' League of New Jersey, which had been held up by the fact that there were no commutation rates between the terminal points adjacent to New York and Philadelphia.

Grand Trunk Western Indicted for Rebating.—The United States Jury at Columbus, Ohio, has returned twenty indictments against the Grand Trunk Western Railway Company charging it with illegal concessions in freight rates between Newark, Ohio, and Battle Creek, Mich. Under the Federal laws, the company is liable to a minimum fine of $1,000 for each alleged violation or $20,000 for all.

The case investigated by the Grand Jury involves the transportation of coal from mines in Belmont County to Battle Creek, Mich.

STATE RAILWAY COMMISSIONS

General.—As might have been expected, the recent decisions by the Supreme Court in the State rate cases have caused a number of State Commissions to become more active and reports are already coming in from many directions of rate regulations that were held up while the Minnesota and Southwestern rate cases were under consideration, but which will be released and put into operation at once now that the State Commissions have been upheld in their authority.

Meanwhile the railways are studying the decision and are inclined to point out that State power may not yet be assured, and that the scope of the decision will not be known until the court hands down its finding in the Shreveport rate case hearings on which have been advanced and set for October 14th.

A new interpretation has been made by the railway interests of the phrase "the State power nevertheless continues until Congress acts, and by its valid interposition limits the exercise of the local authority." Taken first as a declaration that Congress must act before State encroachment on the domain of interstate transportation is checked, these words are now held as possibly signifying far otherwise, taken in the light of other words in the decision.

From Nebraska it is reported the State Commission is preparing to set to work at once on a revision of freight tariffs. A reduction is promised, some reports putting it at from 10 to 15 per cent. Iowa also is preparing to order reductions.

Canada.—The local freight tariff recently filed with the Canadian Railway Commission by the Intercolonial Railway, the Government-owned road covering all points on the government line in New Brunswick and Nova Scotia show some surprising increases. Practically all the rates have been raised with the exception of those between competitive points served by other railways or by water connections. One of the most important changes is the increased minimum rate from 25 to 35 cents. This will mean an extra ten cents on every small shipment. The increased general schedules range from one to eight cents a hundred pounds, which amounts in some cases to as much as twenty-five per cent. A movement for a general advance in rates in Eastern Canadian territory is to follow.

California.—The Railroad Commission has granted the application of the Southern Pacific Company to issue $30,000,000 of two-year notes at five per cent for improvement of and extensions to its lines. A detailed statement of the uses to which the money will be put was submitted with the application. In addition, the company plans to expend during the current fiscal year $10,000,000 from earnings.

Illinois.—The Railroad and Warehouse Commission has issued a statement, that in the future electric lines operating throughout Illinois, will be required to observe a uniform clearance rule.

Lives of both employes and patrons, it is contended, are endangered at present because of narrow clearances at viaducts on various electric roads. These roads have been permitted to follow their own standards and it is desired that a general rule applying to all of them should be adopted. Testimony already has been obtained from a number of experts and it is understood that a formal order will be filed by the Commission within a short time.

Louisiana.—The Railroad Commission has issued an order directing the American, Wells-Fargo and United States Express companies to accept, forward and deliver intra-state express shipments tendered them, by the shortest and most direct route and at the continuous mileage rates established by the Commission in 1911.

Missouri.—It is understood that the Public Service Commission will comply with the request of the railroads that the Commission wait for the report on the physical value of the roads until a valuation board, appointed by the Inter-State Commerce Commission completes its work.

The Commission has received an application from the Chicago, Rock Island & Pacific Railroad for the approval of a proposed issue of $4,400,000 gold notes for equipment purposes.

In a recent ruling the Commission holds that all private car companies operating in Missouri are under the jurisdiction and subject to the regulations imposed by the Commission. This affects a number of companies. The ruling was preliminary to the permit issued to the American Refrigerator Car Transit Company to issue $2,500,000 in gold notes.

Maryland.—The Public Service Commission has signed an order permitting the Baltimore & Ohio Railroad Company to issue stock certificates in the amount of $10,000,000 to be used to provide additional equipment for the road.

Attorneys for the railroad explained that the expenditure is needed for the purchase of 1,822 gondola cars, 8 steel postal cars, 60 mikado-type locomotives and 10 Mallet-type engines. The title of the stock is vested in the Girard Trust Company of Philadelphia. The petition was filed on May 22nd.

The trust certificates will be issued to an amount equal to 90 per cent of the cost of the equipment and delivered to an amount not to

Digitized by Google

exceed $10,000,000. The issue is to be known as the Baltimore and Ohio equipment trust of 1913.

The certificates pay 4½ per cent, and ten per cent will be paid off each year.

New Jersey.—The State Public Utilities Commission has reaffirmed its order, given to the various railroads operating in the State, directing that pure and sufficient drinking water for all passengers shall be carried in each car used for the transportation of men and women.

After the law prohibiting the use of the common drinking cup went into effect the railroads stopped furnishing water for passengers, whereupon complaint was made to the State Utility Board. The latter ordered the Pennsylvania, the Lackawanna, the Erie, the Northern of New Jersey, the Susquehanna, the New Jersey & New York and the West Jersey & Seashore to resume the practice.

The carriers asked for a rehearing, which was granted. The Board has now affirmed its original ruling and ordered that water of proper quality shall be furnished on and after June 23rd. The order says:

"Having reached the conclusion that the provision of drinking water is required in adequate and proper service, the prior practice of the companies must justify the requirements as applicable to all steam passenger trains."

New York.—The Boston and Albany Railroad has made application to the Public Service Commission for approval of an issue of improvement bonds amounting to $2,015,000 payable in 25 years and to bear five per cent interest from July 1, 1913.

The Commission has addressed a lengthy letter to Governor Sulzer urging the embodiment in his message to the special session of the legislature, of a request for an appropriation of not less than $1,200,000 as the State's portion of funds for the elimination of grade crossings on the Atlantic Avenue branch of the Long Island Railroad. The amount requested would permit the expenditure of $4,800,000 immediately as the railroad company is required to spend twice the amount, and the city or county an amount equal to the State's contribution. In other words the expense of eliminating grade crossings, is in the ratio of 25 per cent state money, 25 per cent city or county and 50 per cent money of the company affected.

There is about $20,000,000 worth of such work urgently needed on the tracks of the Long Island Railroad Company, within the confines of the limits of Greater New York; which has been delayed owing to failure of the State appropriating the necessary funds. Applications for appropriations at a special session of the legislature must be made directly by the Governor.

The Commission, Second District, is to make a general investigation into the safety of operation of railroads, within New York State, having special reference to conditions indicated by railroad accidents during the past few years in this and adjoining States. The matter was considered at a meeting, the purpose of the proposed investigation being to "lay the basis for such order or orders as may be warranted by the existing transportation situation and found necessary to the safety of passengers and railroad employes."

Of the 63,988 passenger trains operated by steam railroads in New York State during the month of March, as reported to the Public Service Commission, 81 per cent were on time at the division terminal. The average delay for each late train was 42.0 minutes and for each train run, 8.2 minutes.

Waiting for trains on other divisions continue to cause delays, the record for the month mentioned being 36.4 per cent, and 15.7 was the percentage for delays due to waiting for train connections with other railroads, with 3.0 per cent for engine failures.

For the purpose of completing construction under way and providing for further additions to the company's property, the Delaware & Hudson Railroad Company was authorized by the Public Service Commission to issue $2,000,000 in four per cent bonds.

Ohio.—Permission has been asked from the Public Service Commission by the Pittsburgh, Youngstown & Ashtabula Railroad Company, to issue $640,000 four per cent 40-year bonds at par to pay the Pennsylvania Railroad Company for improvements on the property. The bonds are part of a general mortgage for $15,000,000.

Pennsylvania.—Figures taken from reports to the State Railroad Commission show that during the first quarter of 1913, 279 persons were killed on the railroads of Pennsylvania and 2,885 injured, the fatalities being six less than in the corresponding period of 1912, but the injury list greater by 308. The list of casualties on the railroads shows that no less than 166 of the killed were trespassers and that twenty persons were killed at grade crossings.

The Commission has selected an expert to inquire into the charges levied by the anthracite carrying railroads for the transportation of coal from the hard coal fields to Philadelphia. The Commission some time ago suggested that the complainants and the railroads get together and select a man for the work, the choice to be approved by the State, but no agreement has been reached and the Commission desires to have the work started at an early date. The inquiry is the result of testimony taken by the Commission in Philadelphia last fall, when it was found that not even the railroads were able to produce evidence as to the exact cost of hauling a ton of coal from the mines to Philadelphia.

Texas.—The Texas Grain Dealers' Association will make a fight before the State Railroad Commission for a readjustment of freight rates and transit privileges on grain and grain products.

The application of the St. Louis, Brownsville and Mexico Railroad for approval and registration of $776,236 of bonds has been approved by the Railroad Commission. These bonds cover the branch lines that run from Bloomington to Victoria and from Heyser to Austwell.

The Railroad Commission has adopted a motion made by Earl Mayfield to consider at public hearing on July 9th a proposition to abolish the Galveston differential and to apply straight mileage rates to that port. The proposition is favored by a majority of the Commission.

Wisconsin.—The Railroad Commission has ordered a general reduction of twenty per cent in the rates for transportation of merchandise by express, to go into effect in twenty days. The

Digitized by Google

100-pound basing rates are considerably altered and the graduate scales on which the charges for the various weights are computed are completely changed.

LEGISLATION.

National.—The tariff continues to consume the larger part of the time of the members of both houses of Congress and it would appear that still many months must elapse before it will be whipped into final shape and ready for the President's signature. The measure, which is assuming a more radical form as it nears completion, is causing nation-wide distrust among business interests and is the one big factor in the spirit of unrest which is at present nation-wide in its influence.

At the present writing, the Sundry Civil Appropriation Bill with the exemption of labor organizations and farm associations from anti-trust prosecutions with funds provided by the measure, only requires the President's signature to become a law, and it is generally believed that the chief excutive will sign it, although possibly under protest.

Representatives of important railroad interests appeared before Senator Williams, sub-committee of the Senate Finance Committee, at Washington last month, in an effort to have this committee change Sub-section G of the income tax provision of the Underwood bill which the railroads declare to be unfair and inimical to their interests. The railroad interests were represented by W. D. Hines, of New York, chairman of the executive committee and general counsel of the Atchison, Topeka & Santa Fe. Mr. Hines said: "Under Sub-section G of the income tax assessments are levied both on corporations paying and receiving incomes. This is manifestly unfair and the railroad interests want the corporation paying an income to another corporation freed from assessment.

"It is also provided that the net income of a corporation shall be ascertained by deducting from the gross amount of the income of such corporation interests accrued and paid within the year on its indebtedness to an amount of such indebtedness not exceeding its paid-up capital stock outstanding at the close of the year. This also is manifestly unfair and I am here to ask Senator Williams' sub-committee to make changes as will permit deductions of indebtedness exceeding the entire paid-up capital stock."

Mr. Hines stated that the interests he represented control more than 100,000 miles of railroads and represent nearly a billion dollars invested capital.

An amendment to the Erdman Act backed by the heads of several great systems, the chiefs of principal railroad organizations, the National Civic Federation and others, has been introduced into the United States Senate by Senator Newlands. It is designed to meet the objections to the Erdman law, which were raised in the recent wage dispute between the locomotive firemen and Eastern railroads, by enlarging the Board of Arbitration to six members. The law now provides three. A commissioner of mediation and conciliation would be created, who, with two other Government officials to be appointed by the President, with the ratification of the Senate, would constitute a Board of Mediation and Conciliation. The Board would name disinterested arbitrators to act with arbitrators chosen by employers and employes.

The proposed amendment relies upon voluntary arbitration. While it covers only controversies arising between interstate railroads and their trainmen, both the railroad officials and the Brotherhood officials are willing to have the shopmen included, if the latter wish.

Seth Low, president of the National Civic Federation, made a statement in explanation of the bill.

Simultaneously with the introduction of the bill, Seth Low, president of the National Civic Federation, issued a long statement explaining and advocating the bill.

The result of the Supreme Court decisions in the State rate cases has already become manifest by the preparation of a bill by Representative Willis, of Ohio, a Republican member of the House, Interstate and Foreign Commerce Committee, which has for its purpose the extension of the Interstate Commerce Commission's control over intrastate rates on interstate railroads.

The basic principle of this measure will be the right of Congress to control absolutely the instrumentalities of interstate commerce, even to the extent of regulating the rates in each State. Such is Representative Willis' interpretation of what the Supreme Court of the United States held in the Minnesota rate cases to be within the power of Congress.

It is, however, generally conceded in Congress at the present time, that no legislation of this character can be obtained except after a long campaign of education. Representative Willis' bill is intended as an opening wedge.

A bill has also been introduced by Senator Lewis, of Illinois, to give the Interstate Commerce Commission control over all issues of stock by railroads or other common carriers. This bill would require the railroads to make a satisfactory showing of value to justify any increase in issue of securities.

Senator Smith, of South Carolina, has introduced a bill providing that railway and steamship lines engaged in interstate business shall be compelled to provide hereafter separate sleeping accommodations for passengers of different races.

This is the application of the Jim Crow laws existing in the various States of the South and Southwest to the sleeping car business which is broadly speaking, altogether interstate business.

Senator La Follette has introduced the most drastic amendments ever proposed to the Sherman anti-trust law. The Wisconsin Senator's measure discards all generalities and in definite and specific terms defines what restraint of trade is; what shall be interpreted as restraint of trade and how it shall be determined by the Federal Courts. At the same time the bill practically wipes out the "rule of reason" which the United States Supreme Court read into the law when the famous Standard Oil and Tobacco Trust cases were settled.

The Senate Territories Committee has agreed upon a bill for Government construction of railroads in Alaska. It provides for $40,000,000 in bonds to finance the undertaking and leave entire control to the President. The committee decided against the plan of Senator Jones for a commission of five members to supervise the construction.

Digitized by Google

Senator Chamberlain said the President had expressed himself as in sympathy with the proposed Alaskan legislation, but had not yet agreed to recommend its consideration in the present session while tariff and currency reforms are still undisposed of.

Connecticut.—The Connecticut House of Representatives has concurred with the Senate in passing an optional workmen's compensation bill. It will be signed by the Governor, as with one exception, only those amendments suggested by him were accepted by the committee after reporting the measure to the General Assembly.

The bill applies to employers of five or more persons, excluding casual labor. The common law defenses are swept away, in event of litigation, to the party in interest who has refused to accept the compensation law.

Adjustments of compensation for death or injuries go to commissioners, of whom there is one for each Congressional district. The minimum compensation for injuries is $5 a week and the maximum $10. Dependency is taken care of, and compensation for disabilities is based on tables of liability companies.

The bill will be effective so far as organizing the commission is concerned on October 1st, while in its entirety it will be law on January 1st next.

Massachusetts.—The House of Representatives has passed the Washburn Bill over Governor Foss' veto. The measure extends the credit of Massachusetts railroads and increases the size and power of the railroad commission. The Senate also passed the Washburn Bill over the Governor's veto by a vote of 33 to 3. The bill is now a law.

Missouri.—Railroads have already obtained a sufficient number of signatures to assure the submission of the "full crew" law, enacted by the last legislature, to a referendum at the next general election. It is expected that the railroad's petition will contain double the number of signatures required by the Missouri constitution when filed with the Secretary of State.

The referendum petition will prevent the "full crew" law from becoming operative until the next general election in Missouri, November 3, 1914, at least. The law was to have become effective June 22nd.

New York.—Governor Sulzer has vetoed one of the two Cullen bills, desired by President John Purrby Mitchel, of the New York City Board of Aldermen but opposed by the barge canal interests, which would permit railroad corporations to own terminal companies. The bill was in the interest of the development of terminal facilities on the west water front of New York City. The companion bill, which permits the development of the South Brooklyn waterfront including the Bush Terminal property, was signed by the governor some days ago.

Pennsylvania.—The Senate has finally passed the House bill taxing anthracite coal 2½ per cent on the value of each ton at the mines, or approximately five cents on a ton. It is estimated that if the bill becomes a law the revenue derived will be about five million dollars, of which half will go to the nine anthracite counties in which the tax is levied and the other half will go into the general fund of the State.

Oklahoma.—The legislature of Oklahoma recently passed a "full crew" bill which Governor Cruce vetoed. The governor's message accompanying his veto is in part as follows:

"I have studied the bill from every angle and the more I have studied it, the more I have become convinced that it should not receive my approval. In the enactment of this bill, it is only the railway companies and their employes that have been considered. The thousands of people in this State who travel upon the railroads and ship their products and merchandise over same have not entered into the discussion.

"This fact, however, must remain, after all has been said, that every dollar of expense placed upon railway corporations in Oklahoma will ultimately be paid by those who patronize the railroads. The cost of putting this bill into operation is estimated by the corporation commission at something like $250,000, while the cost is estimated by the railroad companies at more than $400,000. Whether it be $100,000 or $500,000 that amount in the end will be paid by those who use the railroads.

"Another thing I have learned to believe is that those who have made a lifetime study of railroad operations are better judges of the proper method of operating them than I am and I believe that this is equally true when applied to a majority of the members of any legislative body."

An active campaign has been started in Oklahoma to secure the adoption at the polls, of section 9 article 9 of the Constitution, which will permit railroads to merge. The amendment is to be voted on at a special election to be held August 5th, and the proposed change has the endorsement of the State Corporation Commission. This will make the fourth time that the people have voted upon the change.

TRAFFIC.

General Developments.—General traffic conditions in the West, so far as the railways are concerned, continue extremely favorable and in the majority of instances, show loadings far in excess of previous years. Indications point to large grain crops, and the roads are generally busy getting their equipment in order to meet the pressure which will be brought to bear as soon as these crops begin to move. Coal is also moving freely and the iron ore tonnage on the Great Lakes is extremely heavy. Add to this, that the latest export figures show a record movement and that immigration was never heavier, and it is plain why the railways, at the present time, are not complaining of a diminution in traffic movements. In fact roads in all sections are reporting more than an average business, and the movement of loaded cars has seldom, if ever, been exceeded at this season. Substantial gains have been made over last year in grain, coal and miscellaneous freight, although merchandise traffic, at the present time, is disappointing, and shows the effect of the hesitancy in business caused by the influence of tariff developments at Washington. With the harvesting of the big grain crops, however, and the stimulation this

Digitized by Google

will give to trade in all its ramifications, it is confidently predicted that the business hesitancy is likely to decrease as Fall advances and that merchandise traffic will see a distinct improvement.

The railroads have a real problem to face in meeting the traffic conditions of the Fall. Already, in a few sections, there is noticeable some scarcity in box cars and the coal car situation is one which is causing those who appreciate the outlook, to wonder what the situation will be in the course of the next few months. Railroads have already begun to accumulate cars in the southwest to take care of the movement of the new grain, and complaints from other sections are to be expected more or less, from now on.

Western railway officials generally, take an optimistic view of future developments, so far as traffic is concerned. Their personal investigations, almost without exception, have shown the grain crops to be in good condition and the acreage planted large. While they recognize a certain amount of caution in business activities, it is appreciated that this condition is likely to improve as the result of an increase in general prosperity in agricultural sections.

Record May Exports.—According to a statement issued by the Bureau of Foreign and Domestic Commerce, Department of Commerce, the exports of the United States in May exceeded by nearly $20,000,000 the high record total for May of any earlier year, being $194,593,071 against $175,380,058, the highest record for that month in any earlier year.

Imports during May showed a marked decline being $133,466,450, against $155,697,886 in May last year, the high record for that month in any preceding year, but exceeding May imports in any year except 1912.

Government Crop Estimates.—As was generally expected, the Government crop report of last month showed deterioration in the leading winter wheat States. The report also showed, however, that in spite of this deterioration caused by hot winds and dry weather, the latter part of May, the total yield would probably be one of the largest produced. The yield of winter wheat to June 1st is placed at 492,000,000 bushels against approximately 400,000,000 harvested last year. Spring wheat acreage has also reduced somewhat, although the condition of the crop is about equal to the average. This promises a crop of about 252,000,000 bushels against one of 330,000,000 for last year, although it should be remembered that the estimate a year ago was only 265,000,000 bushels. The acreage in oats, according to this latest report, shows a remarkable increase, being 38,341,000 acres against 37,916,000 planted last year.

Cotton Acreage Estimate.—Government's next cotton acreage report is not due until July 3rd at noon, but meanwhile estimates of larger acreage are being made from private sources, which indicate that this may be a season of a new maximum. The "Financial Chronicle's" estimate just published, of 38,573,441 acres for the season, or 3.20 per cent larger than its estimated acreage of 1912, exceeds any other private estimate this season. The "Chronicle's" acreage estimate last year of 37,377,000 acres was 2,611,000 acres larger than the Agricultural Department's estimate of area in cultivation at the end of June, 1912. This official total was 34,766,000 acres. Other private forecasts have ranged from three per cent to seven per cent increase on the latter basis.

May Anthracite Production.—The anthracite trade in May was in a flourishing condition. Nearly 6,000,000 of tons of coal were mined, more than 6,000,000 of tons were consumed, and the coal was sold at practically full prices. This was a great month's business. In May of last year the mines were closed about two-thirds of the month pending the wage settlement, and the total production of coal in that month was but 1,429,000 tons. At the close of May, 1912, after nearly two months of strike the loss in tonnage, as compared with the first five months of 1911, was 9,188,893 tons. This year the production in May shows an increase of 4,566,385 tons over last year, and for five months an increase of 8,976,474 tons. From this time on the production of anthracite coal will compare, until the end of the calendar year, with the largest output ever reported.

Lake Commerce Increases.—The statistical report of lake commerce through the canals at Sault Ste. Marie, Michigan and Ontario for the month of May shows an increase of 27 per cent over the corresponding month of 1912, as shown by the following official report:

EAST BOUND.

Articles.	1913. Total.	1912. Total.

Total freight, short tons	11,376,195	8,936,693

Immigration During April.—According to the monthly bulletin of the Bureau of Immigration, there was admitted into this country in the month of April a total of 136,371 aliens, against 96,958 in March, and 99,839 in April, 1912. This month's total was the largest of any single month since March, 1910. Immigration of aliens for a series of months, compared with previous years, follows. The appended table is republished from these columns of yesterday for reference:

	1913.	1912.	1911.	1910.
April	136,371	99,371	98,036	135,544
March	96,958	91,185	81,687	136,745

May	113,635	95,361	133,544	133,544

Heavy Ore Shipments.—The shipment of ore the past month exceeded those of any previous month in the history of the ore traffic. The movement of Lake Superior ore by water amounted to 7,284,212 tons and the total movement to June 1st, was 8,150,599 tons. Shipments to June 1st were on the basis of 49 million tons at least. Those who are close to the iron ore traffic here believe that June shipments will total 8,000,000 tons during 1912. The Shipments during June, July, August and September averaged better than 7,550,000 tons a month. The highest figures that have been predicted for the season of 1913 have been 50,000,000 tons.

Western Passenger Association Fixes Convention Fares.—In pursuance of a policy agreed upon some time ago, railroads connected with the Western Passenger Association, have decided to charge a uniform fare of two cents a mile in each direction to conventions in western territory this year. A rule also was adopted providing for the publishing of a notice in passenger tariffs that railroads will not grant a refund for lost or stolen tickets except in cases where a satisfactory showing is made that such tickets have not been used.

Statement of Car Surplusses and Shortages.—The latest statement of the American Railway Association on the car movements of the country, shows that on June 14th, there was a total surplus of 71,126 cars as compared with a surplus of 60,291 cars on May 31, 1913 and 73,464 cars on June 20, 1912. Compared with the preceding period there is an increase in the total surplus of 10,835 cars of which 9,331 were box cars, 100 flat cars and 1,907 miscellaneous cars. There was also a decrease of 503 in coal car surplus. The total shortage on June 14th, was 7,199 cars as compared with 9,383 on May 31st, and 5,746 on June 20, 1912.

Demurrage Charges Altered.—The American Railway Association has adopted the report of its committee recommending changes in the association's rules regarding per diem and demurrage charges.

The change made in the per diem rate regulation raises the charge from flat rate of 45 cents per day the year round to one of 45 cents per car day during the months from March to August inclusive and a rate of 75 cents per car day during the months of September to February, inclusive.

The flat demurrage charge the year round has been $1 per car day after expiration of the free time allowed. The amendment to this rule calls for the charge of $1 per car day after the expiration of free time for the months of March to August inclusive and the charge of $2 per car day during the months of September to February inclusive.

Livestock in Transit.—In connection with the enforcement of the 28-hour law the Bureau of Animal Industry has made investigation of feeding, watering and resting of cattle, sheep, swine and other animals while in the course of interstate transportation. The results of this investigation and the conclusions based thereon have been announced indicating the views of the department of agriculture as to the minimum requirements of the law as follows:

"The amount of feed which should be given to different classes of animals varies with the length of time between feedings and the weights of the animals. For each twenty-four hours the ration for horses and cattle should not be less than 1¼ pounds of hay to each hundredweight of animal; for sheep, not less than 1½ pounds of hay to each hundredweight of animal, and for hogs, not less than one pound of shelled corn, or its equivalent in ear corn or other grain, to each hundredweight of animal, or periods greater or less than twenty-four hours the ration should be greater or less, respectively, in the same proportion.

"The only practicable methods for railroads to transport animals, other than hogs, without unloading during each period prescribed by the statute for rest, water and feeding, are in 'palace' or similar stock cars and with emigrant outfits. There are cases in which exceptional facilities complying with the law make unloading unnecessary; for instance, specially equipped cars conveying show animals and blooded stock."

Increased Efficiency on the 'Frisco.—The following summary of the operating statistics for the St. Louis & San Francisco Railroad, the St. Louis & San Francisco Railroad of Texas, Fort Worth & Rio Grande, Paris & Great Northern and Brownwood North and South, for the year ending June 30, 1912, as compared with the year ending June 30, 1905, will be of interest to all in the service.

A thirty per cent. increase in freight traffic (net and gross ton miles of revenue freight) per mile of line handled as compared with a "decrease" of eight per cent. in train miles.

Gross earnings per freight train mile increased 29.5 per cent., although earnings per ton mile increased less than one per cent.

The gain noted in the above paragraph is the direct result of the increased efficiency in operation referred to in the first paragraph.

A further striking illustration of the increased efficiency which is being attained on these lines is the showing of increased utilization of motive power. The potential tractive effort per locomotive increased 13 per cent. in the seven years since 1905 while the average train hauled a load 32 per cent. greater in 1912, than in 1905.

Credit Notice.

IN the May issue of the "Railway World," there appeared an article descriptive of the railway terminals at Port Arthur and of railway developments in Canada during 1912. This material was procured through the courtesy of the "Canadian Railway" and "Marine World." to whom credit should have been given for its employment.

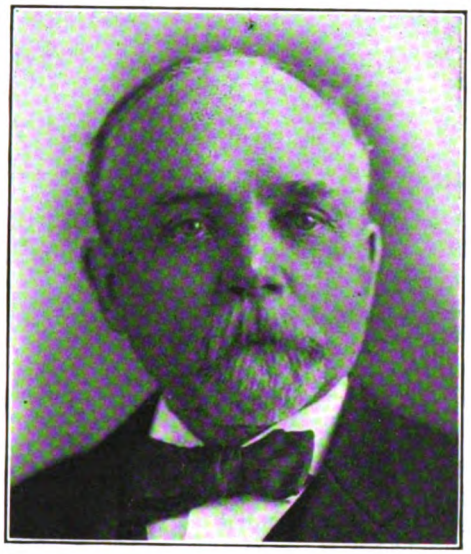
VOL. LVII. AUGUST, 1913 No. 8

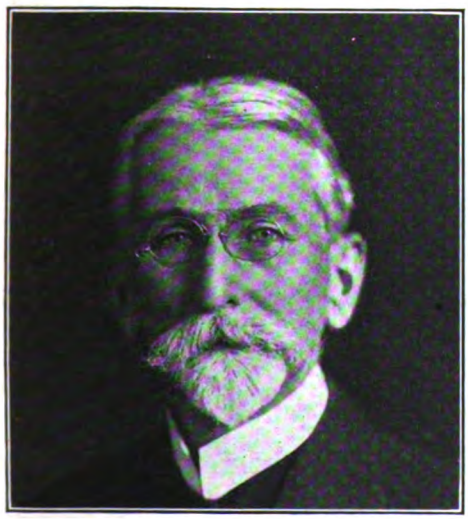
Important Developments in the Transportation Field

ARBITRATING THE WAGE QUESTION

The threatened strike of the railway trainmen took its usual course of preliminary conference, presentation of demands, refusal of demands, taking a strike vote, authorization of a strike, appeal to the political powers, and final reference of the controversy to arbitration. Congress in this emergency acted with commendable promptness. Both parties to railway labor controversies have long been dissatisfied with the arbitration provisions of the Erdman Act. The board established by this Act, in the opinion of the railroad representatives, always took too much from them while the labor representatives declared that it did not go far enough. Under the law there has been created the United States Board of Mediation and Conciliation, to consist of a federal commissioner of mediation and conciliation, and two other officials of the Government to be designated by the president. This Board, upon appeal from either party, can intervene in a railway labor dispute, and will first use its best efforts by mediation and conciliation to bring the opposing parties to an agreement. If this attempt is unsuccessful, the Board will attempt to induce the parties to submit their controversies to arbitration, and if this course is accepted special boards of either three or six mediators will be chosen by the railroads and their employes. The Board is superior to the machinery provided by the Erdman Act, in that it is an impartial tribunal, permanent in character and, supposedly, not swayed by preferences and prejudices for either side, whereas under the Erdman Act the final decision was placed in the hands of one man.



MARTIN A. KNAPP,
Presiding Judge of the Commerce Court, who has been appointed a member of the Board.



WILLIAM L. CHAMBERS,
who has been appointed Chief Commissioner of the Board of Mediation and Conciliation.

Under the law for which Senator Newlands, of Nevada, stood sponsor, the mediation board will act as the unit and furthermore will have no work of arbitration,—no final decisions to make. Its only function,, as its name implies, is to mediate and conciliate, and if mediation and conciliation fails, it co-operates with the contending parties to establish an arbitration board of three or six members, as occasion requires.

Nothing is more certain than that if the board uses its really great power, and the prestige which its permanent constitution and the high purpose which it was appointed to serve, the arbitration provisions of the

G. W. W. HANGER,

Who has been made Mr. Chambers assistant on the Board of Mediation and Conciliation.

Act will not be often resorted to. Under the name of a Board of Conciliation and Mediation the tribunal established by the Erdman Act is, in fact, a permanent tribunal of arbitration before which railways and railway employes must present their case, and whose findings and recommendations, although they will not have the force of law, and although the parties to the various controversies will not have previously agreed to abide by these suggestions, will in time come to be backed up by the irresistible force of public opinion, before whom the strongest corporation and the most arrogant labor organizations must alike bow in submission.

The personnel of the new Board commands confidence. The chief commissioner is Judge William L. Chambers, of the District of Columbia, with G. W. W. Hanger as his assistant, Judge Martin A. Knapp, of the United States Commerce Court, and Royal Meeker, of the Bureau of Labor Statistics. No fault can be found with the selection of Judges Chambers and Knapp, although the order might properly have been reversed. Both are men of judicial temperament who have had considerable experience, especially Judge Knapp, in the settlement of labor difficulties.

Immediately after the appointment of the Board of Mediation and Conciliation, the Conference Committee of Railway Managers indicated their willingness to leave with the Board the decision as to which questions are to be submitted for arbitration. It had first been feared that the railroads would insist on the submission of a list of eight proposed changes in existing rates of pay and working conditions, in addition to the 18 demands made by the employes. It is believed also, although no definite statement to this effect is contained in the official communications, that the railroads, when final stand came, were al- decision, even if it rules out all but the trainmen's demands.

An indication of the attitude of railroad officials toward the new law is contained in an interview with President Willard, of the Baltimore and Ohio, in which he said:

> The Newlands-Clayton amendment to the Erdman Act met with the approval of the labor leaders and railroad executives, and with some amendments which were discussed and agreed to appeared to meet with the approval of those who attended the conference.
>
> The suggestion of the railroads in conducting the negotiations with the labor organizations during the various movements for increased wages in recent years has been that while the Erdman Act now in force was passed with a view to avoiding differences between employer and employe, it did not provide sufficient representation for the third party in interest—namely, the public. This the Newlands-Clayton Act will accomplish.

The appointment of the Board of Mediation and Conciliation is, we hope, the first step in securing fair treatment for the railroads in these labor controversies. Up to this point the railroads have always lost because their directors would not take the re-

ELISHA LEE,
Assistant to the Manager of the Pennsylvania Railroad, who will present the Railroad's side of the question before the Board of Mediation and Conciliation.

sponsibility, which the labor leaders were always willing to assume, of inflicting an infinite amount of loss, suffering and damage upon the country by allowing a strike to be called. No matter how exorbitant and grossly unjust the demands of railway labor might be—and they have nearly always merited this characterization—the roads, when final stand came, were always forced by a sense of public duty and responsibility for the interests of the nation, to concede the point of arbitration. Out of arbitration the men, in nearly all cases, gained perhaps not what they asked for, but usually more than they expected. Take, for example, the present controversy. The conductors and trainmen employed by the railroads in Official Classification territory have asked for increases in pay of $17,000,000, in spite of the fact that they received increases of $30,000,000 in 1910, an advance of 50 per cent over the rates of wages which they were formerly receiving. As the railroads show in their public statement, if the increases now asked for by the trainmen and conductors were granted, including the additions made to the pay of engineers and firemen, in three years the increases in the compensation of railway labor in this territory would amount to $52,000,000 per annum, which is equivalent to placing on these properties a lien of $1,040,000,000 of five per cent securities, having preference over first mortgage bonds. The situation indicated by these ever-recurring and increasing demands is intolerable. No limit is presented to the demands of railway labor save the operating expenses of the railroads. Up to this point, if public opinion does not interfere, they can press their demand. It is true that long before this point was reached public opinion would interfere, and would save the railroads from bankruptcy. It is not so certain, however, that if the destroying force of the railway brotherhoods is not checked that serious reductions in dividends can be prevented, and it is certain that unless the share of railway labor in railway earnings is kept within reasonable bounds, the quality of service performed by the railroads for the public will seriously suffer. It is not without significance that many prominent capitalists are withdrawing from railway securities, and putting their money into real estate or manufacturing enterprise. Until the problem of railway labor is settled, we do not hesitate to say that the position of railway investments, looked at as a whole, is by no means secure. The present low prices which standard railway securities are selling reflects more than anything else the mistrust on the part of investors as to the share which railway labor will take out of railway profits.

It is not to be thought of that this situation should endure. The permanent welfare and the future prosperity of the American people are bound up in its satisfactory solution. No one denies that railway labor

Digitized by Google

WILLIAM B. WILSON,
Commissioner of Labor who failed in an effort to place the head of the new board under the control of the Department of Labor.

who are conversant with the facts know is entitled to fair compensation. Those that the compensation of railway labor, measured by any standard which may be chosen, cost of living, wages in similar occupations, amount of preparation required and severity of employment, is already more than liberal. The leaders of organized railway labor are, of course, not satisfied with their past achievements. The higher they can force wages and the more they can modify hours of labor and working conditions in the interest of those whom they represent, the greater is the prestige which they enjoy and the more secure their position. In every controversy they know they march to certain victory. They know and their antagonist knows that he is beaten before a shot is fired. It is almost too much to expect of poor human nature to look for moderation in the demands of railway labor under these circumstances. It is time that the public interest in this controversy should be asserted. The public interest is being sacrificed and public welfare is being jeopardized by its continuance. Aside from the paralysis of railway enterprise and the inability of the railroads to give the best service with their present facilities, both of which are traceable, in large measure, to the uncertainty of the railway labor situation, there is ever present danger which a wrong move on the part of either contestant might convert into a terrible reality of a general railway strike. In the old fable, the false cry of "Wolf, wolf," was always raised, but eventually, it will be remembered, the wolf came. So in the railway labor situation. The cry of "strike" has been so often brought forward with its dreadful implication, that it has largely ceased to terrify. Eventually, however, if no peaceable method of solution can be discovered, the railroads will be forced to fight, and when that time comes the country must pay the penalty.

In our opinion, the way to a permanent solution of the railway labor problem has been opened by the appointment of this permanent tribunal. For the first time the interests of the public have permanent and authoritative representation. The claims of the parties in controversy can for the first time be judicially reviewed. The recommendation and findings of this board, especially as its authority and prestige grows with the experience of its members, will have extraordinary influence in formulating public opinion, hitherto uninformed in these matters. It is not too much to hope that out of the deliberation of this tribunal will come the establishment of a standard by which railway wages can be determined, which will be fair to both parties.

FINAL DISSOLUTION PLANS OF HARRIMAN MERGER

The Union Pacific-Southern Pacific dissolution plan has been finally approved. The leading features of the plan are as follows, as embodied in the decree of the Circuit Court: First, 382,924 shares of Southern Pacific stock are exchanged for 425,472 shares of Baltimore and Ohio stock owned by the Pennsylvania Railroad Company. Second, the Central Trust Company of New York, as trustee, is made a party to the plan and is appointed to receive and hold as the depositary of the court, subject to the provisions of the decree, all shares of Southern Pacific stock which may be transferred to it under the plan. Third, the shares of Southern Pacific now held by the Oregon Short Line, remaining after the above exchange with the Pennsylvania is consummated, namely 883,576 shares, are to be transferred to the trustee and registered in its name on the books of the Southern Pacific Company, the trustee shall collect all dividends accruing on this stock. Fourth, prior to November 1, 1913, the Union Pacific and the Oregon Short Line shall offer to the preferred and common stockholders of the former the right to subscribe for certificates of interest issued by the trustee in

Digitized by Google

the Southern Pacific shares held by the trustee, substantially in the proportion of their respective holdings. The price and other terms shall be prescribed by the Union Pacific, subject to the approval of the court. Neither the Union Pacific, the Oregon Short Line, nor any corporation controlled by either, nor any person acting in the interest of either, is allowed to acquire any of these certificates. Fifth, the voting power of the stock is transferred by proxy issued on demand to the trustees to the holders of the certificates, provided such holder shall make affidavit that he is not the holder of any shares in the Union Pacific Railroad Company. The trustee shall collect the dividends on Southern Pacific stock and distribute these pro rata to the holders of the certificates.

This plan has met with general approval. We have already commented on the part which the Pennsylvania Railroad took in the matter. Its offer was dictated solely by considerations of public interest. It exchanged one investment for another of equal value, and it removes possible objection to the holding of the first investment on the part of the Department of Justice. As the Attorney General said in his statement commending the plan to the consideration of the court:

> Moreover it divests the Pennsylvania Railroad Company of a large amount of capital stock of an active competitor—the Baltimore and Ohio Railroad Company—and thereby remedies a highly objectionable condition. So far as I am able to ascertain, such exchange would not result in creating any new combination in restraint of trade nor any other condition in violation of existing law. Should the exchange be made, the Union Pacific Railroad Company would then own 38.66 per cent of the capital stock of the Baltimore and Ohio Railroad Company and the Pennsylvania Railroad Company would own 14 per cent of the capital stock of the Southern Pacific Company.

The plan of trusteeing the stock and barring all voting rights to holders of trust certificates who were also holders of Union Pacific stock is admirable in its simplicity. The Attorney General said:

> These provisions put the disposition of such shares under the direction of the Court. The proposal is to transfer them to a trust company, which shall become a party to the proceeding and in effect an arm of the Court. The trustee has no power to vote the shares except when and as directed by the Court. Union Pacific stockholders will be entitled to subscribe for certificates of interest issued by the trust company representing the shares in its custody, payment to be made either in full at the time of subscription or $25 per share then and the remainder within twelve months with interest at six per cent. But the holders will have no voting rights and will receive no dividends until their certificates are converted into stock of the Southern Pacific Company and such conversion can only be made upon affidavit that the applicant owns no shares of the Union Pacific Railroad Company and is not acting for or on behalf of any stockholders thereof or in concert agreement or understanding with any other person, firm or corporation for the control of the Southern Pacific Company in the interest of the Union Pacific Railway Company, but in his own behalf in good faith. Further, the holders of such certificates can receive no interest on the dividends collected and held by the trustee.

JAMES MCREYNOLDS,
Attorney General of the United States.

The amount of trust certificates to be offered, $88,000,000, may not all be put out at once but will probably be placed at intervals during the two and one-half years which is given to the Trust Company to dispose of it. Nothing but favorable comment has been heard in reference to the plan. Those familiar with the affairs of the Harriman lines do not feel apprehensive that the Union Pacific and Southern Pacific will, under separate control, affect unfavorably each other's earnings. The Union Pacific, in particular, will profit by the transaction, since it will be placed in control of probably $100,000,000 with which to realize the ambitious plan for the extension and improvement of its lines which have been formed by the management. Mr. Julius Kruttschnitt, chairman of the Southern Pacific Company, in denying a report that the Southern Pacific is prepared to open its fight for business with the Union Pacific emphatically denied the rumor. He said:

Digitized by Google

"You must remember that the routing of business by the railroads depends very largely upon its geographical position. If you will consult the railroad map you will note that in Southern California there is a large amount of business which naturally moves over the Sunset lines rather than up to San Francisco and over the Union Pacific. At the same time in the northern part of California there is a certain amount of business which naturally has its outlet over the Central Pacific and Union lines. To-day shippers decide very largely which way their freight shall be carried, and it would be a rather difficult matter to exert very much influence with them with regard to the routing of their products.

"It is hardly natural to expect that the Southern Pacific would attempt to divert business from the Central Pacific, which road is now controlled by it and which has the Western Pacific as a competitor. I desire to state that there will be no change in this respect, but that business which has a natural outlet over the Central will be shipped over that road, while that in the lower part of California having a natural outlet over the Sunset lines will be consigned to that portion of the system for shipment to the East.

"I do not expect that the unmerging of the Union and Southern Pacific will have much effect on the earnings of the Southern. The company's business has reached such large proportions that nothing short of the most unusual developments will have any appreciable effect on the road's earnings. I might liken the company to a wave striking the Imperator, the inertia being too great for it to have much effect on the boat. Take for instance the destruction of the orange crop in California, together with the destruction of the cane crop in Louisiana, both of which figured in the operations of the company for the twelve months ended June 30 last. These two developments naturally cost the company the loss of a very large tonnage and earnings, but you will note that earnings for the year exhibited very large increases in both gross and net."

THE FREIGHT RATE INVESTIGATION

The Interstate Commerce Commission has issued an amended order providing for an investigation into the proposed increase of freight rates by the Eastern railroad. An inquiry is ordered into the following points:

Do the present rates of transportation yield adequate revenues to common carriers by railroad operating in official classification territory?

If not, what general course may carriers pursue to meet the situation?

It is further ordered, that in the prosecution of this inquiry, opportunity shall be afforded to interested carriers and to the public generally to prevent such facts and arguments as may be desired; that common carriers by railroad operating in official classification territory are hereby made parties to this proceeding and shall be served with notice thereof and that subsequent notices shall be given to them and to the public generally of such hearings as may be had.

The Commission is of the opinion "from a consideration of the allegations of the petition, that the need of and justification for additional revenue should be at the present time further examined." The decision to investigate was not unanimous but was carried by a bare majority, and in connection with the issuance of the order the Commission makes the following significant observations:

(1) The fact that we have decided further to investigate this subject must not be taken as an intimation that the Commission has reached the conclusion that revenues are inadequate or that rates should be advanced. Upon this question no opinion has been formed.

(2) That the statute gives to any party the right to attack by complaint any rate, and no general conclusion which the Commission may reach and announce in this investigation can affect that right.

In spite of the guarded and qualified language of the order, the railroads have won a distinct victory. As the RAILWAY WORLD brought out in a special article upon this subject, measured by the standards set up in the former investigation, the railroads in Official Classification territory are plainly entitled to a substantial increase in rates. Moreover, public sentiment upon this matter of rate increases is much better informed than two years ago and is consequently much more favorable to the railroads. For example, Mr. J. Ogden Armour, whose concern is one of the largest shippers in the United States, states the opinion of the large and enlightened shippers as follows:

All rates on railroads should be increased and at once. They are far too low for the investors to get a fair return for their investment, and increases in the rates would result in an immediate improvement in all branches of trade and commerce.

Everybody should be willing to have the rates raised, when all would find improvement and everybody would profit thereby. There is too much interference in this country by the Government in the manner in which the railroads conduct their business and the rates for the carriage of all sorts of freight are far too low. I, as a ship-

Digitized by Google

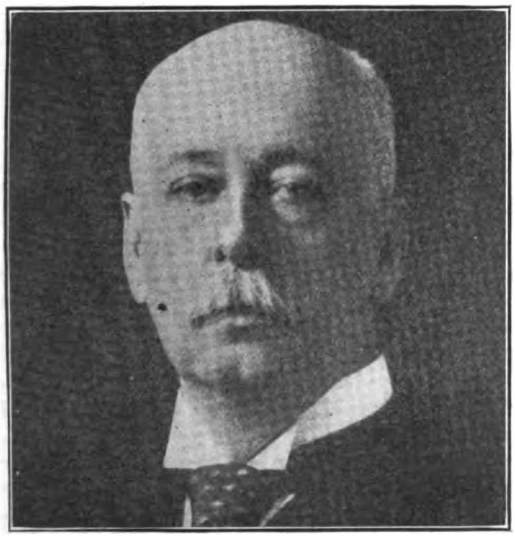
per, would like to see the rates increased and all men of business ought to feel that way.

The railroads need not, we think, have any fear of the outcome of such an investigation. Their position is very plain. They are willing to spend large sums of money in enlarging their facilities and improving their service, in other words, in increasing their service to the public as common carriers. They ask, however, that the public, which is to derive nearly all the benefit from this expenditure, shall through its representative, the Interstate Commerce Commission, allow them to make the very moderate increase in rates which is necessary in order that revenues may be raised to the point which will permit the financing of these extensions by the sale of the necessary amount of security. Presented in this manner, and the case of the railroads will be so presented before the Interstate Commerce Commission, it is, in our opinion, improbable that the petition of the railroads will be denied.

THE COMMISSION'S REPORT ON THE NEW HAVEN

As was expected the investigation of the New Haven by the Interstate Commerce Commission severely condemned the management of that company. The conclusion reached by the investigation which was conducted under the direction of Commissioner Prouty, is as follows:

The "Outside" financial management wasteful in extreme.



CHARLES S. MELLEN,
the retiring president of the New Haven System.

HOWARD ELLIOTT,
Who leaves the presidency of the Great Northern to become the Chief Executive of the New Haven System.

Could have paid 8 per cent in 1912.

Agreement with Boston and Albany should be cancelled.

New Haven should divest itself of its trolley lines.

Boston and Maine's merger with New Haven, if permitted, will result in monopoly in New England.

Passenger train service of both roads better than any other line's entering New York.

Boston and Maine's freight service less reliable than Pennsylvania's or Baltimore and Ohio's.

Passenger fares in New England more favorable to local public than in any other part of the United States.

New Haven management must act prudently within the letter and spirit of the law to better railroad conditions in New England.

Of especial interest is the Commissioner's comment on the outside financial operation of the New Haven. The report says that $204,000,000 was in nine years spent in operations outside the sphere of railroad transportation. Most of these expenditures have not as yet proven profitable.

Our general conclusion is that the outside financial operations of the New Haven Company for the last nine years have been wasteful in the extreme and that the methods by which those operations have been conducted are unnecessarily involved and complex. The reason for this is as apparent as the fact itself. The present management of that company started out with the purpose of controlling the transportation facilities of New England. In the accomplishment of this purpose it bought what must be had and paid what must be paid. To this purpose and its attempted execution can be traced every one of these financial misfortunes and derelictions.

It seems proper to add that while the financial operations of this company have resulted in

Digitized by Google

heavy losses, there is nothing to indicate that its solvency has been impaired. The company has expended in the last nine years upon its road and equipment over $50,000 a mile, a sum almost equal to the average capitalization of the railroads of the United States at the beginning of that period. While this expenditure has been made with a free hand, there is nothing to show that it has not been wisely made and much to indicate that the result has fully justified the outlay. The outside properties of the New Haven have been acquired at extravagant prices. They are for the most part of substantial value, and in many instances are a kind of property the value of which should improve. The financial condition of the company calls for careful consideration and prudent action, but gives no occasion for hysteria.

On the general question of the alleged inefficiency of the freight and passenger service rendered by the New Haven and the Boston and Maine, the report is by no means so positive in condemnation. The passenger service of both lines are approved, and Commissioner Prouty says that New England should be well satisfied, on the whole, with the passenger performance of these lines under investigation. The freight service rendered by both companies, especially the Boston and Maine, is condemned, largely on account of slow movement of traffic. The report contains, however, the following significant passage which explains, in part at least, the inability of the former administration of the New Haven to improve the service as was planned and desired:

In discussing the remedy to be applied to the general railroad situation, Commissioner Prouty says:

What is needed first of all to improve the railroad situation in New England, is rest and an opportunity for constructive work. There is much truth in the claim of these carriers that they have been so occupied with investigations and so criticised by the public that no fair opportunity has been given for the operation of their railroad properties. No railroad management can succeed without the support of the public which it serves. It must not be forgotten that the railroad is a public servant in fact as well as in name, and that the service which it renders depends largely upon the treatment which it receives from its master.

The management of the New Haven immediately after the publication of the Commission's report, announced that a meeting of the division and mechanical superintendents had been called to consider the report and recommendation of the Commission relative to recent accidents. Immediate steps, it was stated, would be taken to bring the railroad up to the standard recommended in the Commission's report. At the same time, General Manager Bardo who issued the statement, was emphatic in his claims for the excellence of the passenger service of the New Haven which indeed, as just shown, was approved by the Commission. Says Mr. Bardo:

The Interstate Commerce Commission, in its report upon the financial affairs of the company stated that the New Haven passenger service, aside from safety, is distinctly better than that of any railroad coming into New York. The officials of the company have always believed that the trains are operated under as safe if not safer conditions than any other road in the country, and the record of train accidents upon the New Haven Railroad would seem to warrant this view. In the past ten years the company has carried over 755,000,000 passengers, and had but six train accidents in which passengers have been killed. The total number of deaths resulting from these six accidents is only 29. The passenger traffic of the New Haven Railroad is the densest of any railroad in the country.

The publication of this report was almost coincident with the retirement from the presidency of the New York, New Haven and Hartford of Charles S. Mellen. President Mellen's statement, in retiring from the presidency, was characteristic of the man. It was as follows:

That in his opinion, a condition existed that was full of disquieting possibilities for the New Haven road and its allied properties.

That it was useless to discuss the reasons for or the causes of that condition.

That the condition had to be met, and that the only way it could be met, having proper consideration of the property, was by his resignation.

That everything he had done would be in time justified, but there was a question whether, if he remained to work the problem to the justification, it would not be still further embarrassed. He therefore resigned.

We have previously called attention to the great work which President Mellen did and the much greater work which he attempted to do, in developing the New Haven and Hartford and the Boston and Maine into a unified transportation system which could adequately serve and properly represent the transportation interests of New England. In the course of his administration, as he frankly admitted, he had made mistakes. For some of these mistakes he was alone responsible, in other cases his views and objections had been set aside and overruled. His was, however, the sole public responsibility for whatever was done, and with characteristic frankness and courage he did not hesitate to accept it.

Digitized by Google

Most of the work which President Mellen has done will endure. Some things which he did, and whose unwisdom he has himself admitted, most of these involving operations outside the field of railroad transportation, will be undone. Especially is it believed that the large investments of the New Haven in trolley lines will be considerably reduced.

The new president of the New Haven who assumes the duties of his office on September 1 and who will be elected chairman of the Board in October, is Mr. Howard Elliott, formerly president of the Northern Pacific. The keynote of President Elliott's policy in the administration of the New Haven and Hartford is contained in the following extract from a statement issued immediately after his selection by the special committee appointed by the Board:

It is plain, however, that the New Haven and its associated roads are a great instrument of commerce laid out on a broad foundation, but needing much painstaking work and the expenditure of much money to make them entirely adequate and satisfactory to the people they serve.

It is plain, also, that the success or failure of these lines is inter-dependent with the success or failure of many forms of business in the States which the lines serve.

We hear much about conservation in these days, and it is a most important question. The conservation of railroad service is as important to New England as is the conservation of her soil, of her water power, and of her factories. This railroad service can only be conserved by having all who are interested in the welfare of New England fair, prudent, patient, and courageous enough to take a broad, far-sighted view of the whole situation.

No board of directors and no railroad executive can conserve railroad service without being prudent and fair themselves, and without fair and reasonable treatment and support of governmental bodies—fair and reasonable attitude and support of the press and of the traveling and shipping public, and the great army of owners and employes. Unless all these classes are fair, sensible, without prejudice, patient and helpful each to the other, the best results and the results that the public desires, cannot be obtained. Criticism is expected, and fair criticism does good. Unfair attacks waste the mental energy of the officers and break down the esprit de corps of the army of employes.

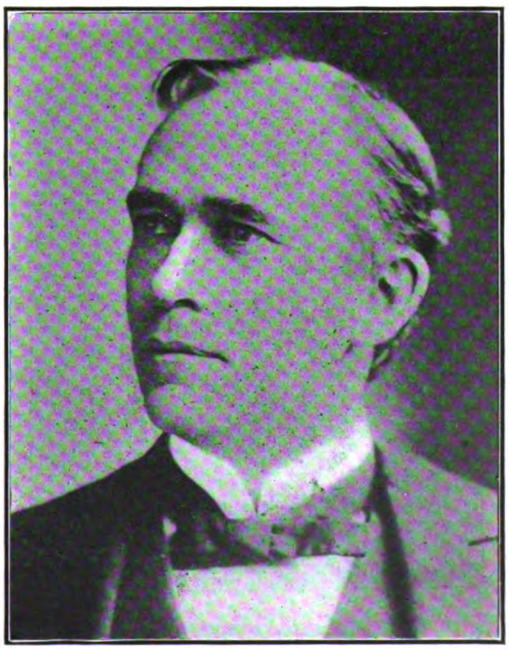
I believe most thoroughly in the fundamental strength of the New England properties, in their ultimate ability to furnish the transportation needed by New England, and in the final good sense and fair judgment of the public. And I believe that the problems now presented to the management and to the public can, must and will be solved.

PROGRESS IN PHYSICAL VALUATION PLANS

Substantial progress is being made with the organization of plans for making a physical valuation of the railroads. Railroad commissioners in fifteen States will co-operate with the Interstate Commerce Commission in making this valuation which will materially reduce

GEORGE B. MCGINTY,

Secretary of the Interstate Commerce Commission, who recently suggested to Congress a method of subdividing the country for Physical Valuation purposes.



CHARLES M. PROUTY,

Interstate Commerce Commissioner having charge of Physical Valuation Plans.

Digitized by Google

the joint expense. According to a report which was complete last year, valuations of one or more railroads have been made in twenty States, in most of these, however, there have been no extensive or thorough appraisals or inventories. It is believed that the Interstate Commerce Commission will begin its valuation of the railroads in those sections of the country where the States have made no start. A possible objection to the plan of co-operation is found in the existence of varying standards of valuation among the different States, for the most part the States have made no allowance for intangible values but have devoted their attention to original costs. Marked differences in the standards of cost, however, exist. It will be impossible for the Commission to devise a plan of valuation which will meet the views of all the States. A large amount of data, however, which has been collected by the States, will be available.

INCREASING THE WEIGHT LIMIT OF THE PARCEL POST

The announcement of the Postmaster General that the limit of packages to be transported by parcel post will soon be advanced to 20 pounds, and the confident expectation, based on official utterances, that the limit will be further advanced to 100 pounds, coincides, in point of time, with sweeping reductions by the Interstate Commerce Commission in the rates charged by express companies, the average cut for the entire country is about 16 per cent, which, it is estimated, will reduce the revenues of the express companies about $26,000,000 a year. Practically all rates have been reduced for 50 pounds or less. By prescribing the so-called "Block System" the Commission divides the United States into 950 blocks, each averaging 2,500 square miles. This system will apply between all points in the United States.

This order falls upon the railroads equally with the express companies. It comes at a time, moreover, when the railroads are being seriously discriminated against in the payments for mail carriage. At the present time they are underpaid for the carrying of the mail by at least $15,000,000 a year, a large amount of service being demanded for which no payment whatever is made. This is the substance of a statement issued on July 27th by the Railway Mail Pay Committee of the 264 principal American railroads operating over 218,000 miles of line. The substance of this statement is as follows:

ALBERT BURLESON,

U. S. Postmaster General who has been criticised by certain members of Congress for extending the scope of the Parcel Post.

To carry the people's mail quickly, safely and frequently is a social obligation which the railroads freely concede. It is a service voluntarily performed, for no law compels a railroad company to carry mails unless it contracts to do so. The courts hold, however, that if the railroads do contract they must do so on terms named by the Government.

Though surrounded by these anomalous conditions, the railroads have without stint placed their resources at the disposal of the nation to develop the transportation of mails to the highest possible state of efficiency. This service has been paid for at a price fixed by the Government, a price from which the carriers have had no appeal.

The United States Government in 1912 paid the railways $51,697,374.49 for carrying mail. This was about 20.95 per cent of all postal revenue. In 1901 the railways had received 34 per cent of the postal revenue. In the same year, 1901, the Joint Committee to Investigate the Postal Service, of which Senator Wolcott was chairman, reported to Congress its opinion that "the prices now paid to the railroads for the transportation of the mails are not excessive." Yet in 1907, the Postmaster General, by administrative order, reduced railway mail pay by nearly $5,000,000—about 10 per cent—and Congress cut off about 2 per cent more by reductions in rates of pay for carrying the mails and for the use of postal cars.

Contemporary Opinion

Railway Mail Pay and the Parcel Post.

CONSIDERABLE space is given in this issue to the question of Railway Mail Pay. Newspaper editors, in many instances, are showing their sympathy with the railway managers' efforts to have this matter adjusted on an equitable basis. As the "Baltimore Sun" puts it:

"The railroad managers' committee on railway mail pay, of which Ralph Peters, president of the Long Island Railroad, is chairman, has issued a statement saying that the railroads are underpaid at least $15,000,000 a year for carrying the mails. They object not so much to the standard of measurement as to the fact that they are allegedly called upon to do a great deal of work for which they receive no compensation whatever.

"This is an old controversy, and, in truth, it must be said that the railroads present a strong case. A Congressional Committee of inquiry is now investigating the matter, and the railroad men's statement referred to will be presented to it. It is very important that the matter be settled promptly and fairly, because the railroads, illogically but perhaps naturally, are trying to complicate this case with that of the parcel post and are opposing the changes ordered by Postmaster-General Burleson because, they intimate, they will not be properly paid by the Government for carrying the parcels.

"The two questions, of course, are entirely separate ones, and neither Congress nor the people must allow the railroads or the express companies to tangle the two. But the best way to avoid any possibility of this being done would be for Congress to push the matter of railway mail pay to a conclusion as quickly as possible, and specify payments the justice of which cannot be questioned."

In referring to the recent action of the Postmaster-General in increasing the limit of parcels carried under the parcel post law to twenty pounds, and also reducing the rates in certain instances, the "New York Journal of Commerce" has editorially, in part, the following to say:

"The next move is said to be contemplated for raising the weight limit to 100 pounds with corresponding changes in rates. Like all such ventures in Government business there is a tendency to expand and overdo, and there is really no trustworthy means of testing the financial results. They are mixed up with the indirect expense of buildings and equipment and general government administration, which disguise the effect. The Government is not expected to make a profit in competing for the express and merchandising business, but we need more exact methods of determining cost and efficiency."

One-Sided Arbitration.

THE result of the arbitration of the Eastern trainmen's wage controversy under the Newlands Act, is awaited with unusual interest not only by railroad officials, but by all those interested in the proper economic progress of the country.

An interesting sidelight in this particular controversy has been the demand of the railway managers that certain of their grievances regarding working conditions and wages should also be arbitrated at the time the trainmen's demands are considered. Under considerable pressure, the railroads finally agreed to withdraw their request for the present, but it is not unlikely that they will again demand a hearing, as they justly feel that certain conditions of which they complain would not stand the scrutiny of such a board without relief being granted. As the "Baltimore Sun" puts it:

"The trainmen object to the railroads' proposition to have all questions submitted to the board of arbitration, and not the question of wages alone. But to the dispassionate public some of these other questions, such as that of the full crew, have a very close connection with the fair adjustment of the wage question. We take it that all that the trainmen want is a fair and just settlement of the controversy, and that they would not seek an unfair advantage by insisting on a narrow technicality. If the railroads are to be made to do the fair and square thing, why should the trainmen object to submitting to the same just principle? What is sauce for the railroads ought to be sauce for the trainmen."

On the same subject, the "New York Journal of Commerce" says:

"If the conductors and trainmen of the Eastern railroads think that they ask for only what is fair and reasonable in the demands which they are willing to submit to arbitration under the amended law, why should they object to the railroads presenting their grievances and asking that they be considered by the same board? Are not the railroads entitled to what is fair and reasonable in their payment for the services of their employes, just as they are required to conform to what a Board of Commissioners decide to be just and reasonable in their charges to shippers? Is not a Board of Arbitration constituted as the new law provides as likely to do justice with regard to what the railroads ask for as with regard to what the conductors and trainmen demand?

"The requirements of which the managers complain have been imposed by the unions and conceded to avoid trouble. They involve in some cases full pay where there is not full service and extra pay, even double pay sometimes, differences of compensation where, they allege, there is no reason for them, guarantees which are not justified, and so on. They say that there are 'perquisites' in the service which are not reasonable and which cost the companies a good deal of money without due consideration. Perhaps the managers are wrong about this, and there may be good and sufficient reasons for what the employes claim. That is a matter to be inquired into and adjusted with due regard to just claims on both sides.

"Why not have these matters inquired into as well as those of which the conductors and trainmen complain? The railroads cannot force anything by stopping operation or threatening to do so and they cannot get better pay for their service without the consent of an official Government board, but that is no reason why they should not have fair play. It does not look well

Digitized by Google

for the men to insist that the arbitration shall be one sided, that no claims but their own shall be considered. It looks as though they were not confident of the justice of what they have already secured and were not willing to have judgment passed upon it."

The "Buffalo Commercial" pertinently states that the railroads undoubtedly have grievances to arbitrate as well as the men and certainly have the same right to be heard by an impartial tribunal. Continuing along this line of argument, it says:

"Why should any one oppose giving them a hearing? If their claims are just they ought to be recognized and their wrongs righted. If on the other hand, their grievances are not well founded, the Commission in denying them will simply perform one of its statutory duties.

"Railroad men ought to be the last to protest against giving the roads a hearing upon their list of demands. Arbitration is by no means a one-sided proposition. A board of mediation was not created for the simple purpose of resolving the demands of organized labor for better pay and changed working conditions, and all fears expressed that this latest move of roads will prevent arbitration of the pending claims should be dispelled at once. What is fair for one is fair for the other. The reply of the men to the demands of the railroads, if it is a manly and honest one, will not oppose the arbitration of all claims that are presented in good faith and are entitled to adjudication."

Speaking of the questions which the railroads desire arbitrated, the "New York Commercial" says:

"The most important question raised by the railroads is their claim that the wages of brakemen should be reduced to twenty per cent when the railroads are compelled to employ two men to do the work of one under the provisions of 'full crew' laws. The railroads have always contended that these laws impose unnecessary burdens on them and do not add to safety in operating trains. The states which passed these laws gave the railroads no compensation for the added cost, and it is conceivable that these burdens might be piled up to a ruinous extent. The railroads, therefore, seek to establish the principle that when a man does only half the usual amount of work his pay should be reduced.

"The labor lobby was directly responsible for these 'full crew' laws. The design is to give employment to more men and thus increase the numerical strength of the labor unions. Men were to be drawn into these unions by the hope of 'soft snaps,' and the State Legislature passed these laws to catch labor votes without considering the safety of the public or the added burdens of the railroads.

"Other 'soft snaps' will also be ventilated if the railroads are permitted to present their side of the case. One of these is extra mileage without extra time or work, and another is the full day's pay for a short run accompanied by double pay for overtime when a train is delayed. This combination gives the men double time for accidental overtime and no allowance is made when they work part time only."

In considering the question of the demand of the men themselves for increased wages, the "Baltimore Sun" points out that this demand "differs from the similar demands from enginemen and firemen in several respects. One is that the trainmen were given an increase three years ago. It cannot be said, then, that the present movement is intended to bring their wages to an equal basis with those of other railroad employes. Rather, if another increase is to be granted them, all the other employes will be asking additional increases in order to be put on an equality with the trainmen.

"This demand, then, raises in an acute form the question whether the railroads are to be allowed to raise their freight rates in order to compensate them for the increasing sums they are obliged to pay for wages. Fair-minded men are about agreed that the limit has been reached and that the average railroad from now on must either get increased rates or furnish inferior service. In either case the people pay the bill; we should never forget that. The only question is whether we shall pay the bill with our eyes open or shut."

The Freight Rate Inquiry.

THE inquiry by the Interstate Commerce Commission into the justice of the demands by eastern railroads for an increase in their freight rates, has begun under unusually favorable auspices so far as the carriers are concerned. A noticeable leaning towards their side of the case is evidenced in newspaper editorials, while various commercial and shipping organizations have taken occasion to voice their approval of the necessity for some action being taken whereby the railways can increase their revenues. Discussing this matter editorially, the "Buffalo Commercial" says:

"Announcement that the Interstate Commerce Commission has begun an inquiry into the request of fifty-two railroads to increase freight rates five per cent is encouraging, for the roads will at least have an opportunity to present their side of the case.

"There should be little trouble experienced in convincing the commission that there are good and legitimate reasons for presenting the request, in view of the heavy burdens which have been placed upon the roads by recent legislation and the demands for increased wages which they have granted. Added to these features of the case is the large amount of money which will be required to place road equipment in shape to meet the constantly increasing requirements of the freight carrying business.

"There is a strong public sentiment that the roads are fully justified in their contention that an increase in rates is not only just to shippers, but absolutely necessary if the ability of the roads to handle the rapidly increasing volume of business is to be maintained."

In discussing the various angles to be considered in an investigation and readjustment of this kind, the "Journal of Commerce" points out that:

"The general argument in regard to the need of higher rates to support the credit of at least some of the roads and enable them to raise capital for necessary improvements, is a strong one, but the shippers who are disposed to contest the application appear to be a good deal divided. A point upon which some of them are laying stress relates to what they call a 'horizontal' advance, that is, an advance by a uniform percentage upon all present rates by all the railroads. The question is raised whether the re-

Digitized by Google

cent Supreme Court decision, allowing an advance in some of the intrastate rates and refusing it to others on account of differences in the financial condition of the roads will not be a bar. It is contended that the advance asked for might be just and reasonable in some cases and not in others, and that it should be determined in each case with reference to a fair return upon 'the value of property devoted to public use.'

"This gives prominence to a difficulty which we have already pointed out with reference to the recent rate decisions. There is a good deal of difference in the conditions and necessities of the roads in this eastern 'official classification territory.' It is claimed that some of the stronger roads do not need the advance, while the weaker ones may; but, if it should be allowed to the latter and not to the former, the real effect, in so far as there is competition between the lines, would be to make the strong stronger and the weak weaker by diverting traffic to those upon which the cost of transportation was lowest. Rates have long been adjusted with reference to a certain restraint upon competition to give all a chance to live, though there may be no 'unlawful' agreement or combination. Suppose that plan is abandoned and the roads which most need to increase earnings are allowed to advance rates and the others not. The actual increase of earnings would be likely to accrue where it is not needed rather than where it is, and the last state of the weaker roads would be worst than the first. The tendency of that would be toward bankruptcy and receiverships for some or their consolidation with others, if that were permitted. This forces a new question to the front to which the Commission may have to give serious attention."

The New Haven's New Head.

NEWSPAPER editors, both in New England and elsewhere, are emphatic in their praise of the new executive head of the New Haven, and congratulate both the road and the section of the country through which it operates, for procuring the services of a man whose reputation places him in the front rank of modern, progressive railway officials. As the Boston "Evening Transcript" puts it:

"No selection of a man to invest with the leading responsibility of directing the transportation interests of New England that would better satisfy the public of this section could have been made than has been made. The past record of President Howard Elliott, of the Northern Pacific inspires confidence. The task that he is to undertake is one that involves many burdens and complexities, but we think that the people of New England have reached the point where they will give him their wholehearted co-operation. His training has been broad and his service in previous positions successful. His enunciation of the policy that he proposes to follow in his dealings with the stockholders, the public and the State encourages us to believe that these interested parties under his administration will be the partners that they always should have been.

"The most impressive and encouraging statement that he has made is that 'the laws, rules and regulations laid down by proper governmental authority, will be obeyed,' and if these seem to hamper effectiveness the people will be asked to change them in their own interests, as well as in the interests of the railroads. As has been declared upon high governmental authority, this has not invariably been so in the recent past. We may fully trust Mr. Elliott's sincerity in this matter. We may also trust the genuineness of his interest in New England development. He is a New England man, with strong New England affiliations, even when his duties made him for the time being a westerner. The roads that serve New England will be recognized as New England properties, and their headquarters will be in the metropolis of the section.

"This of itself is a gain upon which our people have reason to felicitate themselves. The direction of our interests is no longer to be at arm's length. Each separate branch of the entire system is to have a separate head while as soon as the by-laws will permit, Mr. Elliott will be invested with general supervision of the whole. This gives promise of a definite fixing of responsibility on all the lines and invites the hope that hereafter there will not be so much left to chance as hitherto. The organization of the New England conference of the States has been a practical and a timely movement. Mr. Elliott will find it not only willing but anxious to cooperate with him in the common purpose which we believe both entertain.

"The new head of our system is probably not entering upon his labors under any delusions, and the confidence he has in himself and his willingness to undertake them are encouraging signs. While he who puts on the harness is not entitled to boast himself as he that taketh it off, there has scarcely been in the history of our transportation industry a more splendid opportunity for constructive service and the rewards and satisfaction that it will bring than New England presents to-day. We must not expect sudden transformations, but if we can see steady progress and right purpose, the public patience will hold out until these attain their consummation."

Panama Possibilities.

THE "New York Commercial" has the following to say with regard to the attitude of European shipping interests and those of this country, concerning the commercial opportunities incident to the opening up of the Panama Canal:

"The announcement that the Panama Canal could be put in operation this fall if necessary, indirectly emphasizes how thoroughly European interests have grasped the meaning of the fairway through the Isthmus. No less than 32 organized steamship companies in Europe have arranged to enter the trade which will use the canal, and among these are some of the strongest factors, financially and in the tonnage of bottoms operated, in the water carrying trade. True, many American lines also have arranged to enter the trans-canal traffic, but apparently the importance of being ready when the canal is opened has not been as thoroughly sensed in America as in Europe. Perhaps the nearness of the picture destroys the perspective.

"Whatever the reason, European ship owners are straining every nerve to be prepared to cargo the largest possible share of the water-borne freights which will supply the demands of the west coast, South and North American trade. In European shipyards more than sixty steam-

Digitized by Google

ships are reported under construction for canal services. In American shipyards, how many? Not one-half. Probably not one-third are under way or definitely projected.

"While both North and South America will benefit from the improved facilities to be afforded the west coast, the casual, almost indifferent, attitude of the people of the eastern United States and of the financial marine interests generally, contrasts strongly with the keen determination of Europe to avail itself of the numberless advantages to accrue to those who, as Nathan Bedford Forrest said of the secret of winning battles, 'git thar first with the mostest men.' The wonderful thirty-year transformation of the Argentine will be duplicated along all the west coast of South America. Where now a steamer puts in once a fortnight, steamships will arrive or depart daily, and ports of occasional call will become thriving radii of maritime commerce.

"A few of our business interests are awake, but most of the efforts in evidence appear to be directed toward arousing the other fellow to action rather than toward getting the other fellow to join in the practical working out of plans to add to the number of American steamers which will use the Panama Canal."

The Signing of the Sundry Civil Appropriation Bill.

IN signing the Sundry Civil Appropriation Bill, President Wilson has called forth a general and vigorous condemnation on the part of many newspaper editors throughout the country. This bill, as has been stated in past issues of the "Railway World." contains a rider or proviso, to the effect that no part of the money appropriated for the enforcement of the anti-trust law should be spent in the prosecution of labor organizations or farmers' associations. While it is true that President Wilson signed this bill under protest, newspaper editors see in such action a vacillating attitude and a desire, through class legislation, to appeal to the labor vote of the country. In discussing this class of legislation, the "New York Evening Post" says:

"All general legislation tacked upon an appropriation bill is bad in theory and in effect. So clearly was this recognized by the framers of the New York Constitution that they positively forbade 'riders' of any kind on appropriation bills. If the law is to be changed, let it be done directly and openly, not by trick or covert methods. And the particular rider on the Sundry Civil bill was peculiarly offensive and dangerous, since, in addition to furtively meddling with the anti-trust act, it sought to exempt two classes of citizens from the equal operation of the laws. Mr. Wilson himself frankly declares that this is 'unjustifiable in character and principle.' He adds that if he could veto this item of the bill by itself he would. In our opinion, he should have used his veto in the only way open to him, sent the whole bill back to Congress as Taft did, and raised the issue sharply before the whole country whether legislation of this kind is to be tolerated under a government that professes to know no favored classes."

The "Buffalo Commercial" expresses a great disappointment over the President's action from whom it evidently expected a different attitude. Editorially, is says:

"The President has finally signed the Sundry Civil Bill which provides that the money appropriated for the prosecution of violators of the Sherman law shall not be used against labor and farmer organizations. President Taft vetoed the bill on the ground that it was 'class legislation of the most vicious kind.' Mr. Wilson admits that the exemption is 'unjustifiable in character and principle,' and that being the case he ought to have put the responsibility squarely upon the shoulders of Congress and done as his predecessor did.

"The President explains that there are other funds which can be used to enforce the anti-trust law, but the fact that he has signed a bill which plainly declares the policy of the government to make fish of one criminal and flesh of another will operate to save the labor unions, because no suit against them can be successfully prosecuted in any court of justice so long as Congress has thus given this interpretation to the law.

"The fact of the matter is that Mr. Wilson lacked the courage of his convictions. He was afraid that by doing his plain duty he would alienate the support of organized labor and farmers who believe that they ought to be privileged to violate the law. His failure to veto the measure will painfully disappoint some of his best and most loyal supporters."

Steel Car Safety.

THE "New York Commercial" has the following to say with regard to the comparative safety of steel cars in railway wrecks:

"The steel passenger car again proved its worth in a bad wreck on the Lehigh Valley Railroad Sunday morning. As far as the express was concerned this accident was as nearly unavoidable as it is possible to conceive. An accident to a freight train threw cars across the passenger track just as an express train came along at fifty miles an hour. Some passengers were hurt by the tremendous shock but not one of them was killed and no fire added to the horror. Wooden cars could not have stood the crash and fearful loss of life would probably have occurred had the train been made up of them.

Railroad companies have not had time to substitute steel for wood in their passenger equipment, but the traveling public is becoming insistent in its demands for the safer steel cars. Many railroads cannot make the change because they have no money and can borrow none at present. To abandon millions of dollars worth of wooden cars in good condition and buy steel cars would bankrupt some of them. The best they can do is to stop buying wooden cars.

"If the railroads could raise their rates they could make the change more quickly. They have spent millions on air brakes, safety couplings, electric lights for cars, safety block systems and improved switches. It is unfair to blame them for keeping wooden cars in service. Would the public be willing to pay higher rates for a few years if the railroads appropriated the increase to the prompt purchase of steel cars? It is safe to say that nine travelers out of ten would prefer to take chances in wooden cars. Yet the proposal is fair because the railroads would be sacrificing their investments in wooden cars which were the best obtainable until within very recent years."

The Railroads' Appeal for Fair Payment for Carrying the People's Mail

EDITOR'S NOTE.—The following statement recently prepared by the Committee on Railway Mail Pay, of which Mr. Ralph Peters, President of the Long Island Railroad Company is chairman, and representing 264 railroad companies of the United States, presents the railways' reasons for a more just method in computing the compensation received by the carriers for transporting the mails. Under existing conditions, there is no escape from the conviction that the Government is procuring a vast and valuable service from the railways, for a part of which no compensation is made. This is peculiarly true since the passage of the parcel post law and the more recent regulations regarding the application of this law permitting a large increase in the size of packages carried.

RALPH PETERS,

President of the Long Island Railroad, and Chairman of the Committee on Railway Mail Pay.

ACCORDING to the recent testimony of Second Assistant Postmaster General Stewart before the Joint Congressional Committee on Railway Mail Pay, "The railroads perform a wonderful service for the Government and for the people, and if it were not for the railroads, mail service would be a vastly insignificant thing."

To carry the people's mail quickly, safely and frequently is a social obligation which the railroads freely concede. It is a service voluntarily performed, for no law compels a railroad company to carry mails unless it contracts to do so. The courts hold, however, that if the railroads so contract, they must do so on terms named by the Government.

Though surrounded by these anomalous conditions, the railroads have without stint placed their resources at the disposal of the Nation to develop the transportation of mails to the highest possible state of efficiency. This service has been paid for at a price fixed by the Government, a price from which the carriers have had no appeal. Railroad officers have felt, ever since the present method of railway mail payment was established in 1873, that this compensation was unjustly low.

This opinion is still held by experienced railroad officers throughout the country, but with even greater firmness and earnestness, on account of the increasing costs of railroad operation combined with frequent heavy reductions in railway mail pay made by the Government.

The United States Government, in 1912, paid the railways $51,697,374.49 for carrying mail. This was about 20.95 per cent of all postal revenues In 1901 the railways received 34 per cent of the postal revenues. In that same year, 1901, the "Joint Committee to Investigate the Postal Service," of which Senator Wolcott was chairman, reported to Congress its opinion that "the prices now paid to the railroads for the transportation of the mails are not excessive." Yet, in 1907, Congress reduced railway mail pay by $2,723,000, about five per cent, and the Postmaster General, upon his own initiative, by Administrative Order, made a further reduction of nearly $5,000,000, about ten per cent; an aggregate reduction of $7,700,000 per annum, or fifteen per cent.

The railroads maintain that at present they are underpaid by at least $15,000,000 per year. It is their belief that a fair adjustment would require that the Government should pay the railroads for all services they render.

The complaint of the railways is not against the standard of measuring such mail service as is paid for, but that a very large amount of service is demanded for which the nation makes no payment whatever.

PRESENT METHOD OF RAILWAY MAIL PAY.

Railroads are now paid for carrying the mails by two methods of measurement:

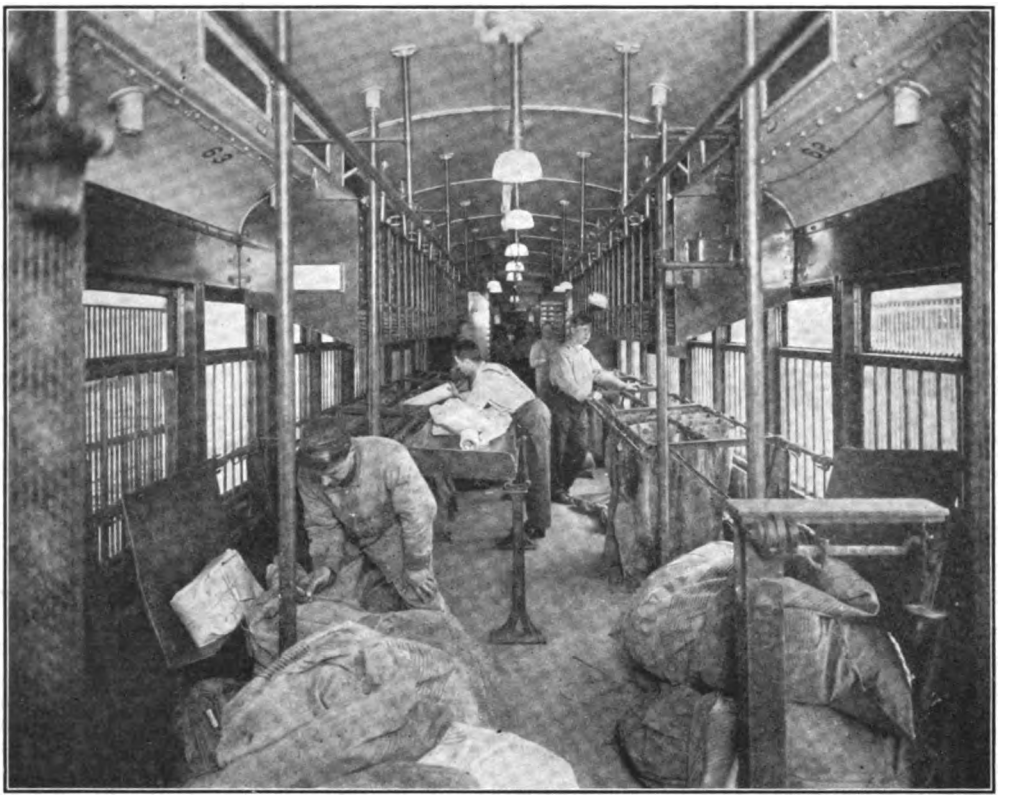
1. According to the weight hauled each mile; and

2. For each mile a postal car is used for sorting mails en route.

The railroads claim, however, that the Nation does not pay for the entire weight carried or all the car space utilized for sorting. In detail:

1. **Weight.** Ninety per cent of all the money paid to the railroads is for the weight of mail carried. This is entirely proper, and it is also but just that the law should stipulate that the rate of compensation should automatically diminish as the weight of mail carried increases. Weight is the standard by which freight rates and express rates are applied. It is a universal measure of the service of hauling goods. It is an automatic adjuster. On this basis the quantity of the mail itself, multiplied by the distance it is carried, determines what the compensation shall be, and pro-

Digitized by Google



INTERIOR OF A 70-FOOT ALL STEEL RAILWAY POST OFFICE CAR.

In the foreground observe the steel racks for holding the sacks open, into which the second, third and fourth-class mail is assorted. Note the overhead boxes running down both sides of the car, also used for these classes of mail and permitting of over 200 separations simultaneously. The letter mails are assorted in the winged cases in the background, these having 748 pigeon holes, and consequently permitting of that number of separations at one time. In the particular car here illustrated there are five railway postal clerks at work. In other similar cars there are sometimes as many as eight or nine clerks. The extra pay for Railway Post Office cars, in addition to the weight pay, ranges from 3.4 cents per mile for a 40-foot car to 5.4 cents per mile for a 60-foot car. The law of 1873 does not make a rate for a 70-foot car. The paying load in these cars averages only 3 tons of mail, although the car could easily contain 20 tons if the space were not occupied with fixtures used in assorting the mails for different destinations.

tects the railroad companies as it does the Postoffice Department.

The law stipulates that the mail shall be weighed for a typical period at least once every four years and that payment shall be made during the entire period according to the average weights then actually ascertained. In practice, the Postoffice Department has construed this law to mean that the mails shall be weighed not oftener than every four years. The result is that though there is a constantly increasing weight of mail, the railroads receive no payment whatever for the increase until the next quadrennial weighing period, when a basis is arrived at which shall govern the payments to be made for the succeeding four years. When, at the end of four years, it is found that a very decided increase in weight has taken place, no back pay is permitted for the mail which was actually carried in addition to the average weight ascertained four years before.

An illustration of the injustice of this quadrennial weighing system is in the fact that just after the weighing of the mails in Ohio in 1907, the printing of stamped envelopes and newspaper wrappers was changed from New England to Dayton, Ohio, so that many railroads have been required to handle this traffic for four years without compensation, while other roads have been receiving for the same period compensation for services not performed. After handling this matter at Dayton for about three years and before the next succeeding quadrennial weighing, the Postoffice Department withdrew a large amount of this matter from the mails and shipped it by freight. Thus the railroads will never receive one dollar in compensation for all of this mail which was handled during that period.

This principle is at present working great hardship to many railroads. The parcel post started January 1, 1913, and immediately there was a great increase of mail and a reduction of express matter for which the railroads had been previously paid. Congress has allowed a five per cent increase in pay to compensate for the parcel post, but the records already indicate that the Government's postal revenues will increase this year from 20 to 30 per cent on account of the parcel post.

In considering the foregoing, it should be un-

Digitized by Google

derstood that the Government makes no additional payment for speed or for frequency of service. There is no greater pay accorded the railroads for carrying mails at a speed of sixty miles per hour than for fifteen miles per hour. There is no greater pay for 100 trips a day than for one trip a day. The aggregate weight of mail carried, and therefore the pay, is the same, whatever the speed or whatever the frequency with which it is carried.

The railroads are required to take on scheduled trains all mail, even if necessary to exclude and hold back baggage or express matter. In fact, it is not an uncommon thing, in St. Louis for instance, to unload both baggage and express, and place mail in baggage cars in order to supply the space needed to carry all of the mail presented.

The railroads maintain, therefore, that while weight is the proper measure of pay, it should be ascertained every year and paid for accordingly.

2. **Railway Postal Car Service.** To facilitate the distribution of mail en route, the railways have provided 1,388 traveling postal cars. They are fitted with every modern appliance and every comfort for the clerks who shall work in them. Full railway postoffice cars of all sizes traveled 126,798,405 miles in the performance of service during the fiscal year 1912. Passenger cars on American railroads the same year yielded revenue of about 25 cents for each mile run. If the railway postal cars had yielded as much per mile, it would have amounted to a total of $31,699,601.

Yet the railway postal cars only constitute about 38 per cent of the entire car space devoted to the United States mails, the other 62 per cent being in mail apartment cars, mail storage cars, and baggage cars.

On a number of routes pay has been allowed for running full cars in one direction only. This obliges the railroad to move the car in the opposite direction without pay. To illustrate: The Union Pacific, in one case, receives no pay for handling eastbound, between Council Bluffs, Iowa, and Ogden, Utah, 1,003 miles, a sixty-foot mail car which is paid for westbound only. For the round trip the company receives 2.24 cents per mile, or about the fare of a single passenegr, although a standard coach of the same size will carry seventy passengers.

These railway postal cars in many cases must be placed in stations from two to seven hours before the time of the train's departure, in order that the clerks may have opportunity to begin sorting the mails. This saves the Postoffice Department the rental of outside office space for that purpose.

INTERIOR OF A 30-FOOT APARTMENT IN AN ALL STEEL COMBINATION MAIL AND BAGGAGE CAR.

In the foreground observe the steel racks for holding the sacks open to assort second, third and fourth-class mail; also the double row of overhead side boxes used for the same purpose, both to permit of 106 separations to be made at one time. The large pigeon hole case in the background is for sorting letter mail into 312 separations. There are four railway postal clerks at work, also one weigher. Note the Parcel Post packages, occupying much space, but contributing little weight. Although the post office work in this apartment is similar to that of the full Railway Post Office car, the law provides no extra pay for the extra car space required by the Post Office Department. The paying load in these 30-foot apartments averages only 1500 pounds, although there is room enough for 10 tons of mail if the space were not occupied with fixtures used in assorting the mails for different destinations.

Digitized by Google

Where such track space is used in expensive terminals, such as the Grand Central Station in New York, this item is of considerable account.

The position of the railroads is that the effect of the present practice is to compel much railway postal car service which is not paid for; and that the Act of March 2, 1907, reducing postal car pay was without warrant.

The complaint of the railways is not so much against the standard of measuring such mail service as is paid for, but that a very large amount of service is demanded for which the Nation makes no payment whatever.

Railway Service for Which No Payment is Made.

For the foregoing elements in the railway mail service—weight of mail transported and railway postal service—the Nation makes certain though partial payment. But as was stated by the Wolcott-Loud Commission in 1901, "The railroads perform many services and afford many facilities for which the law does not allow and the railroads do not receive any compensation." That statement is no less true to-day than it was in 1901. Under the law the Postoffice Department alone determines how far the Government shall compel these free services, and that department has uniformly pursued a policy of considering the efficiency of the postal service regardless of how far provision had been made for compensating the railroads for the additional burden imposed.

Those services rendered the Nation for which the railways receive no compensation are the following:

1. *Providing apartments for mail distribution in combination baggage cars.*

Though the Government has recognized that the space used for the distribution of mail en route should be paid for, the law stipulates that there shall be no payment for such space unless the car, or portion of the car, used aggregates forty feet in length. As a matter of fact, a very large number of cars have distribution space of from but ten to thirty feet. Some 4,029 such cars are now in use with space utilized for the mail service aggregating 92,866 linear feet, equal to 1,548 full 60-foot postal cars. This is 160 more than the number of full cars actually in use and paid for by the Government. Yet for the sorting space in these compartments the Government makes no pay whatever.

> On the Pennsylvania Railroad's 20-hour trains between New York and Chicago 13 feet of space for the use of the postoffice is set aside and fitted up with necessary sorting apparatus. The trains carry about one ton of letter mail with the postal clerks who distribute it. The revenue from the mail is solely for weight, and results in compensation of about seven cents per mile going from New York to Chicago, and about three cents per mile in the opposite direction—equal to the fare of two ordinary passengers westbound and one eastbound.

2. *Carrying free postoffice employes not in charge of mails.*

Were fair pay to be made for the car space used for the distribution the railroads would make no objection to the transportation of a reasonable number of clerks in charge of mail, or to free transportation of officers of the Postoffice Department having to do with the transportation of mail. But when an employe or agent of the department travels on Government business as a passenger in a passenger car, the Government, it is maintained, ought to pay his reasonable fare. The amount of transportation required by the department and not covered by law, for which no compensation is rendered, aggregates over $1,000,000 in value per annum.

> For the postal clerks who separate the mail in postal cars or apartment cars the railroads have the same full passenger liability as for passengers. Indeed, the United States Supreme Court has recently extended this liability to apply where a postal employe was not even traveling upon official, but was traveling free upon the railroad on personal business.

3. *Railroads must carry the mail between railroad stations and postoffices when such postoffices are within one quarter of a mile of the station.*

This regulation is a survival of stage-coach days, when carriers of mail by stage were compelled to set the mail down at the postoffices. This service is not expected in the transportation of passengers, express, baggage, or freight.

4. *The railroads are also required to transfer the mail between stations or from one train to a connection, if the stations or connections are within one quarter of a mile of each other.*

This unremunerated service in the city of St. Louis calls for 60 porters especially to carry the mails from the different roads to their connections. In Kansas City 85 men are thus required. In Chicago there are 60 such attendants in one station alone.

5. *Railroads are required to provide rooms in the stations for transfer clerks employed by the Postoffice Department.*

6. *Rooms in stations are also provided for sorting mail. This is a charge on the railroad, but relieves the Postoffice Department of the necessity to pay rent for such space.*

7. *The railroads are compelled to provide mail receivers and mail catchers, so that mails may be taken on and put off moving trains, although in Great Britain, where similar apparatus is employed, the Postoffice Department pays for its installation and maintenance.*

Such are the incidental services required for which no payment is made by the Nation.

It is estimated that the extra space in mail apartment cars for traveling postoffices is worth $5,000,000, if paid for at the same rate as full railway postoffice cars, and also that the other incidental services would, if performed directly by the Government, cost even more than $5,000,000.

The railroads urge that distributing space in apartment cars should be paid for.

They maintain, also, that the incidental services referred to should be performed by the Postoffice Department, or the railroads should receive compensation for what they do.

What the Government Found.

In order, if possible, to ascertain the proportionate cost of carrying the mails in relation to other railway passenger services, the Postmaster General, in November, 1909, required the report of most exhaustive data by the railroads. The re-

Digitized by Google

sult was transmitted to Congress on August 15, 1911, in H. R. Document, No. 105. In that report the Postmaster General said that the committee of the department which has compiled the data "estimates that through a readjustment of railway mail pay on the basis of cost with six per cent profit, a saving of about $9,000,000."

This estimate of the costs to the railways of carrying the mails has subsequently been abandoned by the department. This will be apparent from the following:

> Testimony of Second Assistant Postmaster General Stewart, January 28, 1913:
>
> "The Chairman: "Do you mean to imply * * * * that, in your opinion, based upon the information received and the deductions made by you in your study of this question, the railroads have been overpaid $9,000,000 annually for the transportation of mail?"
>
> Mr. Stewart: "No; there is no purpose to make a statement of that kind. The statement which you have read is * * * * solely on the basis of statistics furnished, and the ascertainment made on those statistics, namely, that having considered this data and considered the computations made by the department, the cost of service upon that basis is $9,000,000 less than the amount which was paid to the railroads for the transportation charge." -

The result arrived at "upon that basis" was reached by (a) making a division of railway freight and passenger expenses upon a method having but little sanction in experience; (b) eliminating a large amount of passenger train space reported by the railroads as necessarily used for the mail service; and (c) ignoring the justice of any return upon the capital invested in the railroad plant.

Subsequent to the issuance of Document 105, the Postmaster General submitted to Congress a draft of a revised bill in which he suggested that instead of the method he had originally proposed for paying for carrying the mails at cost of service and 6 per cent additional, there should also be a further sum for return upon the capital employed.

> The Second Assistant Postmaster General, in testifying, January 28th, stated that if the railroad companies were allowed credit for what would be a fair return on the value of the property employed, it would, in his judgment, eliminate the $9,000,000 which it had been stated the railroads had been overpaid.
>
> The Chairman: "Why did the department modify its views, * * * * especially the one of an allowance of a reasonable compensation on capital charges?"
>
> Mr. Stewart. "Because, upon a further and more careful consideration of the subject, we were convinced that the railroad companies were entitled to consideration for this additional element."

What the Service Costs.

Taking the Postoffice Department's own figures, allowing for interest on the plant and making adjustments in the percentage of the plant used, shows the following revised result as to the minimum cost of the service:

1. Interest at 6 per cent on 1.95 per cent (the share of the railway plant used for postal service) of the net capital investment of all the railways in the United States is	$16,380,000
2. The space actually used for mail and incidental thereto, but eliminated from the department's calculations	9,600,000
3. Difference between approved methods and the department's methods of separating freight and passenger expenses	5,000,000
Total	$30,980,000

If this sum is added to the net amount estimated in Document 105, as the cost of carrying the mails, it will yield about $15,000,000 more than the sum now paid for railway mail service.

The railroads maintain, therefore, that the most exhaustive inquiry ever made of this subject shows that a fair payment to the railroads for the actual cost of the service would result in the companies receiving at least $15,000,000 more than they are now paid.

The Value of the Service All Important.

Though it is believed that the mail service is not a source of profit, it is not claimed that the railways could abandon the mail service altogether and save money. The principle governing the case was well stated by President Hadley, of Yale, in his book, "Railroad Transportation" (page 112), as follows:

"Any rate which will more than cover the expense of moving the cars and hauling the goods is a paying rate, provided the business can be had on no better terms." The qualification noted is all important.

Individual railroad rates cannot be based upon the mere cost of service. The only sound principle which experience has shown should cover rates is the value of the service. It is unquestionably this principle which, as President Hadley says, "enables railroads to render most efficient service to the community."

Carrying mail is a commercial service. The postoffice is a commercial department of the Government. If a private company ran the postoffice, there could be no thought of an individual having that company do a service for him at less than a fair rate, and there could be no thought of that private company expecting railroads to transport the mails for other than a reasonable compensation. The postoffice is operated by the Government chiefly because of the economic gain which results from having the whole work done by a single organization. As Alexander Hamilton said, in reference to the Constitutional power over Post Roads: "Nothing which tends to facilitate the intercourse between the States can be deemed unworthy of the public care."

In paying the expenses of the postoffice the Government is not distributing public funds, but it is paying one class of citizens for services rendered to another class. Should the railroads, then, be expected to perform a service for the people collectively at a less rate than would be expected for the same persons individually?

Railway mail service should undoubtedly shoulder its due proportion of the expenses incurred by the railroads in the maintenance of their organizations, as well as in the operation of their trains. The whole system of railroad rates is based upon the thought that mail will pay its due proportion.

Digitized by Google

If the rates for carrying mail should be upon a lower basis (in relation to the value of the service) than other rates, who should make the sacrifice? Must investors accept lower dividends? If so, railroad credit is injured. Must railway labor sacrifice a portion of its wages? Must passenger or freight rates be higher? Whatever the answer, is it not clear that those portions of the community which provide the railway plant and pay for its service would, under such a plan, be taxed to provide postal transportation for those who make use of the mail facilities?

The Government very properly pays citizens in the Federal employ fair prices for their work. When it buys supplies, it pays the market price The Government does not expect to get its heat, light and telephone service at reduced rates. Yet such services are an essential part of the postoffice service.

The Government contracts for the construction of a warship at a price which enables the highest scale of wages to be paid to workmen and allowing a commercial profit to accrue to the contractor. When the Government ships troops or army supplies it pays prices established by the railroad companies, with recourse to the Interstate Commerce Commission in case the railroads seek to impose an unreasonable rate.

In England, where the railroads are privately owned and where the railway mail service is operated under conditions similar to those which prevail in this country, the railroads can appeal to the Railway and Canal Commission if they feel themselves inadequately compensated for their services. In this country, however, there is no administrative tribunal to which the railways may appeal against such a similar burden. There is, however, a provision in the Constitution of the United States which says: "Nor shall private property be taken for public use without just compensation."

It is upon the basis of this constitutional guarantee, convinced of the justice of their case, and believing in the ultimate sense of fairness in the American people, that the railroad companies have appealed to Congress to remove the existing injustices and establish the method of railway mail compensation upon a fair and equitable basis.

Howard Elliott and the New Haven

Editor's Note.—In response to many questions put to President Elliott of the Great Northern, when it became known that he was to become the executive head of the New Haven System, he has issued the following public statement. As a document which frankly sets forth his intended attitude towards the great system which he has been called to represent, as well as towards the public in the territory through which it operates, it strikingly fulfils its mission and has met with general approval.

Statement By Mr. Elliott.

THE newspapers have asked me many questions in the last few weeks about the New Haven road and the New England railroad situation: whether I was to leave the Northern Pacific and associate myself with the New England Lines; if so, when and why; and what I thought about the situation.

These questions are natural and proper in these days when the head of a quasi-public corporation is a sort of a quasi-public servant. And the people through whom and with whom he is to work are entitled to know about the man and his ideas.

Most of the questions I have been unable to answer, and I cannot answer all of them now; but I will try to answer some.

The directors of the New Haven System have complimented me by asking me to become the chief executive officer, and I have accepted.

I realize full well the burdens and responsibilities that must be carried by any railroad executive in these days of complex relations between the Government,—National, State and Municipal:—the public that must be served safely and reasonably:—the owners and employes who must receive fair treatment and compensation for their investment and labor in their effort to produce the service the public demands:—the press that is such a powerful influence in advancing the welfare of the country by creating a sound public opinion. All must work together to produce those results which everyone desires.

Particularly is this true in the case of the New Haven road, and its associated lines, serving as they do a thickly populated part of the United States. States, where to a large degree foodfuel and raw materials must be brought in promptly and regularly from outside of New England and manufactured articles and merchandise distributed in like manner. And where a very large amount of complicated passenger transportation must be furnished to many communities.

I come into the management without prejudice for or against any community, policy, organization, method of work, man, or men. I hope and expect to find many officers and men with whom I can work closely and cordially. I have no wish to displace any man so long as he is needed, and is of good character, loyal, competent, and industrious, and will pull his full share of the load.

The laws, rules and regulations laid down by proper governmental authority will be obeyed. If they are such as to cripple the effectiveness and to hamper the development of the railroad in its effort to help the public, a statement to that effect will be made and a request that the people in their own interest, as well as in the interest of the railroad, will permit reasonable changes.

My railroad work has been west of the Mississippi River, where in July, 1880, I began as a level rodman in western Missouri on the Chicago, Burlington & Quincy; and my work has been with that company, projected, built, and for many years operated successfully by New England talent and money, and with the Northern Pacific; both successful, great and growing properties.

I am a great believer in the growth of the United States and of the West and Northwest; but the same forces that cause growth in those parts of our country will bring steady growth in the states of the North Atlantic Coast, with their varied industries and manifold activities

Digitized by Google

that reach out and touch all parts of our country.

And I am a very great believer in the future and progress of New England. She always has been, is, and always will be a most important factor and influence in advancing the welfare of the whole country.

While my business life has been spent very largely west of the Mississippi River all of my vacation time, with four exceptions, has been spent in New England. So I feel somewhat familiar with some of the conditions.

Fond as I am of the West and Northwest, nevertheless I feel that it will be a great privilege to spend the later years of my business life, working on the Atlantic Coast and in New England, where my boyhood days were passed in New York, New Haven and Cambridge, and where I am fortunate in having many relations on my father's and mother's side.

I cannot at this time discuss details of management and policy because I have little direct information about the situation.

It is plain, however, that the New Haven and its associated roads are a great instrument of commerce laid out on a broad foundation, but needing much painstaking work and the expenditure of much money to make them entirely adequate and satisfactory to the people they serve.

It is plain, also, that the success or failure of these lines is inter-dependent with the success or failure of many forms of business in the states which the lines serve.

We hear much about conservation in these days, and it is a most important question. The conservation of railroad service is as important to New England as is the conservation of her soil, of her water power, and of her factories. This railroad service can only be conserved by having all who are interested in the welfare of New England fair, prudent, patient, and courageous enough to take a broad, far-sighted view of the whole situation.

No board of directors and no railroad executive can conserve railroad service without being prudent and fair themselves, and without fair and reasonable treatment and support of governmental bodies:—fair and reasonable attitude and support to the press and of the traveling and shipping public, and the great army of owners and employes. Unless all these classes are fair, sensible, without prejudice, patient and helpful each to the other, the best results, and the results that the public desires, cannot be obtained.

It has been my good fortune to have close and friendly relations with the communities served by the railroads with which I have worked, and with the officers and employes of those roads.

So far as I have the strength,—moral, mental and physical,—I shall work to have the same kind of relations between the New England Lines and the governing bodies, the public, the press, the employes, and the owners.

Every owner can do something in his own circle to understand the situation himself, and to help to create a friendly feeling and to give business to the company.

Every officer and employe can do a little more each day to make certain that he is wasting neither the company's time, nor its material, and that he is making the best and most effective use of the company's plant.

Every one with a real interest in the future of New England can do something to help by discussing calmly those failures and errors that are incident to a complicated piece of machinery, that is not yet completed, and that is operated by many thousands of men.

Criticism is expected, and fair criticism does good. Unfair attacks waste the mental energy of the officers and break down the esprit-de-corps of the army of employes.

This complicated situation demands the best effort and spirit of every officer and employe for every waking hour, in order to produce that service which the public asks for and should have if money can be obtained with which to produce it. And the rights of the owners must be respected and not lost sight of if the new money is to be obtained to make of the New England Lines what the owners and what the traveling public and the shippers want them to be:—a comprehensive and effective transportation machine.

Is it not a good time to act upon two of the maxims of Edward Everett Hale, that grand old New Englander: "Look forward and not back," and "Lend a hand?"

I believe that it is and that all should put animosities and prejudices behind them, sink self-interest, be willing to practice some self-denial, and work loyally to help the advancement of a greater New England, and her interests, of which her railroads are a most essential part.

I believe most thoroughly in the fundamental strength of the New England properties, in their ultimate ability to furnish the transportation needed by New England, and in the final good sense and fair judgment of the public. And I believe that the problems now presented to the management and to the public can, must, and will be solved.

I take up this work with a very solemn sense of duty to the owners of the property, to the people that are to be served, and to my family and to myself. If any experience, talent, strength, courage and judgment that I may have acquired in the West can be applied to making a better and more satisfactory transportation machine to serve the people of New England and to build up and be a part of a greater New England, and to bring a return to the many owners of its securities, I shall feel that I have done something to help, and be satisfied and gratified.

I shall give the best that is in me to the work, but I cannot do it alone, and must ask the loyal support of all.

I shall have offices in Boston, New Haven and New York, and my home will be in Boston, from which city I can reach quickly and readily all parts of the system, and confer with the different officers of the various lines, and discuss with them and with the public general questions of mutual interest.

It is a regret, both personal and official, that events have so shaped themselves that it appears to be my duty and obligation to leave the Northwest and Northern Pacific. For ten years I have worked closely with many loyal men, both in and out of the railroad service, trying to build up the Northwest. And it is a great wrench to sever my relations with those friends. I am glad to say that the Northern Pacific property never was in as good condition as it is now—or better organized and equipped to do its duty as a common carrier. I most earnestly hope that my successor will have the same loyal support that I have had.

How Can the Colleges and the Industries Co-operate?*

By Ivy L. Lee,
Executive Assistant, Pennsylvania Railroad.

Ivy L. Lee,
Executive Assistant, Pennsylvania Railroad.

THE college is both a training school and a laboratory. The industries of the world not only look to you to train men who can take up the work of directing and guiding great enterprise, but to a constantly greater extent, industries are looking to you to solve their broader problems. When President Taft wanted a man to report on what should be the proper system of charges on the Panama Canal, he sent Professor Emory R. Johnson, of the University of Pennsylvania, to make the inquiry. Some of the finest work in the study of the transportation question is being done by Professor W. Z. Ripley, of Harvard. The astonishingly able accounting analyses of Professor Henry C. Adams have been of priceless value to the Interstate Commerce Commission.

Right here, however, I would direct your attention to the point brought out in a conversation I once had with Mr. W. M. Acworth, the distinguished English railway economist, who, after returning to London a few years ago, from attendance upon a meeting of the American Economic Association, made this observation:

"I was surprised, hearing the college professors discuss the transportation question, to note how little they really knew of it. They understood the theory, but not the practice. And later, discussing the subject with many railroad presidents, I was astonished at their lack of breadth. They understood the practice, but few knew the theory."

And that, gentlemen, leads me to the chief thought I wish to present to this gathering. The demand of industry is for men who understand both the practice and the theory.

Let me be concrete. It is the experience of Pennsylvania Railroad officers that graduates who come to them from technical schools are deficient in three general particulars:

(1) Lack of practical experience and judgment,

(2) An idea that they are far superior to the rest of mankind; and

(3) A certain narrowness of mind, inculcated through too exclusive attention in college to mathematics and theoretical science, and a too great neglect of those broader subjects, such as political economy, history and general literature.

With your indulgence, therefore, I will make a few suggestions as to how these deficiencies may be met.

1. The question of practical experience might be remedied by the man serving two or three years as a machinist prior to going to a technical institute. Of course, this is not feasible in a large number of cases, and the man must get his actual experience after he starts regularly to work. But the college can implant in his mind certain sound fundamental ideas. A man who has had a good engineering education and has absorbed commercial ideas will make a good commercial engineer. One who is a theorist and scientific man only, with no commercial ideas, will make a good investigator, and possibly a good man in a test department, especially when engaged in scientific research; but even a good test department man requires some little idea of business, because test room questions are not settled on quality alone. The best quality for the same cost is the real question at issue. The man of great value to an industry is he who does not merely attempt to follow a theoretical ideal, but who adapts his theories to the actual limitations of the moment, and secures the best practicable result.

2. Men leaving technical institutions should be made to have a thorough understanding of the fact that they are necessarily almost completely lacking in a real knowledge of the practical application of the principles they have been studying. If a student can be trained by the time he completes his college course to have real openness of mind, he will be well on his way toward success when he leaves college. Young technically educated men leaving school should, at the start, forget that they are men of scientific training, and tackle work precisely as do other workmen, knowing that when they have mastered that part of their education, the time spent in doing so will not have been wasted.

While it is not expected that technical men entering railroad shops shall have to consume as much time on menial or trivial work as those not possessing such advantages, nevertheless, to regard time spent in the shops as time lost in the pursuit of their true vocation is a very grave mistake, and results in many technical men not being advanced to a position of managing other men.

It is of the greatest importance, too, that students be impressed with the human elements in

*—Note.—An address delivered before the annual meeting of the Society for the Promotion of Engineering Education, held at Minneapolis, Minn., June 26.

Digitized by Google

all industrial work; that is, they must realize that whatever their college education may have been, they are of very little real value until they have acquired something which few colleges teach. Too often young men come from our colleges with the feeling that they know too much to be told anything by men who have not had a college education. By assuming such a stand they close the mouths of men who could and would give them very useful information.

A beginner in the practical end of any line of work should be taught beforehand that college education is not everything, and that results can only be accomplished through other men. Therefore, he must get the viewpoint of other men before he can secure that sympathy from these other men on which his success as a manager will depend. In doing this he will get much misinformation, which he will know to be such, but this knowledge he should keep to himself. We see all around us men holding the highest positions, who have come up from very small beginnings, with no apparent advantages. Yet we find that these men have their business at their finger tips, because they have been through all of its grades. The feeling that the possession of an education relieves a man from the necessity of going into these details has resulted in many men becoming nothing but technical advisers to carry out the wishes of other men who thoroughly understand the details of their work. Such merely technical advisers never share in the great rewards which come to the men who combine a mastery of both theory and practice.

3. It is of prime necessity, of course, that a man who is trained to practice engineering shall have a good engineering education. Successful men in railway engineering work must necessarily be familiar with the laws of nature and the fundamentals of mathematics. This information can be obtained, however, outside of technical colleges, and the man who obtains his information in this manner, by the necessarily more concentrated application on his part, is generally a better engineer than a large percentage of college graduates. Many competent judges believe that technical courses in the majority of the colleges lay too much stress on details. If more time were spent on the study of fundamental principles, it would result in developing more resourceful men. Some of our officers, in advising young men, have suggested to them that they devote their entire time to the study of mathematics, physics, chemistry, English, and one foreign language, and not take up any particular branch of engineering. A student who is well grounded in the above studies can take care of any proposition which will come before him. His resourcefulness will be developed by reason of his being compelled to work from principles rather than trying to fit the problem before him to some particular detailed case which he has learned in his engineering course.

Many of our officers hold the view that the best shop work for college men is that which can be obtained during the summer in the various shops where actual work is done, rather than having the time of the student taken up by the more or less imitation shop work that is done at some of the schools. The most valuable part of shop experience to a student is the coming in contact with men and absorbing their experience.

I asked not long ago the man who, I believe, is conceded to be the greatest expert in this country in railway electrification, to tell me what he really learned at college. His reply was:

"I am inclined to think that the most valuable asset that I brought out of my college course was the habit of studious application to the job in hand rather than a finished knowledge of any subject."

In the final analysis the technical student has only time to acquire a fairly good grounding in principles of engineering. The college-trained man, however, has an immense advantage, after he obtains some experience, over the non-technical man in being able quickly to grasp the relation between the theory and practice, and to apply correct principles to practice.

I would urge that you not only see to it that students receive a broad general education, but that they be made to see that it is of great importance not to be in too big a hurry to commit themselves to a particular life work. College professors can be of great value to their students, and also to industries, by advising men frankly as to their limitations, and also as to their strong qualities. * * *

Young men are frequently placed in positions for which they are entirely unsuited, while if they were moved to other positions more adapted to their make-up, they would often prove successful. Some of the very best men in certain departments in our shops at Altoona can never go higher because there is nothing else that is suitable for them to do in general railroad work. In some of these cases no other men on the road could fill their present positions as well as they do. The only thing for such men to do is to leave the railroad and seek positions with concerns that can afford to pay more for the particular kind of ability which these men possess.

So much for suggestions as to how colleges can the better equip men for taking their part in building and directing our industries. You have all noticed, however, that this is a day of social service. Never before were so many men being called for to act for the people at large in the control of industry, and particularly transportation. The Interstate Commerce Commission has just advertised for a large number of engineers to assist in the pending federal valuation of railroads. Never did a situation more strikingly illustrate the need for men with practical training. If the proposed valuation is carefully and wisely made, it will do great good. As Mr. Thomas F. Woodlock said, in a most illuminating article in the New York *Times* Annalist of June "Partial confiscation—partial at least—of property actually invested in railroads will be quite possible by 'valuation' if the public is determined to do it, or if the 'valuers' are permitted to run riot among the technicalities." It is an occasion when practical men are needed, men capable of seeing facts as they are—and not with reference to any theories or past prejudices.

So men are being demanded for work with public service commissions, in colleges as teachers, in University Settlement and municipal health work, in city governments, and in all those capacities where men can serve their fellow creatures. This is one of the hopeful signs of our times. But this is a period of great unrest. Many strange economic and political theories are being preached. It is a time when our young men should see that things cannot be always as they should be, but that our duty is to make them as good as we can.

Digitized by Google

Railroad managers, for instance, would be delighted to equip every mile of road with automatic block signals, to make every car of all steel, to remove all grade crossings, and otherwise avail themselves of every device to insure safety. But this cannot be done without the necessary money. So in all things it is well to hitch our wagon to a star, but be sure that the connecting rope is long enough and elastic enough to let us keep the wheels on terra firma. We cannot go through life on an aeroplane.

The manager of every industry would be glad to allow his employes a short work day, and surround them with every comfort and luxury. But here again are limitations which must be regarded, and which it is of particular importance to have deeply embedded in the minds of the men you send out into the world to work and to direct the labor of other men. Amidst all the efforts for social betterment, and for adding to the general welfare of men, we are forced to realize the old fashoned doctrine that, in the long run, men can reap only as they sow. I leave with you, then, these lines of Kipling's:

"From forge and farm and mine and bench,
Deck, altar, outpost lone—
Mill, school, battalion, counter, trench,
Rail, senate, sheepfield, throne—

"Creation's cry goes up on high
From age to cheated age;
Send us the men who do the work
For which they draw the wage."

College Professors in the Work Shop

BELIEVING firmly in a closer co-operation between industrial and educational institutions, to the advantage of both, twenty-eight college professors representing the electrical engineering departments of twenty-six colleges are spending their vacations working side by side with the skilled mechanics and engineers of the Westinghouse Electric and Manufacturing Company at East Pittsburgh.

By taking this course, the professors are aiming to accomplish a fourfold object: to obtain a firsthand working knowledge of the methods of practical electrical engineering; to secure the opinions of successful engineers and manufacturers on the qualifications of men needed in industrial work, so that they may be taught accordingly and thereby be properly qualified for success in their chosen branches; an exchange of teaching ideas among themselves; a study of the industries of the Pittsburgh district.

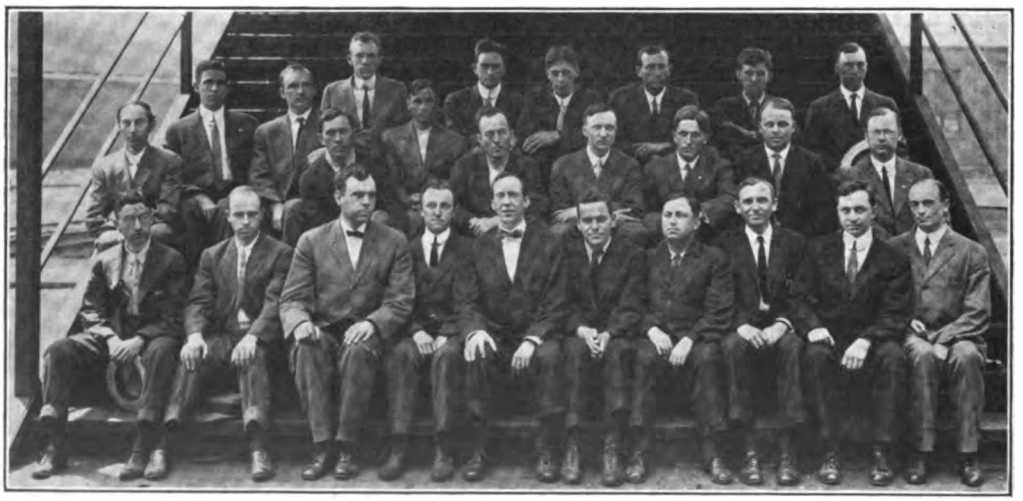
Many of these professors are heads of the departments in their respective schools and the average length of time spent in teaching is 5¼ years.

The professors are employed on the regular shop pay roll and conform to shop hours and regulations, receiving therefor a compensation of 22 cents per hour, or an average of $55 per month; the regular rate for second year apprentices.

The Westinghouse Electric and Manufacturing Company is a warm supporter of this movement of co-operation between the industrial and educational institutions, and has delegated its highest officials and engineers to meet with the professors and explain to them the work of the various departments of the big electric works; each phase being explained by an expert in his line.

At the close of working hours in the evening, these student-workmen, without stopping for dinner, get a lunch of sandwiches and coffee and proceed on a trip of inspection through the works, guided by shop foremen and superintendents, ending in a meeting for discussion of the points covered by the trip.

College professors are usually lacking in practical knowledge of works management and efficiency methods and it is hoped by this course



PROFESSORS OF VARIOUS PROMINENT COLLEGES WHO ARE SPENDING THEIR VACATIONS AT THE NEW WORKS OF THE WESTINGHOUSE ELECTRIC AND MANUFACTURING COMPANY, AT EAST PITTSBURGH, FOR THE SAKE OF THE PRACTICAL EXPERIENCE TO BE PROCURED.

Digitized by Google

to gain such a knowledge from close contact with such work and the men who direct it.

At the evening meetings, lectures are given by engineers, works-managers, foremen, and also educators from their own crowd and the educational institutions of the Pittsburgh district.

In such meetings and by close association with one another for a period of several weeks ideas are obtained and fully developed that prove of immense advantage in furthering the work in which they are engaged, that is, teaching electrical engineering.

The course opened and will also close with a dinner given by Westinghouse officials.

Prof. George B. Thomas, of Colorado College, has charge of the course and is looking after the details in addition to working himself. A complete schedule has been worked out covering the lectures and the industrial plants, one of which latter is visited each week.

The Living Wage and the Living Rate

NOTE.—The following article by Colonel Theodore Roosevelt, published in the July 5th issue of *The Outlook*, is significant. In this article Colonel Roosevelt does not directly advocate an increase in rates, but he does call attention to the unfortunate results which would follow a denial of rate increases should the carriers present a convincing case in favor of such increases. This is all the railroads desire. They are convinced that they can conclusively show the necessity for increased rates in order to maintain a progressive transportation plant, and that an impartial investigation by the proper authorities will bring the much needed relief.

RECENTLY certain railway men petitioned the Interstate Commerce Commission to be allowed to raise rates. It is announced that the Interstate Commerce Commission is to look into the case. This makes it opportune to say a word or two on the subject; for the ability of the honestly managed railways of the country to render good service to the public and to pay good wages to their employes ultimately depends upon there being a reasonable return to the honest investors, which means that the railways must possess a good earning power, which largely depends on the rates. The very big investor, like the very big shipper and the very high grade wage-worker, can usually get along somehow even under adverse conditions; but for the sake of the small or ordinary investor there is need of a living rate just as there is need of a living wage for the average workingman. The living wage and the living rate are interdependent.

There are railways which have been so foolishly or so corruptly organized and managed that it is impossible for investors in them to get adequate return for their investments; just as it would be impossible for them to do so if they had acted foolishly, or had been the victims of swindling, in connection with a dry goods store, or any other business enterprise. The public must not be expected to sacrifice its own interests and the interests of wage-workers in order to pay dividends on watered stock, or to secure promoters and managers against the consequences of their own folly. What I have to say does not concern railways of this stamp.

But it must be a cardinal principle in dealing with honestly built and wisely managed railways that the investor, the shareholder, is just as much entitled to protection as is the wage-worker, the shipper, or the representatives of the general public. Unless the investor finds that he is to get a fair return on his money, he will not invest, and in such case not only will not be able to repair the waste, the wear and tear, to which they are subject, and will not be able to make needed improvements. All governmental action, whether by the legislature or the executive, should be conditioned upon keeping in view this fact.

By actual experience it has been found that it is unsafe to leave the wage-worker, the shipper, and the general public, and furthermore that it is unsafe to leave the small investor himself at the

COL. THEODORE ROOSEVELT.

mercy of the big men who manage railways. But on certain points the interests of the big man and the small investor are identical. On certain other points the interests of both of them are identical with those of the wage-worker. On all points the only way of securing permanent justice to each class is by giving permanent justice to all classes. The public can be well served, and the wage-workers can be well paid, only if the railway is successful, that is, if there is such certainty of reasonable dividends as to make investors content, and therefore willing and desirous to invest in further developments and enterprises.

This is a sufficiently obvious fact, but it is a fact often in practice forgotten. In certain cases workmen's compensation laws and full crew bills are passed by legislatures at the same time that rates are reduced by commissions, or indeed sometimes by legislative enactment, until the property ceases to pay. Now a cardinal point made by all enlightened advocates of such laws as workmen's compensation and the like has al-

Digitized by Google

ways been that the burden is to be distributed through the corporation upon the public. Public service commissions are created for the very purpose of supervising, controlling, and regulating the activities of the railways so that they shall not only be obliged to treat their employes, the shareholders, and the general public fairly, but shall be guaranteed fair treatment themselves in return. Some railways are so remunerative that it is fair to reduce their rates at the same time that we increase their burdens. There are other railways as to which the only effective way to distribute the burden of payment for extra safety to employes and the public, and extra compensation to and care of the workers, is by rendering the service more remunerative; and this may of necessity means raising rates. It is just as much the duty of the Commission to permit rates to be raised when the raise is justifiable as to require them to be lowered if the lowering is justifiable. The Commission is created precisely because this is the kind of work it can and ought to do, and the kind of work that no legislative body could with wisdom perform. The Commission is no true servant of the public unless it unhesitatingly raises the rates when justice in the public interest requires such action, and unhesitatingly lowers the rates when this is the course which will ultimately best meet the public needs.

This is merely part of the general doctrine of administrative control of big corporations. The control should not be hostle to the corporation; it should merely be hostile to any misconduct on the part of the corporation, and it should protect the corporation against misconduct aimed at it exactly as it protects others from misconduct committed by it. Unless the corporation makes money—that is, unless business men are prosperous—there will be no money to give in proper wages for the wage-worker, there will be no money with which to provide for his protection and to insure him against loss and damage, and no money wherewith to render proper service to the customers and to the public as a whole. Whether the reward comes in the way of big salary to the big manager who makes the business a success, or of dividends to the big or small man who invests money in it, the principle is the same. Our purpose is to see that there is a proper division of prosperity. But there can be no division unless the prosperity is there to divide. One of the methods by which the prosperity will certainly be abolished is to draw the line against size and efficiency instead of against misconduct. Another way to destroy it is to impose burdens, however necessary and proper without facing the fact that some one must pay for the burdens, and that if the investor cannot pay for them and at the same time get a reasonable return on his investment, then either the business will close or the public must share the burden with the investor.

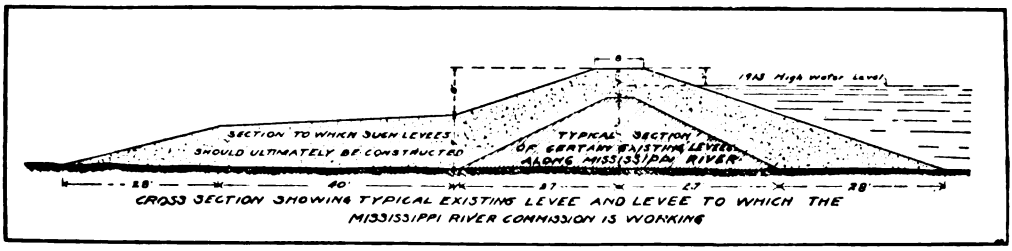
In the concrete case before us it is for the Commission to determine with strict justice to all parties how the relative and often conflicting demands of the shareholders, the wage-workers, the shippers, and the general public can properly be met. I am not discussing—I have not the knowledge which would warrant my discussing—whether the rates should be raised. If the facts do not warrant a raise, then the raise should not be permitted; but if justice and the interest of our people as a whole demand a raise in rates, then that raise in rates should unhesitatingly be authorized.

The Western Flood Problem

THE disastrous floods of 1913 have brought sharply to the attention of those concerned, the necessity of devising some better method of holding in check the waters of the Mississippi and its tributaries. The railways are particularly interested in the development of some effective plan, as they are always among the chief sufferers from flood disasters. Recently the United States Mississippi River Commission has been investigating the matter of levee construction and possible improvement, and A. S. Caldwell, president of the Mississippi River Levee Association, presents in *The Nation's Business* of July 15th, the following statement regarding the progress of the Commission's work:

"The sketch accompanying this article, shows a cross-section of a present typical Mississippi River Levee (shaded black) and of a properly constructed levee (dotted) as proposed by the United States Mississippi River Commission. The latter contains twice as much earth as the former and is twice as strong. The United States Mississippi River Commission estimates that these larger levees can be constructed from Cairo to the Gulf, at a cost of $58,000,000 and will afford complete protection against future overflows.

"The Mississippi River Levee Association favors the Humphreys-Ransdell bill. It provides for the appropriation of $60,000,000 over five years for the Mississippi River from Cairo to the Gulf on condition that $15,000,000 is contributed by the adjoining states for levees. $15,000,000 of Government funds is allotted to bank revetment for maintaining and improving navigation, and $45,000,000 to levees for flood protection. The nation having already expended $27,000,000 on levees, it will, if the appropriation



CROSS SECTION SHOWING TYPICAL EXISTING LEVEE AND LEVEE TO WHICH THE MISSISSIPPI RIVER COMMISSION IS WORKING

Digitized by Google

of $45,000,000 is made, have contributed $72,000,000 for flood protection against $75,000,000 by the States, viz.: $60,000,000 already spent and $15,000,000 required by this bill. An equal division of the cost of this great work between the Government and the States is all that fairness should require.

"It is the opinion of all civilian and United States engineers who have studied the subject, that a properly constructed levee system is the only feasible and economical method of preventing floods in the lower Mississippi River. This is also the opinion of the Mississippi River Commission which has had special charge of this part of the river for over thirty years.

"The Government Commission of 1860 reported, 'The plan of levees which has always recommended itself by its simplicity, can be relied upon for protecting all of the alluvial bottom lands liable to inundation below Cape Girardeau.' Another United States Commission in 1875 so decided.

"The Senate Committee of Commerce in 1898 declared: 'From all the evidence taken by your committee, it is evident that the basins along the Mississippi River can only be protected from floods by an ample and complete system of levees from Cairo to the Head of the Passes.'

"Colonel C. McC. Townsend, one of the ablest engineers in this country, was stationed in Memphis for over six years in charge of this section of the river; he also spent many years on other sections of the river and has investigated the levee system of foreign countries. In his Memphis speech he said: 'Levees have been tested for ages and have proved uniformly successful when built to adequate dimensions—no other method of relief from floods has been successfully applied to large streams.'

"The levees along the Rhine, the Danube, the Po and the Arno—all alluvial streams like the Mississippi—have prevented overflows for hundreds of years. So have the levees of Holland. We do not need to go to Europe for proof of levee efficiency.

"The levees of the Upper Mississippi District —100 miles long— were built higher and stronger than any others along the river and have not broken Even these are not what they should be, but they held the unprecedented waters of 1912 and 1913.

"In the 1,355 miles of levees on both sides of the river in the States of Arkansas, Tennessee, Mississippi and Louisiana, there were in 1913, only seven crevasses, measuring about five miles in length. This should prove the present levees to be of great value, and that levees twice as strong will be efficient.

"Among engineers there seems to be unanimity in protesting against the construction of flood-water reservoirs in the Mississippi Valley.

"In his speech of April 11, 1913, before the National Drainage Congress in St. Louis, Colonel C. McC. Townsend said: 'To have retained the Mississippi flood of 1912 within its banks would have required a reservoir in the vicinity of Cairo, Ill., having an area of 7,000 square miles, slightly less than the State of New Jersey, and a depth of about 15 feet; the quantity of material to be excavated in its construction would be over 100 billion cubic yards and its estimated cost from 50 to 100 billions of dollars. Such a volume of earth would build a levee line 7,000 miles long and over 150 feet high.'

"The United States Senate Commerce Committee in 1898 reported, 'The cost of constructing and maintaining a system of reservoirs would be enormous and far greater than the cost of leveeing the entire river basin. This scheme is regarded by engineers as wholly impracticable. Your committee can discover no just or adequate relief in reservoirs.'

"The protection of the alluvial lands of the Lower Mississippi River from overflow and the addition of this vast territory to the productive area of the United States, is now generally conceded to be a national duty. The three great political parties embodied resolutions to this effect in their 1912 platforms, and their candidates so declared."

The Struggle for Greater Railway Safety

THE Pennsylvania Railroad has recently issued a pamphlet in which is described in a most interesting manner the struggle in which this great system is constantly engaged in providing the ultimate of safety both for its patrons and employes. In view of the recognized enterprise of this system and its desire and ability to provide and maintain the best methods for the transportation of both passengers and freight, the following paragraphs taken from the pamphlet referred to are of more than ordinary interest:

NEARLY five hundred million passengers—one-third of the population of the globe—have been carried by the Pennsylvania Railroad in the past five years, and sixteen of them lost their lives in accidents to trains, nine having been killed in one accident. Thus, in five years, only five trains out of over 4,000,000 operated suffered wrecks which caused the death on any of them the passengers carried on them.

The record of the Pennsylvania Railroad Lines East of Pittsburgh for passengers killed in train accidents in the past five years is as follows:

Year.	Passengers carried.	Train accidents in which passengers were killed.	Passengers killed in train accidents.
1908	88,328,604	0	0
1909	92,391,356	1	1
1910	100,844,477	0	0
1911	97,978,839	2	11
1912	101,755,061	2	4
	481,298,337	5	16

Out of 61,443 men employed in train service on the Pennsylvania Railroad East of Pittsburgh, 119 were killed in 1912. Of this number, but 17 were killed in accidents to trains, freight and passenger. The records show that but an infinitesimal proportion of accidents to employes occur on passenger trains.

There were some 68,000 men employed in shops and on the tracks in 1912; of this number, 166

GIVING A STEEL CAR A BAPTISM OF FIRE.

To test the security of a steel car against fire, 200 pounds of shavings and wood, saturated with oil, were burned in this solid steel passenger car, causing damage only to the paint and upholstery. The Pennsylvania Railroad in 1906 announced that thereafter only all-steel cars would be added to its passenger equipment. No wooden passenger cars have been built since that time.

were killed as a result of accidents, none of which was a train wreck.

In other words, while 285 train, track and shop employes of the Pennsylvania Railroad were killed in 1912, but 17, or about six per cent, of them were killed in accidents to trains. The other deaths were due to trespassing, to carelessness, and, in some instances, to defects of shop machinery and other avoidable causes.

Freight trains were operated on the Pennsylvania Railroad East of Pittsburgh for a total distance of 32,114,305 miles in 1912. As passenger trains ran over 40,000,000 miles, all trains covered a total of more than 72,000,000 miles—and 21 people, four passengers and seventeen employes, were killed in accidents to trains.

On the doctrine of averages, fourteen trespassers will be killed by American railroads to-morrow. An average of fourteen people, trespassers on railroad property in violation of the law, are killed in this country every day. Of all the 10,446 people killed on American railway property in 1912, 5,449—more than half—were trespassers.

But it is a mistaken idea that all trespassers are tramps. To find out really the class of people who trespass on railroad property in violation of the law, and in the face of probable death, the Pennsylvania Railroad conducted an exhaustive investigation of every case where a trespasser was killed or injured last year. The records show that only about one half of the 267 trespassers killed and the 276 injured on the Lines East of Pittsburgh were classed as "unidentified, mostly tramps." The others were useful citizens.

All trespassers' deaths which occur on the Pennsylvania Railroad are classified in the Interstate Commerce Commission reports as "killed in railway accidents."

Among the 267 people who lost their lives while trespassing on Pennsylvania Railroad property were blacksmiths, farmers, carpenters, a cemetery sexton, clerks, a coal dealer, employes of other railroads, glass workers, laborers, a mail carrier, miners, a slack wire performer, a sailor, steel workers, students, a superintendent of a gas well, a soldier, and others from probably a dozen more vocations.

While only figures from the Pennsylvania Lines East of Pittsburgh have been analyzed, complete returns from every one of the roads of the System show that 490 trespassers were killed in 1912. The System's reports for the last thirteen years show 9,013 trespassers killed and 8,777 injured. The records for the past six years are as follows:

ACCIDENTS TO TRESPASSERS.

Year.	Killed.	Injured.	Total killed and injured.
1907	916	775	1691
1908	743	691	1434
1909	633	683	1316
1910	585	582	1167
1911	527	447	974
1912	490	492	982
	3894	3670	7564

The above figures are pointed out as emphasizing the contention of the railroads that laws should be enacted providing substantial punishment for persons trespassing on the private right of way of any railroad.

The renewed and diligent efforts the Pennsyl-

THE SKELETON OF AN ALL-STEEL CAR.

This shows the structure of an all-steel car with its heavy steel backbone—a protection against damage by collision. Some 2872 solid steel passenger cars—probably half the steel passenger cars in the United States—are in service on the Pennsylvania System. They represent an expenditure of $40,000,000. The total passenger equipment of the system is 6252 cars.

REPLACING WOODEN BRIDGE WITH CONCRETE.

SIGNALS AT WASHINGTON STATION.

One of the most perfect signal installations yet devised is that which protects the network of tracks at Washington Terminal.

vania Railroad is making to stop trespassing will be measurably influential, the management believes, in arousing the public to a realization that in accidents to trespassers it is the individual who loses his life, than which there can be no greater sacrifice. Society loses the individual.

The loss to the nation in the money value of human lives sacrificed in trespassing is most serious. It is a constant and continuing drain—one which the railroad, unsupported by active public sentiment, is powerless to stop.

The management of the company regards every accident of any kind on the property of the Pennsylvania Railroad as one too many. The number of accidents is too large; it must be cut down. To that end efforts are being directed more definitely and systematically than ever before.

The greatest problem the railroad has to solve in its efforts to conserve life is to find ways to protect those who won't protect themselves. Unfortunately, passengers, trespassers and employes continue to take chances with death, and the railroad is throwing as many barriers as possible in the way of their risking their own lives, as well as the lives of others.

Employes who knowingly take chances of injuring or endangering either themselves or their fellows are disciplined now, even though no one is hurt. To get at such cases, "surprise tests" of obedience to rules are conducted among all classes of employes. These are held at unexpected times and under unusual conditions, so that they reveal just to what extent rules are broken and risks taken.

Records of tests made in 1912 give an excellent indication of the hearty support employes are giving the safety movement.

Of all the 1,134,715 tests reported, 99.8 per cent showed perfect compliance with all rules, but the remaining two-tenths of one per cent represents 2,216 cases that might have resulted in accidents.

It is further to insure the safety of employes and the public that these tests are conducted. If the lives and limbs of passengers and employes are to be protected, every employe who has anything to do with shop practice, with maintenance of way, or with the operation of trains, must refrain from violating rules, or even taking chances of accidents. These tests are not confined to any class of employes. Trackmen, station men, trainmen, and clerks are all checked up with a view to adding every possible precaution against accident, while at the same time improving the efficiency of operation.

While the relative number of accidents on the Pennsylvania Railroad may not seem large when the mileage of the railroad and the heavy traffic hauled is considered, nevertheless the company has set out to reduce not only the relative number of accidents, but to eliminate them as far as possible.

In the past two years machinery has been safeguarded, tracks have been re-posted against trespassing, and some $300,000 has been expended in carrying out recommendations of safety committees of employes.

In the past year an investigation has been made of every accident that occurred on the Pennsylvania Railroad, whether it was the case of a woman tripping on station steps, or the derailment of a passenger train. These accidents have been

Digitized by Google

addition to return on net capitalization being 1.74 per cent in the former case and 2.12 per cent in the latter. The actual net return on railroad capital in 1912 was somewhat less than 5.8 per cent; the net amount paid in dividends and interest, all duplications due to intercorporate holdings of securities being eliminated, was less than five per cent.

The excess consumption of revenue by taxes, comparing 1912 with 1880, is equivalent to placing on the railroads a lien of $882,240,000 of five per cent securities taking precedence of their first mortgage bonds. Comparing 1912 with 1900 the excess represents a lien of over $500,000,000, and comparing with 1905 it represents a lien of over $616,000,000. In other words, had taxes grown in no greater ratio than gross revenue, capital to one or another of the amounts stated could have been readily obtained to finance the betterments and developments so urgently called for by the increasing multiplication of the traffic.

The tax question may be studied at closer range by reducing revenues and taxes to the per mile of road basis and comparing the results. This is done in the following table. The last two columns are the most instructive. They show to what extent the requirements of taxation have consumed and are consuming progressively increasing proportions of both gross and net revenue from railroad operation.

	Gross per Mile.	Net per Mile.	Taxes per Mile.	Ratio of Taxes to Revenues. Gross. P. C.	Net. P. C.
1880.....	$ 7,307	$2,872	$158	2.16	5.50
1885.....	6,206	1,996	169	2.72	8.47
1890.....	6.829	1,974	189	2.77	9.57
1895.....	6,097	1,584	220	3.61	13.88
1900.....	7,827	2,267	252	3.22	11.12
1905.....	9,801	3,181	297	3.03	9.34
1910.....	11,512	3,955	444	3,86	11.23
1911.....	11,427	3,865	467	4.09	12.08
1912.....	12,230	4,076	494	4.04	12.12

After 1880, owing to great over-construction of railroads and consequent reckless competition for business, traffic rates shrank so much, and with them the per mile revenue, that the rapid multiplication of the traffic, doubling in volume about every ten years, did not enable the railroads to recover their lost ground in per mile gross revenue until about the end of the last century, nor in per mile net revenue until a few years later. Compared with 1880 the per mile gross revenue for 1900 shows an increase of $520, while the per mile net revenue shows a decrease of $605. Taxes increased steadily year by year, their growth for the period amounting to $94 per mile. They consumed $18.08 of every $100 added to the gross revenue, and increased to $701 per mile the falling off in net return available for capital. The total falling off in net return, computed on the basis of mileage operated in 1900, was $134,395,262—say 1½ per cent on the net capitalization of 1900. Taxes contributed 13.42 per cent, or $18,035,028, to this lowering of railroad credit —the amount contributed being about one-fifth of one per cent on the net capitalization or five per cent on a capital of $360,700,000.

Since 1900 the consumption of gross revenue by taxes has not been so heavy relatively as in the previous 20-year period, amounting for the thirteen years of the present century to about $5.50 out of every $100 added to the revenue. Also the extra consumption of net revenue has been largely offset by the operating economies which in 1900 began to be practiced universally by the railroads, and which were particularly effective in the years before the panic; consequently it has never since assumed so threatening an aspect as in 1895. But it promises to equal or exceed that record within the next few years unless the appetite of the tax ogre is curbed. Since 1900 net revenue has increased $1,809 per mile and taxes $242 per mile, the rate of increase being about 80 per cent in net revenue and about 96 per cent in taxes. In other words, taxes have consumed during the period $13.38 of every $100 added to the net revenue whether through natural increment or through operating economies.

In the country at large the rate of taxes paid by the railroads on the assessed value of their property is more than twice as great as the rate on all property. We tax them as private concerns and regulate them as public highways. We catch them both coming and going. On one side the growth of their revenue is restricted by regulation of the rates they may charge for transportation and on the other a progressively increasing proportion of the same revenue is consumed by taxation. In effect it is as if the net return on capital were being gradually extinguished by process of amortization. Net return governs railroad values and directly influences capital seeking investment. During the last six years it has been virtually impossible for the railroads to get sufficient money for their necessary extensions, improvements and developments.

More than 80 per cent of the taxes are levied on railroad values, mainly property values, and of course, these have increased and are increasing prodigiously. But the growing disproportion between the tax requirements and the available revenue has a tendency to retard the growth of values or even to cause a shrinkage of values. Thus the legitimate purpose of taxation is likely to be defeated, and what is vastly more important, the scaring of capital is likely to halt the progress of the nation.

The right to regulate carries with it the duty to protect. Regulation and taxation are looked after by different bureaus or departments of government. It should not be hard to get them together, in the interest of the square deal, and to have them agree on a plan of rate regulation and taxation that would operate more consistently and equitably than the present incongruous system does. Taxes must be raised, but they should be regulated by the ability to pay. That is to say, whenever increase in taxation becomes necessary, a corresponding increase in the ability to meet the charge—in the case of the railroads, higher transportation rates—should be authorized.

As the railroads by consolidation and expansion have assumed more and more an interstate character they call for interstate equality of taxes and for congruity of tax methods between the States. If the taxing power, so far as it relates to railroads, were centered in a national board under some agreement that would make up to the States for the right surrendered, the situation would be vastly improved. Working in unison with the Interstate Commerce Commission, such a board could be depended upon to give to Caesar what belongs to Caesar without unduly penalizing the railroads.

The Commission's Statistics of Steam Railways for the Year Ending June 30, 1912

THIS abstract is based upon compilations covering the fiscal year ended June 30, 1912, made from the annual reports of carriers having gross operating revenues of $100,000 or more for the year and also of railway companies owning property operated by the same carriers under lease or other agreement, which have been made in advance of the completion of the Twenty-fifth (or 1912) Annual Report on the Statistics of Railways in the United States. The omission of returns for small roads (having operating revenues below $100,000) prevents the showing of items comparable with complete figures for 1911. None of the statements include returns for switching and terminal companies. The figures given in the abstract may be somewhat modified by revision before they are presented in the full report for 1912.

Mileage.

On June 30, 1912, the roads covered by this abstract represented 240,238.81 miles of line operated, including 10,824.60 miles used under trackage rights. The aggregate mileage of railway tracks of all kinds covered by operating returns for these roads was 360,714.24 miles. This mileage was thus classified: Single track, 240,238.81 miles; second track, 24,929.51; third track, 2,511.76; fourth, fifth, and sixth tracks, 1,783.97; yard track and sidings, 91,250.19. These figures indicate, for the roads under consideration, an increase of 8,925.52 miles over corresponding returns for 1911 in the aggregate length of all tracks, of which increase 3,167,43 miles, or 35.49 per cent, represent yard track and sidings.

Equipment.

It appears, from the annual reports submitted to the Commission by the roads covered by this abstract, that there were 61,250 locomotives in their service on June 30, 1912, an increase of 979 over corresponding returns for such roads for the previous year. Of the total number of locomotives, 14,206 were classified as passenger, 36,600 as freight, 9,475 as switching, and 969 were unclassified.

The total number of cars of all classes in the service of such roads was 2,368,658 (or 25,245 more than on June 30, 1911), which equipment was thus assigned: Passenger service, 50,606 cars; freight service, 2,203,128; company's service, 114,924. The figures given do not include so-called private cars of commercial firms or corporations.

Of freight service, there were classified 2,202,966, as follows:

Description	Number.	Aggregate capacity. Tons.
Box	1,002,461	35,975,288
Flat	146,050	4,990,706
Stock	76,392	2,333,976
Coal	852,720	36,588,734
Tank	7,795	310,348
Refrigerator	30,681	950,530
Other cars in freight service	86,867	3,498,287
Total	2,202,966	82,647,959

It appears that the average number of locomotives per 1,000 miles of line was 255, and the average number of cars per 1,000 miles of line, 9,860. The number of passenger-miles per passenger locomotive was 2,263,019, and the number of ton-miles per freight locomotive was 7,077,428.

The returns indicate that the number of locomotives and cars in the service of the carriers under consideration aggregated 2,429,908, of which 2,410,440, or 99.20 per cent as against 99.01 per cent in 1911, were fitted with train brakes, and 2,425,265, or 99.81 per cent as against 99.77 per cent in 1911, were fitted with automatic couplers. Of the 2,203,128 cars in freight service on June 30, 1912, the number fitted with train brakes was 2,194,694 and the number fitted with automatic couplers was 2,199,301.

Employes.

The total number of persons reported as on the pay rolls of the steam roads of the United States on June 30, 1912 (not including those in the employ of the roads the gross operating revenues of which were reported as less than $100,000 or those in the service of switching and terminal companies) was 1,699,218, or an average of 707 per 100 miles of line. As compared with corresponding returns for June 30, 1911, there was an increase of 45,987 in the total number of such railway employes. There were 63,558 enginemen, 66,408 firemen, 49,051 conductors, 135,959 other trainmen, and 39,530 switch tenders, crossing tenders, and watchmen.

The complete report will include summaries showing the average daily compensation of 18 classes of employes for a series of years and also the aggregate amount of compensation reported for each of the several classes. The total amount of wages and salaries reported as paid to railway employes during the year ended June 30, 1912, for the roads under consideration was $1,243,113,172.

Capitalization of Railway Property.

On June 30, 1912, according to the annual reports submitted to the Commission by roads having gross operating revenues of $100,000 or more, together with returns made in reports filed of their non-operating subsidiary lines, the par value of the amount of railway capital outstanding was $19,533,750,802. This amount includes capital held by the railway companies concerned, as well as by the public. Of the total amount of such capital outstanding there existed as stock $8,469,560,687, of which $6,882,813,008 was common and $1,586,747,679 was preferred; the remaining part, $11,064,190,115, representing funded debt, consisted of mortgage bonds, $8,019,700,886; collateral trust bonds, $1,279,128,266; plain bonds, debentures, and notes $1,067,567,350; income bonds, $263,441,054; miscellaneous funded obligations, $116,170,300; and equipment trust obligations, $318,182,259.

Of the total capital stock outstanding for the roads under consideration, $2,909,693,873, or 34.35 per cent, paid no dividends. The amount of dividends declared during the year (by both operating and non-operating companies represented in this statement) was $400,432,752, being equivalent

Digitized by Google

to 7.20 per cent on dividend-paying stock. The average rate of dividends paid on all stocks outstanding pertaining to the roads under consideration was 4.73 per cent. No interest was paid on $808,404,701, or 7.52 per cent, of the total amount of funded debt outstanding (other than equipment trust obligations).

Investment in Road and Equipment.

The figures presented under this caption include returns for investment in road and equipment, shown by the operating roads covered by this abstract, as well as by their subsidiary non-operating roads (leased, operated under contract, etc.). The expenditures for additions and betterments, as well as the expenditures for new lines and extensions, during the fiscal year 1912 are analyzed in the following tabular statement:

Investment to June 30, 1912			$15,895,657,969
Investment to June 30, 1911			15,518,264,612
Increase 1912 over 1911			$377,393,357
	Expenditures for additions and betterments.	Expenditures for new lines and extensions.	
From cash or other working assets	$187,976,646	$59,872,304	
From special appropriations	32,553,291	183,613	
Through issue of securities	113,592,193	124,498,432	
Unassigned	2,134,855	3,554,933	
Total	$336,256,985	$188,109,282	
Total expenditures during year			$524,366,267
		Credits.	
Property retired or converted		$67,371,604	
Adjustments		17,290,466	
Difference between record value of grantor and purchase price of grantee in case of roads sold, merged, consolidated, etc.		62,310,840	
Total			146,972,910
Net increase during year			$377,393,357

Public Service of Railways.

The number of passengers carried during the year ended June 30, 1912, by roads represented in this abstract was 994,158,591. The corresponding number for the year ended June 30, 1911, was 987,710,997. The increase in the number of passengers carried during the year over corresponding returns for 1911 was 6,447,594.

The passenger mileage, or the number of passengers carried one mile, reported by roads represented in this statement, was 33,034,995,806. The corresponding return for 1911 was 73,465,336 more. The number of passengers carried one mile per mile of road was 139,356, as against 142,859 for the preceding year.

The number of tons of freight reported as carried (including freight received from connections) by roads represented in this statement, for the year ended June 30, 1912, was 1,818,232,193, while the corresponding figure for the previous year was 1,753,189,939, the increase being 65,042,254.

The ton mileage, or the number of tons carried one mile, as reported by the carriers under consideration for the year ended June 30, 1912, was 262,955,605,123. The corresponding ton mileage as reported for the year ended June 30, 1911, was 253,456,389,237, from which it will be seen that the increase in the ton mileage for the year ended June 30, 1912, over the returns for 1911, as applying to the roads represented in this abstract, was 9,499,215,886. The number of tons carried one mile per mile of road for the year ended June 30, 1912, was 1,108,578, as against 1,088,314 for the preceding year. The average number of tons of freight per train-mile was 409.29. The corresponding figure for the preceding year was 380.17.

The average receipts per passenger per mile, as computed for the year ended June 30, 1912, for the roads covered by this statement, were 1.985 cents; the average receipts per ton per mile, 0.743 cent. The passenger service train revenue per train-mile was $1.30.404; the freight revenue per train-mile was $3.04.015. The average operating revenues per train-mile were $2.30.201. The average operating expenses per train-mile were $1.59.544. The ratio of operating expenses to operating revenues was 69.30 per cent.

Revenues and Expenses.

It should be noted that, as in the case of other figures in this abstract, the revenues and expenses shown below exclude returns for roads the gross operating revenues of which were less than $100,000 for the year. The operating revenues of the railways in the United States for the year ended June 30, 1912, herein represented (average mileage operated 237,809.09 miles) were $2,826,917,967; their operating expenses were $1,958,963,431. The corresponding returns for 1911 (average mileage operated 234,366.14 miles) were: Operating revenues, $2,772,733,828; operating expenses, $1,901,399,475. The following figures present a statement of the operating revenues for 1912 in detail:

Freight revenue	$1,956,802,927
Passenger revenue	657,422,999
Excess baggage revenue	7,473,128
Parlor and chair car revenue	658,800
Mail revenue	50,674,758
Express revenue	72,970,758
Milk revenue (on passenger trains)	8,323,683
Other passenger revenue	5,228,969
Switching revenue	29,331,726
Special service-train revenue	2,078,910
Miscellaneous transportation revenue	6,174,062
Total revenue from operations other than transportation	27,367,678
Joint facilities—Dr.	918,586
Joint facilities—Cr.	3,328,155
Total operating revenues	2,826,917,967

Digitized by Google

Operating expenses, as assigned to the five general classes, were:

Maintenance of way and structures	$363,495,583
Maintenance of equipment	448,303,785
Traffic expenses	60,568,586
Transportation expenses	1,013,340,697
General expenses	73,254,780
Total operating expenses	1,958,963,431

With minor eliminations from the figures given above, operating revenues per mile of line operated (including line operated under trackage rights) averaged $11,881 and operating expenses $8,234 for the year.

Condensed Income Account and Profit and Loss Account.

There is given below a condensed income account and profit and loss account of operating roads, the gross operating revenues of which were $100,000 or more for the year ended June 30, 1912. A similar statement follows for non-operating roads (leased, operated under contract, etc.) controlled by the operating roads described. The statements omit returns for a few roads, the reports of which were not sufficiently complete for inclusion therein. The accounts of the operating roads include both operating and financial transactions, while the accounts of the non-operating roads are confined for the most part to receipts and payments under leases, contracts, and agreements. For a number of items, such as dividends, taxes, etc., both statements must be taken into consideration in order to learn the aggregates of such items for the railways of the United States therein represented. Thus the aggregate of dividends declared during the year, $400,308,609, includes those declared out of current income and those declared from surplus both by the operating roads and by the non-operating roads. This amount includes dividends declared on railway capital stock owned by other railway companies.

The complete report will include a summary showing the total taxes and assessments of the railways of the United States by States and Territories; also an analysis showing the bases of assessment.

Personal

B. L. Winchell.

B. L. WINCHELL has resigned as one of the receivers of the St. Louis and San Francisco, to become director of traffic of the Union Pacific system, with headquarters at Chicago. The change became effective on July 14th.

While Mr. Winchell's jurisdiction will extend over the entire Union Pacific system, he will have no official title on the San Pedro, Los Angeles and Salt Lake because the Union Pacific owns only a half interest in this road. He will, however, act in an advisory capacity regarding traffic matters to the officers of the Salt Lake Route, which will become under the new conditions a more important factor in transcontinental business than it has been heretofore.

Mr. Winchell began railway work in July, 1874, as a clerk in the office of the superintendent of machinery of the Hannibal and St. Joseph. He was subsequently clerk in the auditor's office of that road, chief clerk in the general freight and ticket office of the Atchison and Nebraska, and assistant general passenger agent of the latter road until April, 1880, when he was made chief clerk in the general passenger department of the Kansas City, Ft. Scott and Gulf and the Kansas City, Lawrence and Southern Kansas. Three months later he was advanced to assistant general passenger and ticket agent of those roads, and from June, 1882, to May, 1895, he was assistant general passenger and ticket agent of the Kansas City. Ft. Scott and Memphis and the Kansas City, Memphis and Birmingham. He was then for three years general passenger and ticket agent of the Union Pacific, Denver and Gulf and the Denver, Leadville and Gunnison. On May 1, 1898, Mr. Winchell went to the St. Louis and San Francisco as general passenger agent, resigning in December of that year to become vice-president of the Coloreda and Southern. He returned to the Kansas City, Ft. Scott and Memphis system in October, 1900, as president and general manager, and in August, 1902, he was made vice-president and general manager of the St. Louis and San Francisco system. In October of the following year he was chosen first vice-president of the St. Louis and San Francisco system, third vice-president of the Chicago, Rock Island and Pacific, and vice-president of the Chicago and Eastern Illinois and Evansville and Terre Haute. He was elected president of the Chicago, Rock Island and Pacific in April, 1904, and on December 1, 1909, was made president of the St. Louis and San Francisco lines and the Chicago and Eastern Illinois, which position he held until his recent appointment as one of the receivers of the St. Louis and San Francisco.

B. L. WINCHELL.

William C. Nixon.

WILLIAM C. NIXON, receiver and chief operating officer of the St. Louis and San Francisco Railroad, with headquarters at St. Louis, is one of the forceful type of men who

Digitized by Google

W. C. NIXON.

have by their own ability worked their way to the top rung of the ladder. Mr. Nixon is considered to be one of the most efficient and broad-gauged railroad officials in t..e country.

Mr. Nixon was born February 15, 1861, at Earlville, Ill. His father, William Nixon, was a lawyer of that place, and his mother was Sarah (Musselman) Nixon.

His education was obtained at the public schools of Washington, Illinois. At an early age he began work. His first railroad experience being as a bridge carpenter in 1878, for the B. and M. Railroad in Nebraska. He then entered the service of the Atchison-Topeka and Santa Fe Railroad at Emporia, Kans., as night watchman for a year, and then became clerk for a year at the station at Albuquerque, New Mexico. His next promotion was agent at Las Cruces, N. M., afterwards holding position of agent at Albuquerque, subsequently becoming chief clerk for the division superintendent, San Marcial, N. M. In 1885 he was advanced to train master of the Southern Kansas Railway, remaining in that position until 1889, when he was transferred to Kansas City as superintendent of terminals there, remaining in that office for one year.

He next became superintendent of the Chicago Division, and next superintendent of terminals in Chicago until July 1, 1896, and for the succeeding six months was general agent, freight department, located at Chicago. The next three years he was superintendent of the lines between Chicago and Kansas City and in 1900 was transferred to Galveston as general superintendent of the Gulf, Colorado and Santa Fe Railroad, which position he held until 1902, and was vice-president and general manager of the Gulf, Colorado and Santa Fe until July 31st, 1906, when he was appointed vice-president and general manager of the Frisco Lines.

In May 1, 1911, Mr. Nixon was appointed senior vice-president of the Frisco, and May 27, 1913, he was appointed chief operating officer under the receivership. July 14, 1913, he was appointed receiver and chief operating officer.

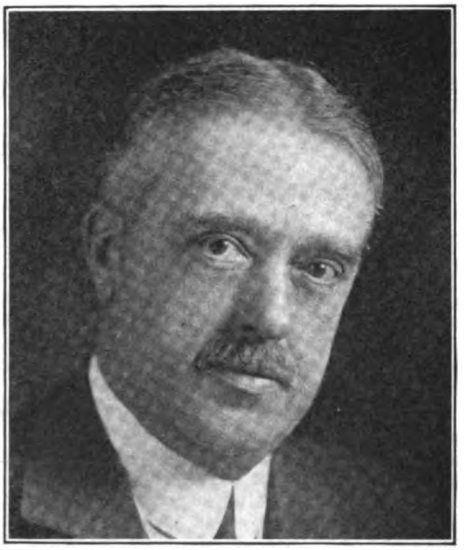
Mr. Nixon is a member of the St. Louis Club, the Noonday Club, and Mercantile Club of St. Louis, also of the Pickwick Club of New Orleans, the Aziola Club of Galveston, and the Dallas Club of Dallas.

He was married September 13, 1891, to Hettie E. Pitcher, of Brooklyn, Mich., and they have one son, Jack Nixon.

William B. Biddle.

WILLIAM B. BIDDLE, receiver and chief traffic officer of the St. Louis and San Francisco Railroad, is recognized throughout the United States as one of the most able and efficient traffic men in this country.

Mr. Biddle served in his early railroad career as station agent for the Santa Fe Railroad at Emporia, Kans. He was later appointed division freight agent at Albuquerque, N. M., and afterwards assistant general freight agent at Topeka, Kans. He culminated his career with the Santa Fe as freight traffic manager with headquarters at Chicago, in 1905, when he left its service to become vice-president of the Rock Island Railroad, which position he held until 1909, when he came to the St. Louis and San Francisco.



W. B. BIDDLE.

May 27, 1913, under the receivership of the St. Louis and San Francisco Railroad, Mr. Biddle was appointed chief traffic officer and July 14, 1913, he was appointed receiver and chief traffic officer.

Alexander Robertson.

ALEXANDER ROBERTSON, late president of the Western Maryland, has been selected by President B. F. Bush, of the Missouri Pacific-Iron Mountain system, to be his assistant in place of Finley J. Shepard, resigned. The appointee is familiar with this territory, having worked in this section for a number of years, and his appointment will be received with great favor by the officials and employes, as he is a man of wonderful personal popularity with all who have worked with or for him. In fact, one of the striking elements of his success has been his enjoyment of the complete confidence of his men and

Digitized by Google

ALEXANDER ROBERTSON.

his unfailing fairness in treating with them. He is a strong believer in promoting to vacancies men from the ranks.

Alexander Robertson was born in Albany, N. Y., in 1860, and began his railroad career with the Fitchburg road in 1885. He has worked his way from the ground up, and in 1897 went to the Wabash, on which railroad he was serving as superintendent when in August, 1903, he was made manager of operations of the Western Maryland and the West Virginia Central and Pittsburgh railways, which were then separate properties, but have since been consolidated. The Terminal Railroad Association of St. Louis in looking for a man to take charge of their operations during the heavy traffic that it was known the World's Fair would develop, selected Mr. Robertson as the right party and appointed him general manager. The remarkable success with which he handled that traffic has been commented upon in most complimentary terms by railroad men in all sections of the country. In November, 1905, the Western Maryland, whose properties had then been unified, selected him as their general manager in charge of both transportation and traffic, and in March, 1907, he was elevated to be vice-president of the company. When Mr. B. F. Bush, the president of the Western Maryland, was selected to head the Missouri Pacific-Iron Mountain system in April, 1911, Mr. Robertson was chosen by the directors to be his successor. He resigned last January.

Joseph T. Richards.

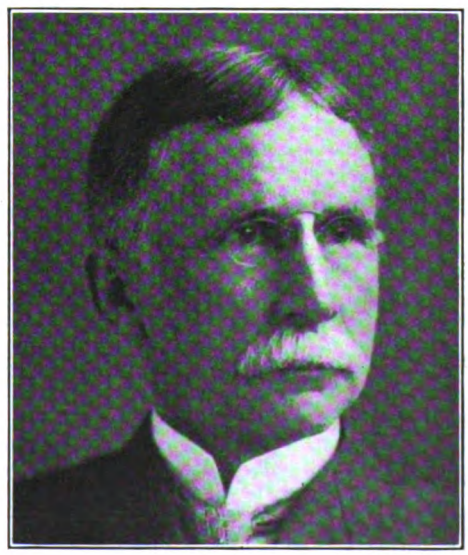
JOSEPH T. RICHARDS, recently appointed consulting engineer of maintenance of way, of the Pennsylvania Railroad, was born near Rising Sun, Cecil County, Md., on February 12, 1845. He was educated largely at the West Nottingham Academy, in Cecil County, Md.

Mr. Richards entered the service of the Pennsylvania Railroad Company in August, 1869, as rodman and transitman, during the construction of new shops at Altoona. On June 1, 1870, he was appointed supervisor from Harrisburg to Newport in which position he continued until October 16, 1871, when he accepted the position of chief engineer in locating and constructing minor railroads in Maryland. After completion of the Kent County Railroad he was made superintendent, auditor and secretary. On March 1, 1873, he became chief of locating engineers for several surveys over the Allegheny Mountains for an outlet for the Bedford and Bridgeport Railroad.

On May 25, 1874, Mr. Richards accepted the position of mining engineer with the Cambria Iron Company. He returned to the service of the Pennsylvania Railroad Company on March 1, 1875, as supervisor of Division No. 6, of the Main Line, extending from Newport to Granville. On March 20, 1876. he was promoted to assistant engineer, maintenance of way, of the Pennsylvania Railroad. From June, 1877, to March, 1883, he was principal assistant engineer of the United Railroads of New Jersey Division, and from March, 1883 to June 24, 1885, assistant to the chief engineer. On the last mentioned date he was appointed by the president assistant chief engineer.

On March 1, 1893, when a change was made in the organization, Mr. Richards became engineer of maintenance of way; on June 1, 1903, chief engineer of maintenance of way, and on June 16, 1913, he was made consulting engineer, maintenance of way. During his continued service as the head of this department of the railroad he has largely influenced the standards established for tracks, stations, bridges and operating yards.

In addition to his duties as head of the maintenance of way department of the Pennsylvania Railroad system east of Pittsburgh and Erie, Mr. Richards, by appointment of the president, was made chairman of several committees for working out the plans for the New York and Washington stations and yards. In this capacity he has given much attention to the study and development of railroad stations, yards and terminals, and has largely influenced the working plans as adopted for the New York, Long Island and Washington terminals.



JOSEPH T. RICHARDS.

Luther Reese Zollinger.

LUTHER REESE ZOLLINGER, recently appointed engineer, maintenance of way, of the Pennsylvania Railroad, was assistant to division engineer, Philadelphia Division (West Philadelphia); November 1, 1895, to October 20, 1898, assistant supervisor, Division No. 8, Middle Division, P. R. R., at Spruce Creek; October 20, 1898, to January 1, 1900, supervisor, Division No. 28, Schuylkill Division, at Norristown; January 1, 1900, to May 1, 1902, supervisor, Division No. 1, Philadelphia Division, at West Philadelphia; May 1, 1902, to November 1, 1903, assistant to Principal Assistant Engineer, Pennsylvania Railroad Division, at Altoona; November 1, direct control of the maintenance of way department, in so far as may be necessary to insure the efficiency of the department and adherence to the standards of the company. He also has charge of the pre-

L. R. ZOLLINGER.

paration of all maintenance of way plans, the issuing of instructions in regard to the adherence to the same, and personally examines all bridges and other structures, reporting on their condition and making recommendations in connection therewith, and also with respect to other matters relating to the maintenance of way.

In addition to these duties Mr. Zollinger, in 1905-1907, was placed in charge of the construction of extensive yards and yard facilities at Morrisville on the New York Division and Shire Oaks on the Monongahela Division.

Mr. Zollinger is a member of the American Society of Civil Engineers.

George C. Koons.

GEORGE C. KOONS, recently appointed assistant engineer, maintenance of way, in charge of bridges and structures of the Pennsylvania Railroad, was born in Middletown, Pa., June 24, 1872. He received his education in the Reading, Pa., High School, from which he graduated in 1889.

Mr. Koons entered the service of the company in May, 1896, as a draughtsman on the Schuylkill

GEORGE C. KOONS.

Division. He went to Altoona in 1899, as a transitman, and on January 1, 1900, was appointed assistant supervisor in the Altoona yard. He was made assistant supervisor on the Middle Division on August 1, 1900, and in April, 1901, he was transferred to the Pittsburgh Division in the same capacity.

In May, 1901, Mr. Koons was made assistant supervisor of signals on the Philadelphia Division, and on January 1, 1902, he went to the Pittsburgh Division as assistant supervisor of signals. On February 1, 1901, he was appointed supervisor of the Monongahela Division. Subsequently he served as supervisor in Altoona, and on the Middle and Pittsburgh Divisions.

On June 16, 1913, Mr. Koons was appointed assistant engineer, maintenance of way, in charge of bridges and structures.

ARTHUR B. CLARK.

Digitized by Google

Arthur B. Clark.

ARTHUR B. CLARK, recently appointed assistant engineer, maintenance of way, in charge of roadway and track of the Pennsylvania Railroad, was born at Green Village, Pa., October 1, 1867. He attended the local public schools, and afterward Mercersburg College, where he took a three years' preparatory course and then entered Lafayette College, from which he was graduated in 1891, receiving the degree of civil engineer.

During his summer vacations in 1889 and 1890 Mr. Clark was employed on the Pennsylvania Railroad as rodman, first entering the service July 1, 1889. After graduating he was employed from September 14, 1891, as rodman on the Philadelphia Division, at Philadelphia. On July 2, 1896, he was promoted to assistant supervisor, and served in that position on the Altoona and Pittsburgh Divisions. On July 1, 1900, he was promoted to the position of supervisor on the Baltimore Division, Northern Central Railway. On July 20, 1901, he was transferred to the Pittsburgh Division and located at Pittsburgh, in charge of the track work of the Pittsburgh yard, in connection with the construction of the New Union Station.

On December 15, 1905, Mr. Clark was promoted to assistant engineer of the Middle and Western Division, Philadelphia and Erie Railroad. He was subsequently transferred to the same position on the West Jersey and Seashore Railroad, thence to the Maryland Division of the Philadelphia, Baltimore and Washington Railroad, as assistant engineer. On January 15, 1910, he was promoted to the position of principal assistant engineer of the Philadelphia, Baltimore and Washington Railroad, and on June 16, 1913, he was made assistant engineer mainteance of way, in charge of roadway and track.

Noel W. Smith.

NOEL W. SMITH, who was recently appointed superintendent of the middle division of the Main Line of the Pennsylvania Railroad with headquarters at Altoona, Pa., was born at Williamsport, Pa., December 25, 1869. He attended the public schools of Williamsport.

Mr. Smith's first service for the Pennsylvania Railroad was performed as a student in telegraphy in the ticket office at Williamsport. He was employed as clerk in the Division Freight Agent's office at Williamsport, July 1st, 1887, where he worked until September 12, 1889, when he entered Lehigh University.

After graduating from Lehigh University, Mr. Smith re-entered the service of the Pennsylvania Railroad as rodman on the Sunbury Division, April 24, 1893. He served as assistant supervisor on the Baltimore Division, Northern Central Railway; Renovo Division and Williamsport Division of the Erie Division; Maryland Division, Philadelphia, Baltimore and Washington Railroad, and on experimental track work for the Chief Engineer of Maintenance of Way, at Harrisburg. On January 1, 1900, he was promoted as supervisor at Williamsport, and later was made supervisor at Middletown and Harrisburg, on the Philadelphia Division. On December 15, 1905, he was transferred to supervisor in the office of the Principal Assistant Engineer at Altoona, and on May 1, 1906, was promoted to assistant to the Principal Assistant Engineer, at Altoona.

On April 1, 1907, Mr. Smith was advanced to division engineer of the Middle Division. He was made superintendent of the Central Division, Philadelphia, Baltimore and Washington Railroad on January 15, 1910, and on June 16, 1913, he was promoted to superintendent of the Middle Division of the Main Line at Altoona, Pa.

Samuel Porcher.

SAMUEL PORCHER, who has been appointed purchasing agent of the Pennsylvania Railroad with headquarters at Philadelphia, was born in South Carolina. on December 21st, 1857, and was graduated from the University of Virginia in 1881.

Mr. Porcher entered the machine shops of the Pennsylvania Railroad Company as an apprentice

N. W. SMITH.

SAMUEL PORCHER.

Digitized by Google

on January 27th, 1882. He went through a full shop course, including the test department, and was transferred in 1888 from the mechanical engineer's office to the office of the superintendent of motive power in Jersey City. In July of that year he was appointed assistant engineer, motive power department, United Railroads of New Jersey Division, in which position he remained until March 1st, 1894, when he was appointed assistant purchasing agent of the Pennsylvania Railroad Company. This position he held until his recent appointment.

E. W. Beatty.

E. W. BEATTY, who was recently appointed general counsel of the Canadian Pacific Railway with headquarters at Montreal, was born in 1877, at Thorold, Ont. He graduated from Toronto University in 1898, and from law at Osgoode Hill, and in 1901 was admitted to the bar. On the appointment of A. R. Creelman, K. C., as chief solicitor of the Canadian Pacific Railway in 1901, Mr. Beatty accompanied him to Montreal as assistant in the law department. Four years later he was appointed assistant solicitor and in 1910 was made general solicitor, which position he held until his recent promotion.

E. W. BEATTY.

Charles B. Foster.

CHARLES B. FOSTER has been appointed assistant traffic manager of the Canadian Pacific Railway with headquarters at Montreal. Mr. Foster was born at Kingston, N. B., in 1871. He was educated in the public schools and entered the service of the Canadian Pacific at St. John, N. B., as stenographer in the passenger department, April 1, 1891. In September, 1893, he was made traveling passenger agent and six years later became chief clerk in the passenger department. Mr. Foster was appointed district passenger agent at St. John in February, 1902, and in November, 1904, was transferred to the same office at Toronto, Ont. Four years later he was appointed assistant general passenger agent,

CHARLES B. FOSTER.

with headquarters at Vancouver, B. C. After holding this office over two years, he was promoted to general passenger agent at Winnipeg, Man.. November 1, 1910. He served in that capacity until his recent appointment, July 1, 1913, as assistant passenger traffic manager of the Canadian Pacific Railway, eastern lines, with headquarters at Montreal, Quebec.

A. M. Reinhardt.

A. M. REINHARDT, who has become assistant general freight agent of the Atchison, Topeka and Santa Fe Railway, with headquarters at Los Angeles, Cal., was born in 1878, at Lawrence, Kansas. He received a common and high school education and entered the service of the Santa Fe in 1895, at San Jacinto, Cal. He was promoted to relief agent for the same road in

A. M. REINHARDT.

Digitized by Google

1897, and was made cashier at Barstow, in 1899. From that year until 1903, he was successively agent at Temecula. agent at Perris, bill clerk at San Diego, and agent at Hanford. In 1903 he was made over-charge investigator and rate clerk in the claim department of the auditor's office, and in 1906, rate clerk in the general freight office. In the latter part of that year he became chief clerk in the general agent's office at Los Angeles and in 1908, chief clerk in the general freight agent's office at the same point. This position he held until his recent appointment as assistant general freight agent.

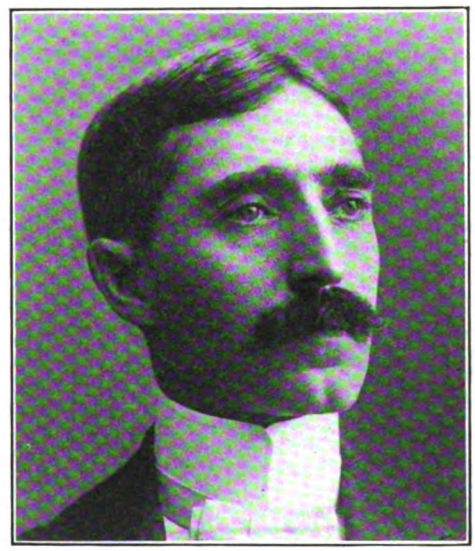
L. E. Abbott.

L. E. ABBOTT, recently appointed safety commissioner of the Oregon Short Line Railroad, was born in 1868, at Farmington, Utah. He received a common school education and later attended the University of Utah. He entered railway service as special officer for the Southern Pacific Company, during the work of building the Lucin cut-off across the Great Salt Lake. He retained this position until 1905, and later was engaged in special investigation work by the same road. He was appointed to his present position on June 1st.

James H. Hill.

JAMES H. HILL, who was recently elected vice-president, general manager and treasurer of the Galveston, Houston and Henderson Railway, entered railway service in 1878 as operator and later train despatcher for the Atchison and Nebraska Railroad. In 1880 he became chief operator of the Burlington and Missouri River Railroad of Nebraska, and in 1881, chief operator of the Kansas City, Ft. Scott and Gulf. In 1882, he was appointed superintendent of telegraph and chief clerk to the general superintendent of the Southern Kansas Railway, which position he held until 1888, when he became secretary to the Receivers of the Missouri, Kansas and Texas Railway and later secretary to the President and General manager of the same road. In 1896 he was made manager of the Galveston, Houston and Henderson Railroad, and later also assumed the positions of secretary and treasurer. In his new position as vice-president he still retains the title of general manager and treasurer, but drops that of secretary.

L. E. ABBOTT.



J. H. HILL.

Financial

The Currency Bill.

ASIDE from the current financial situation, the subject of greatest interest to business men at the present time, is the currency bill. Objections to this measure are multiplying, and it is worthy of note that representatives of the majority party are by no means unanimous as to the merits of the Owen-Glass bill, and also as to the expediency of presenting any bill at this time. The chief objection to the measure relates to the method of control.

The bill, as at present constituted, provides for complete Government control of the Federal Banking Board and does not allow the bankers any representation. Banking interests, almost unanimously, are opposed to this plan. No matter how conscientious and able the members of the Government Board might be, before they become really efficient a long process of education would be required, and in this process many mistakes would be made and mistakes effecting the banking and currency system of the entire country could inflict incalculable damage. The railroads have had abundant experience with control by commission and it is only in recent years that the Interstate Commerce Commission, a permanent board compared with the proposed banking board, has shown itself able to comprehend the problems with which

Digitized by Google

they have to deal. When the Interstate Commerce Commission was first appointed, and for many years thereafter, it was practically devoid of power. Its mistakes were many and serious but they did not affect the railroads since the courts intervened.

To subject the banking interests of the country to such centralized control without allowing the Board to go through the necessary process of preliminary education would be a serious blunder. It is also urged that the notes provided for by the new bill should not be issued by the Government but by the regional reserve banks and the tendency to inflation through the re-discount provisions is pointed out.

Improvement in Stock Market.

THE stock market has shown persistent improvement during the past month. It has disregarded the renewal of hostilities in the Balkans, the well authenticated reports of crop damage and a variety of other factors which, were underlying conditions less fundamentally sound, would have seriously depressed quotations. The fact is that securities have fallen so far that at present prices the best stocks present most attractive bargains to investors. The money situation, while on its face discouraging, especially to new enterprises, contains elements of great interest. For the first time in our financial history the banks have made an effort to enforce conservatism upon borrowers in order to prepare for the financial stringency next fall. This has resulted in the curtailment of borrowing and in larger bank reserves. There is no reason to anticipate any trouble this fall and with the crop moving period past, large amounts of loan funds will be made available for new enterprises.

The Bond Market.

THE bond market is in a remarkable condition with prices apparently at the bottom. Investors can now obtain as high yield for their money on purchasing the best bonds as they would have been able to secure at any previous time in the last fifteen years. Even during the 1907 panic New York City bonds did not sell on a 4½ per cent basis. Out of a dozen of the active high grade railroad bonds dealt in on the New York Stock Exchange during July, five fell below the lowest prices of 1907. This decline in high grade bonds has been in progress ever since February. There is no question of the security involved in the bonds whose quotations have fallen so seriously. The security is perfect. It is simply a question of the absence of demand. Both in the United States and Europe the investment demand has been at a low ebb for six months. There is plenty of money for investment but the political unrest and lack of confidence in the future of large enterprises, together with threatening labor situation, has induced conservatism. The investor has also been over stimulated by the multitude of new issues, many of these offering extraordinary returns.

The General Business Situation.

THE general business situation in the face of tight money and the depressed investment market is excellent. The United States Steel Corporation made an excellent report for the last quarter, earnings rising $2,000,000 above the highest expectations. The unfilled tonnage of the corporation on June 30, 1913, was about the same as a year ago.

Railway traffic has suffered no diminution. It is likely that the preliminary estimates of 3,000,000,000 bushels for the corn crop will not be realized owing to the drought. The wheat market is about the same as last year and the oats crops will be somewhat reduced. On the whole, the outlook is for an average of products whose sale will furnish wide employment in other industries and whose effects will extend far into the next year.

Another encouraging feature of the situation is the fact that manufacturers have generally adjusted their plants to the new tariff which it is certain will be passed substantially as originally introduced. In spite of predictions of disaster it is believed that the industries affected will quickly adjust themselves to the new conditions and that business will continue without interruption.

The new financing announced by railroads and industrial corporations in June represented the total of $147,101,000. This is less than half of the total of June, 1912, which was $299,323,700. Of the securities issues in June, the railroads announced $126,692,200 and the industrials $20,408,800.

New Haven's Bond Issue.

THE New York, New Haven and Hartford directors have decided to ask the stockholders to authorize an issue of $67,552,400 of long term six per cent bonds. This is a frank recognition of the fact that the rate of interest has gone up and that the strongest corporation must pay the price demanded by the investor for money. It also marks a radical departure from the practice which has been so largely in vogue in recent years of deferring the inevitable interest payments by issues of short term notes whose successive maturities present vexatious financial problems. The New Haven bonds will be twenty-year debentures, convertible into stock at par at any time after five years from date, and not later than fifteen years from date. These debentures will be offered to holders of the present outstanding convertible debentures at par. Out of the proceeds of these bonds the $40,000,000 of five per cent one-year notes issued in November, 1912, will be taken up.

Railroad Earnings.

RAILROAD earnings continue to make good showings in gross. The gross earnings of all the railroads of the United States for the year ending June 30, 1913, were approximately $3,175,000,000, an increase of $300,000,000, or 10.5 per cent over those of 1912. Net earnings, after the payment of taxes, show also a large increase, the first since 1910. Reduced to a mileage basis the gross earnings for the year ending June 30, 1913, increased $1,090 and net earnings $378. The net earnings per mile of road for 1913 while much higher than 1911 and 1912 are below the figures of 1910. Since 1907 net earnings per mile have increased only $45 or a little more than 1 per cent, while gross earnings have increased 12 per cent, This difference in the relative increase of gross and net earnings shows how little of the profits resulting from the larger volume of traffic the railroads have been able to save for their stockholders.

Digitized by Google

The Missouri Pacific's 1913 fiscal year showed $62,000,000 of gross earnings, nearly $10,000,000 above the figures of 1911 and $18,000,000 above the gross earnings of 1908. More than half the increase in gross earnings has been saved to net earnings. The new Missouri Pacific management under President B. F. Bush, on the basis of this year's business saved $4,340,000 in the transportation department as compared with the cost of moving traffic in 1911. The saving is 7 per cent of gross earnings and is equivalent to 5 per cent on $83,251,000 of Missouri Pacific stock outstanding. It is noteworthy in that it was made during a period when improvement work was in progress over the entire system and when economies on this account were difficult. The economies already made and which will be largely increased in the future, are showing about 17½ per cent return on the $25,000,000 spent on the property in the last two years. During the past year the Missouri Pacific has earned a surplus for its stock equal to a little more than 2½ per cent. In 1911 it showed a large deficit.

The Chicago and North Western closed its fiscal year on June 30, last, with earnings equal to about 10 per cent on its outstanding common stock as compared with 8.2 per cent in the previous year. For the fiscal year ending June 30, 1912, the North Western has only a small surplus over fixed charges and dividends. This year there will be a large amount to be put back into the property for improvements and betterments.

The preliminary report of the Southern Pacific indicates a surplus of 9.52 per cent on the stock. This compares with 7.9 per cent earned on the same amount of stock in the preceding year. The company reports gross earnings of $143,770,000 above the previous year's record. These large earnings have been made in spite of the damage to fruits from the frosts of last year, flood damage and reductions in revenue due to rate cutting.

The Seaboard Air Line Railway during May earned three times the interest on its income bonds. The company's full surplus for the fiscal year ending June 30, was $2,945,000, equivalent to 5 per cent on the $25,000,000 income bonds, and nearly 6.8 per cent on the $25,000,000 of preferred stock. It is believed that dividends on the preferred stock will soon be declared.

The Rock Island Railway Company earned a little more than 5 per cent on its stock during the last fiscal year. This is a slight reduction from the figures of the preceding year but in reality the earnings were much larger since the 1912 quotations were largely reduced. During the eleven months ending May 31, 1913, the Rock Island increased its maintenance expenses $2,570,000.

The gross earnings of the Wabash for the last fiscal year were $31,770,000, a gain of 12 per cent over last year, and a gain of 6.3 per cent over the best previous year in the history of the company. This remarkable advance in gross earnings was in spite of the fact that the improvement work representing an expenditure of more than $10,000,000 was in progress over the entire property. The past year for the Wabash has been one of high transportation cost because of these improvements. Owing to this fact net earnings have shown little increase but the net results will provide for all fixed charges on securities whose interest is now reckoned by the reserve, but will not be sufficient to cover interest on defaulted securities.

The Chesapeake and Ohio will earn 5.2 per cent on its stock for the last fiscal year which is little more than the amount of the dividend and has given rise to rumors of dividend reductions. For these earnings, moreover, extra dividends by the Hocking Valley and the Kanawha and Michigan are largely responsible.

The surplus of the Reading Companies can be estimated at about $15,500,000 or deducting sinking fund requirements $15,000,000 for the stock. Of this amount $12,000,000 is available for the $70,000,000 common stock, or 17½ per cent. The surplus for the present year is nearly twice that earned in the last fiscal year, owing to the fact that during the last year mining operations were suspended for a considerable time.

The earning statement for the Baltimore and Ohio for the year ending June 30, 1913, shows gross revenues of $101,556,132, an increase of $8,961,809. The net increase, however, was reduced to $100,000. The net revenues represent 7.13 per cent on the common stock as compared with 7.58 per cent of the preceding year. The showing would have been much more favorable had it not been for the disastrous floods in the West during March which caused a practical suspension of freight traffic for some time over a large part of the system as well as the loss of a large tonnage which would otherwise have been moved. The physical damage to the company's property is estimated at about $4,000,000. The Baltimore and Ohio is now one of the five great railway companies to show more than $100,000,000 of gross earnings. The others are the Pennsylvania, the New York Central, the Southern Pacific and the Atchison.

Legislation and the Efficiency of Railroads.

By WILLIAM MCCOMB.

IT has become a fixed idea in the minds of many of us that if we want anything ethical or material, all we need is an enactment of the legislature and the resultant law will give it to us.

We have clothed our law-making bodies with a kind of glorified omnipotence and in our thoughts vested their enactments with potential elements far beyond the justification of fact.

When we have a grievance against affairs politic or civic as they exist, we demand legislation to set them right. If, in the working out of basic economic laws, the results are not to our liking or profit, we rush to our universal cure-all, the law maker, as our grandmother did to her herb bag to cure our childhood ills, and with the same childlike trust accept the mixture, in the name of jurisprudence, with simple faith that it will purge our trade body of its troubles. So we go on putting statute law upon statute law for courts to interpret, until some modern philosopher might say, with apologies to Claxton, "of making statute books there is no end."

Through this method we have become a law-ridden, not a law-abiding nation. Indeed, many of our laws are passed to meet some supposed passing need, with as little concise study of their logical consequences as of thought to their enforcement.

Somebody will cry loud and strong for a law to regulate something or somebody, and the ever obliging legislature, with a weather eye to its political future, kindly passes the legislative sop, without thought either as to the practicability of

Digitized by Google

the law, the logical outcome or the general consequences of its enforcement.

Elysium is probably a place with a fine climate. Angels are undoubtedly highly desirable people. Utopia should be longed for and sought after. The millennium will be as welcome as the flowers in May. But none of these can be delivered to us through the medium of a literary effort, beginning "The people of the state hereby enact, etc.," and followed by the Governor's signature.

All of this is not new, rather does it seem to be an inborn characteristic of man. The early history of the race records many efforts of feudal kings to damn by bull and imperial decree, but they had more excuse for the foolishness of their attempts than we of the twentieth century. It has become so much a habit to attempt the impossible by legislation, that we take no heed of underlying principles, physical, commercial or economic, but rave on with our useless, needless and impracticable enactments.

Whenever we discover a wrong, either fancied or real, or find a condition we do not understand, without attempting to understand it, we begin to legislate to change it. One of the most fruitful fields of legislative enterprise in the past years has been the transportation interests of the country. Transportation is a highly technical business, none more so, the most rapidly developed end of our national advancement, with a growth so rapid, so stupendous that even those engaged in the work sometimes fail to sense its real bigness and complexity, much less those not directly connected with it.

Without being in, we have attempted to be of the transportation business, because of its very intimate connection with our personal lives. No one has attempted by legislative decree, to say how rapidly bridges were to be built, steel to be made, vehicles to be constructed. Nor have we attempted to lay down rules for conducting these enterprises, and if it had been attempted those who were engaged in the particular businesses affected by this legislation would have risen up in holy wrath at these attacks on private rights and private property.

While we use the products of these mills and factories, we do not attempt to tell the owners how to conduct their business, because the conduct of the business does not enter very intimately into our lives, but because of the very intimacy of transportation and our dependence upon it, we try to assume a sort of a quasi-proprietary relation to it. Without any attempt at technical knowledge or experience in transportation affairs, we have used our utmost endeavor to assist by legislation in the management of transportation, and have called upon the legislative bull to right our wrongs, either real or fancied, without undertaking first to find out whether we were attempting to upset some mechanical law or change some physical fact.

What is a Practical Railway Man?

NO public official within recent times, has made a sadder spectacle of himself in his effort to patronize the labor vote, than has Governor Sulzer, of New York. In fact, he has so far over-reached himself, that he has irretrievably lost the respect of many of those who had only the friendliest feelings towards him at the time of his inauguration. His latest act, which has caused a feeling of dismay in those quarters where the effect of the appointment is best appreciated, has been the appointment of a locomotive engineer to the Board of the Up-State Public Service Commission. The "Journal of Commerce" asserts that:

"The appointment by Governor Sulzer of a locomotive engineer to be a member of the Second District, or "up-State" Public Service Commission, is nothing short of disgraceful. The excuse given for it is even more so. Governor Sulzer is quoted in all the dispatches from Albany relating to the appointment, which is fortunately subject to confirmation by the Senate, as saying that his nomination of this man Chase is 'in accordance with the promise made by the Democratic Party in its platform adopted in the last State convention as follows: 'We favor the appointment of a practical railroad man as Public Service Commissioner.'" Governor Sulzer may know what was meant by 'practical railroad man' in that platform. If it meant that a locomotive engineer or fireman, or a conductor or trainman, or some other workman on a railroad, should be appointed to that important office, then the offense of 'fooling the people' lies with the framers of the platform and the party convention that adopted it.

"Mr. Chase may be a highly competent and faithful engineer. He may be a man of intelligence and high character. It is nothing against him if he is not qualified for so high a public office and one requiring analytical power and keen and independent judgment on complex questions. It is simply impossible that, with the kind of experience and training that he has had and the position he occupies, he should be so qualified. The appointment is ridiculous, and it cannot be otherwise than the cheapest kind of demogogism, bidding for the political support of organized labor. It is of a piece with the Governor's approval of the 'full crew' bill in pursuance of a pre-election promise.

"No person of sense can believe that this appointment is made because Mr. Chase is qualified, or is believed by the Governor to be qualified, for the duties of Public Service Commissioner. He can have no possible evidence of it or reason for believing it, and his motive is transparent. It is a bid for the labor vote, for the support of the labor unions, of which the Order of Locomotive Engineers is one of the strongest in the State and one made up as a rule of intelligent men. It is no compliment to the workingmen of the State to assume that their support is to be bought for a political party by such an offer of a share in the spoils as this implies. They may be presumed to have convictions and principles of their own as citizens, and an intelligent interest in public questions. They know as well as anybody that a locomotive engineer is not qualified to serve as a Public Service Commissioner, and, though they cannot be expected to object to such an appointment, they ought to scorn the motive of it."

The Burdensome Restrictions of State Legislation.

RAILROAD managers will undoubtedly welcome the day, if it ever come, when the regulation of their properties will be centralized in the National Government. A striking, although amusing example of the unnecessary trouble to which conflicting state regulations

Digitized by Google

often put the carriers, is referred to in a recent issue of the Boston "Evening Transcript," as follows:

"Railroad companies may frequently be pardoned for contending that their business is not all 'beer and skittles.' Recent legislation in Arkansas requires that passenger coaches running through that State shall, from May to November, be provided with window screens, and failure to thus equip them invites a penalty of from ten to twenty-five dollars a day. Some of the passengers object to them, but 'thus saith the law.' Oklahoma has also been busy, but her statute forbids the use of screens, so when a train approaches the dividing line it is pretty lively work to completely comply with the conflicting statutes. Screen laws have frequently been found embarrassing in more relations than one, but rarely have they been found so antagonistic as in this instance. As that involves interstate commerce cannot the United States settle it?"

Electrification of Canadian Northern Pacific Railway Feeders.

THE Canadian Northern Pacific Railway has announced that it will electrify its branch lines from Kamloops to Vernon, B. C., and it is unofficially reported that the railway company has acquired the charter and rights of the Couteau Power Company, which has been engaged in the preliminary development of a hydro-electric plant near Ducks, B. C. The lines from Kamloops to Vernon, and from Lumley to Kelowna, in British Columbia, will be 132 miles long and are under construction as a branch line to the Canadian Northern Pacific Railway. The Canadian Northern Railway is rapidly linking up a transcontinental line across Canada. At present its lines are operated separately—the Canadian Northern Quebec Railway in the Province of Quebec, the Canadian Northern Ontario Railway in Ontario, the Canadian Northern Railway and the Canadian Northern Alberta Railway in the prairie provinces, and the Canadian Northern Pacific Railway in British Columbia. During 1912 track was laid on the Canadian Northern Pacific Railway from Sumas to Hope, 41.64 miles, making the total track laid on the line 78.25 miles. The line from Hope to Yellowhead Pass, 421.82 miles, is under construction.

Proposed Kansas Livestock Regulations.—It is reported that the railroads of Kansas will ask the Legislature this winter to enact a law to discourage the slaughter of calves in this State. Thousands of farmers in Kansas sell their calves to the butchers as soon as they are big enough to kill. This has reduced the number of full-grown cattle on the market and in a few years will set Kansas back as a beef State. With the calves butchered, the State has little to look forward to in the cattle business. It is the plan of the railroads to prevent the wholesale marketing of calves and premature cattle generally for the meat food supply.

Railway Business for May.

DURING May the railways of the United States received for their services to the public an average of $8,230,000 a day; it cost to run their trains and for other expenses of operation $5,920,000 a day; their taxes were

$341,500 a day; their operating income $1,972,322 a day for the 220,897 miles of line reporting, or at the rate of $8.93 for each mile of line for each day. Thus for every six dollars of their earnings which remained available for rentals, interest on bonds, appropriations for betterments, improvements and new construction, and for dividends, the railways had to pay more than one dollar in taxes.

All of these amounts are substantially greater than the similar returns for May, 1912. They are from the summary of the earnings and expenses compiled by the Bureau of Railway Economics from the monthly reports of the steam railways of the United States to the Interstate Commerce Commission. They include over 95 per cent of the mileage and earnings of all the railways of the country.

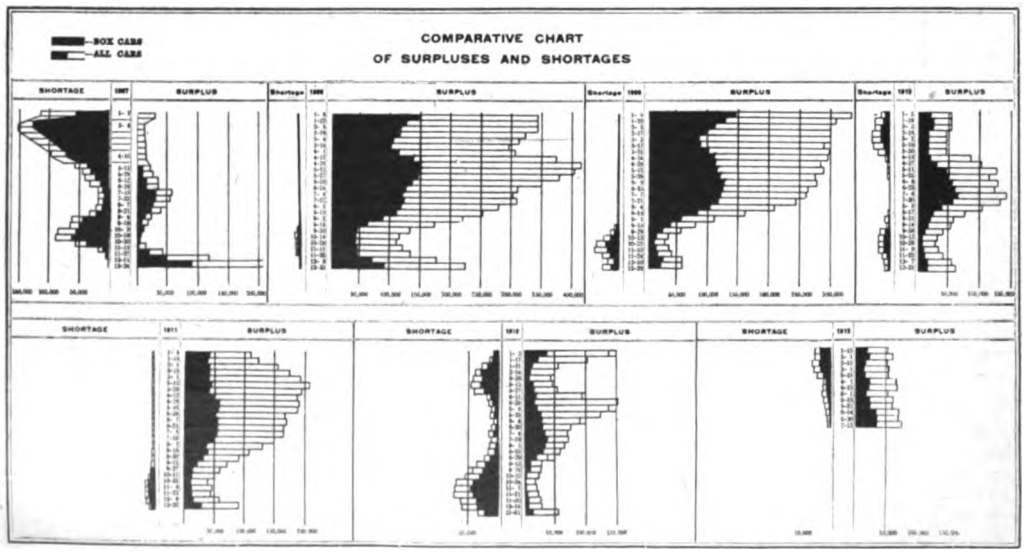
The Car Movement.

THE latest report of the American Railway Association regarding the car surpluses and shortages in the United States, shows that on July 15th, there was a surplus of 76,280 cars as compared with 70,740 on July 30th, and 75,389 on July 18, 1912. As compared with the preceding period, this shows an increase in the total surplus of 5,540 cars, of which 426 are box cars, 137 flat cars, 2,148 coal cars and 2,829 miscellaneous cars.

The increase in box car surplus is in Groups 1 (New England Lines), 2 (New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania), 3 (Ohio, Indiana, Michigan and Western Pennsylvania), 6 (Iowa, Illinois, Wisconsin and Minnesota), and 9 (Texas, Louisiana and New Mexico). The increase in flat car surplus is in all Groups, except 1 (as above), 8 (Kansas, Colorado, Oklahoma, Missouri and Arkansas), and 9 (as above). The increase in coal car surplus is in Groups 2, 3 (as above), 5 (Kentucky, Tennessee, Mississippi, Alabama, Georgia and Florida), 7 (Montana, Wyoming, Nebraska and the Dakotas), and 8 (as above). The increase in miscellaneous car surplus is in Groups 3 (as above), 4 (the Virginias and Carolinas), 6, 9 (as above), and 10 (Washington, Oregon, Idaho, California, Nevada and Arizona).

The shortage record shows 6,875 cars for July 15th, as compared with 7,036 for June 30th, and 6,467 for July 18, 1912.

Compared with the same date of 1912, there is an increase in the total surplus of 891 cars, made up as follows: 2,718 in box and 1,064 in flat, and a decrease of 2,217 in coal and 674 in miscellaneous car surplus. There is an increase in the



Digitized by Google

total shortage of 408 cars, made up as follows: 605 in box and 701 in miscellaneous, and a decrease of 710 in flat and 248 in coal car shortage.

The following chart graphically portrays the record of car surpluses and shortages during the past seven and one-half years.

Railway Mail Pay.

IN another section of this issue we present a full statement of the Committee on Railway Mail Pay, in which the railroads maintain that at the present time they are underpaid by at least $15,000,000 a year. Their complaint is not against the standard of measuring such mail service as is paid for, but that a large amount of service is rendered for which the Nation makes no allowance. This committee was appointed by the railways to present their plea for increased compensation to the Congressional Committee of Inquiry of which former Senator Jonathan E. Bourne, of Oregon, is chairman. Several hearings have been held by the committee. The Post Office Department was represented by Second Assistant Postmaster General Stewart, and the Interstate Commerce Commission by Prof. Max O. Lorenz, Associate Statistician.

The whole question of Railway Mail Pay will be found fully discussed in another section of this issue.

Results in Investigation of New Haven Wreck.

THE several investigations which, as we noted in our last issue, had been begun of the wreck which occurred on the New York, New Haven and Hartford at Stamford, Conn., on June 12th, have been completed and the results announced. Immediately following the wreck the New Haven officials appointed a committee of experts to investigate the accident, to make tests of the equipment, and to report as to the causes which led to the catastrophe.

On June 16 the committee inspected the locomotive and tender of the train and found, it reports, that the air brake piping was arranged "in accordance with modern practice," with the calculated braking power on the wheels slightly higher than recommended by the brake manufacturers. On June 17 the committee made various tests of the equipment while the locomotive was under steam and found it to be "in good average condition." To determine more definitely the performance of the brakes as a whole the train was then taken out for road service, the committee reporting as follows:

"The result of the running tests made by the committee showed conclusively that the brake on the locomotive was in first class condition.

"Based upon our experience in train brake operation and brake tests and the inspection and tests of the brake equipment on the locomotive and cars which made up the second section of train 53 on June 12, 1913, we are unanimous in the conclusion that the brakes on the locomotive and cars in question were in good, serviceable condition at the time of the accident and in every way capable of stopping the train short of the home signal at Stamford from a speed approximating those from which the stops were made with the train in the road tests on June 17, 1913." The railroad's statement adds:

"It will be recalled that on the six of the seven tests made on June 17 the speed varied from 55 to 64.5 miles per hour, according to the statement given out by the committee of experts after the tests."

After a sensational and protracted inquest, the Coroner of Bridgeport, Conn., exonerated the engineer, Doherty, who was driving the wrecked train. On the matter of the engineer's fitness the Coroner says that "Doherty's alleged incompetence is disproved by his almost perfect service record," and by testimony given by employes and officials of the company. In the matter of practical experience, the Coroner believes that the "one year rule" for engineers does not give sufficient experience, and thinks the limit should be increased to two years at least, "but preferably to three years."

While the distant and home signals, he finds, are too close together at Stamford and should, in the interests of safety, be increased to at least 2,500 feet, he does not think criminal negligence should be attributed to the company or its signal engineer in connection with their location, because of the fact that Stamford is a pre-determined stop and in view of Doherty's "knowledge and obligation to stop," and his "presumed knowledge of the place to start braking." The practice, however, the Coroner says, "of allowing one high-speed train to follow another into what is practically the same block and to come within a few feet of another on the same track is a foolhardy one," and a hazard "not to be justified by the slight gain in time over that lost by one train remaining in the block behind until the train ahead has cleared from its block."

This practice, the Coroner finds, also does "rude violence" to the public belief that, to insure safety, trains while running are kept one block apart.

The Coroner also holds that the company in view of agreement with the engineers' union "exercised all required care" in permitting Doherty to run the express.

In concluding, the Coroner says while there can be no question as to Doherty's competency, he is persuaded by the engineer's "presumed nervousness," due partly to his limited experience, and by other evidence, that he did not apply his "air" early enough, but too near the home signal. "It is within the range of possibility, I assume," he continues, "that something beyond human vision may have been wrong with the air activities of the engine, and that Doherty's story of its defects and of the places and points of failure is correct, and he thereby stands justified."

Of greatest importance of the several investigations, because of the effect which it exercises upon the public mind, is that conducted by the Interstate Commerce Commission, under the direction of Commissioner McChord. While naming Engineman Doherty, as responsible for the wreck in which six persons were killed and twenty-two injured, the report strongly condemns the New Haven System of management, by which a "green engineman" was given charge of a fast high class train.

The Commission goes further than mere condemnation of the New Haven's management. It serves significant notice that unless there is more economical and safe management there may be recommendations for Congressional action. The paragraph in which this threat was contained was

Digitized by Google

the concluding one in Commissioner McChord's report, and was as follows:

"Establishment of safer and more efficient operation of this railroad is immediately necessary if Congressional legislation extending the scope of the governmental regulation of railroads is not to be called for and justified in the interest of public safety."

After summing up exhaustively the evidence developed at the joint hearings with the Connecticut Public Service Commission, including the railroad officials' defense, Commissioner McChord says:

"No organization but that of the New York, New Haven and Hartford Railroad Company is responsible for placing a man in charge of this locomotive without tests or supervision by traveling engineers of his qualifications and judgment for this special work. The determination of the ability, fitness or qualifications of an engineman is the duty of the railroad itself. It was not delegated to any other organization, nor could it be so delegated.

"It was neither delegated nor performed. It was neglected. It was unwarrantably assumed that a man at the head of the list of spare enginemen was qualified. Something is 'out of gear' on a railroad where high class trains may be given over to an uninstructed engineman. And this is true even if he is sent out on a run with the caution of his superior, 'Don't let it get away from you.' Here was doubt from the man who ought to know.

"The responsibility for having a competent man with positive qualifications at a post of duty is a corporate responsibility. The fault for placing an untested man in a position fraught with danger to life is the fault of the company and its officials. 'Man failure' can only excuse the railroad and its officials where the man has been properly tested and found to possess the positive qualifications required.

"The absence of all competency tests of this engineman is a matter for which the management is solely responsible.

"His good judgment in bringing an express passenger train to a stop ought not to have been tried out at the risk of passengers' lives."

The general conclusions of Commissioner McChord include following important points:

"Establishment of safer and more efficient operation of this railroad is immediately necessary, if Congressional legislation extending the scope of governmental regulation of railroads is not to be called for and justified in the interests of public safety."

The report declares the whole evidence justifies the following conclusions:

"The engineman of second No. 53 (the wrecked train—Engineer Doherty) did not have the special experience and instruction required for the operation of such a train.

"The New York, New Haven and Hartford Railroad Company had no reliable method for determining the capacity of enginemen before placing them in charge of high speed passenger trains.

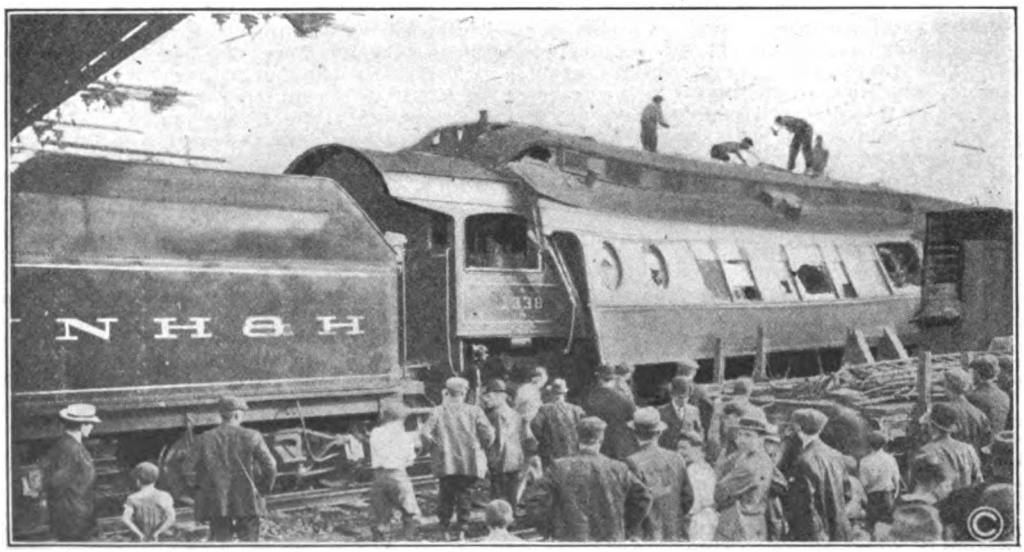
"There was negligence on the part of the corporation in putting in charge of such a train as second No. 53 an engineman inexperienced and uninstructed in this class of work.

"This railroad has no proper system of checking work reports, so as to determine whether or not defects reported on locomotives are actually repaired. This lack of supervision is dangerous and it ought not to be permitted to continue.

"The distance signal at Stamford is too near the home signal, and should be at least 2,500 feet distant therefrom.

"Modern steel equipment for high speed passenger trains should be installed at the earliest possible time, as recommended in previous reports of this Commission, and legislation fixing such a time should be enacted without delay."

Supplementing the findings of the Federal Commission, the Connecticut Public Utilities Commission submitted a report, the conclusions in which were strikingly similar. The Commission finds that from the testimony of experts and the results of the experimental tests with Doher-



GENERAL APPEARANCE OF THE WRECK ON THE NEW HAVEN AT STAMFORD, CONN., ON JULY 12TH.

Digitized by Google

ty's engine and train that the brakes were in good serviceable condition. It also finds that the distance and home signals are too near together at Stamford, and recommends that the distance between them be increased to at least 2,500 feet. It is now, 1,800.

Regarding engineers' qualifications it is recommended that it is neither "prudent nor safe" to allow an engineer of less than one year's road experience to run local passenger trains and that through express trains should be handled by engineers having at least two years' experience in road service. It is further recommended that frequent examinations of engineers be made to determine their fitness and knowledge of requirements. Referring to agreements between the engineers and the company the report says:

"The individual responsibility of a locomotive engineer especially on fast passenger trains is very great, and the primary and ultimate responsibility of the company for the safe operation of trains is necessarily great and imperative, and no arbitrary rule or agreement should be entered into which would lessen the degree of high efficiency necessary to meet these important responsibilities."

In reply to the conclusions of the Federal and State commissions, the New York, New Haven and Hartford Railroad Company issued a formal statement, the most important portions of which follow:

"The Interstate Commerce Commission's report on the Stamford accident, in which the New York, New Haven and Hartford Railroad Company is held negligent in putting in charge of such a train as second No. 53 an engineman inexperienced and uninstructed for that class of work, fails to state that the employment of this engineer was practically forced upon the New Haven Railroad by the engineers of the company.

"On May 14, 1910, an agreement between the engineers and the company was entered into providing that spare engineers shall be run first in and out so far as it is possible with the requirements of the service, and, when engineers are assigned to temporary vacancies, they shall remain on same provided they are competent until the regular engineer returns. They shall receive rates of the regular engineers while on the road.' This rule is practically the same as had been in effect before any agreement was entered into.

"In the fall of 1912 an order was issued to the effect that spare engineers who had less than two years' experience, or two years' rating as engineers, would not be allowed to run through passenger trains. This order was protested by the engineers on the ground that the company had not adhered to the rule of giving the engineers thirty days' notice before amending existing rules. The company then issued the thirty days' notice, and when this time was up, C. L. Bardo was general manager, having been appointed in the interim between the posting of the notice and its expiration.

"Mr. Doherty, the engineer on second 53 the day of the accident, had an excellent record. The company had no way of telling that he was incompetent; in fact, Mr. Bardo testified before the Interstate Commerce Commission that he still believes 'in all general matters as to his competency, that Doherty was a competent man.'

"The Interstate Commerce Commission reports the company negligent for employing Doherty on this run, but passes over the part played by the engineers in this matter."

The tangible results of the investigations and public agitation must after all be the positive steps which are taken by the company to prevent the recurrence of such a catastrophe, in so far as that is possible. The good faith and entire willingness of the company to meet every reasonable requirement is shown by the action of General Manager Bardo in promulgating the following order in respect to the assignment of engineers to passenger trains:

"Engineers must not be permitted to operate passenger trains except under the following conditions:

"First: They must have two years' previous road experience for through trains and one year's previous road experience for local trains.

"Second: They must have a certificate showing that they have passed all of the required examinations, a watch certificate, and a certificate of competency based upon the personal observation and knowledge of the road foreman of engines and master mechanic and approved by the division superintendent. A copy of this certificate must be given to the engineer and a copy filed in the division records.

"Third: No man shall be assigned to passenger trains wtihout the prescribed service qualifications or certificate of competency, unless he is accompanied by a road foreman of engines or other competent employe, who will remain with, and be responsible for him until his competency is established.

"Fourth: No man will be promoted to the position or employed as an engineer, or take rating as such, until he is furnished with the prescribed certificate of competency from the road foreman of engines and master mechanic and approved by the division superintendent; a copy of this certificate to be filed in the division records."

The Railways' Purchase of Cross Ties.

THE Census Bureau of the Department of Commerce, has just issued a bulletin in which it reports the number and kind of cross ties purchased by the railways of the United States during 1911. This number, including the purchases of both the steam and electric lines, amounting to 135,053,000 and represented a decrease of 13,178,000 as compared with the number purchased in 1910, but is over 11,000,000 in excess of the number reported for 1909. A significant feature of the 1911 purchases is that only 11,000,000 were for new track—the lowest percentage since 1908. The number purchased in 1910 for the same purpose, was approximately 22,000,000.

Ten kinds of wood supplied 95 per cent of all ties purchased. These are the oaks, the hard southern pines, Douglas fir, cedar, chestnut, cypress, tamarack, hemlock, western pine and red wood. The various kinds of oak are drawn upon, as a class, far more than any other kind of wood, 44 per cent of all ties purchased in 1911 being oak.

As to the woods which serve the various localities, Douglas fir, cedar, western pine and red wood meet the greater part of the demand in the far Western States; chestnut is used exclusively in the North Atlantic States, while oak, cedar, tamarack, hemlock, mixed hard woods and southern pine meet the requirements of the

Digitized by Google

Northern States east of the Missouri River. In this region the railroads have been forced to draw upon many species and a wide area to meet their increasing cross tie requirements. As for the Southern States, pine, cypress, oak and gum, fill the wants of the railroads of that locality.

The bulletin contains no report regarding the average cost of ties during 1911, other than stating that this cost has not varied greatly from that reported in 1909, which was 49 cents for all kinds of woods, ranging from 33 cents for hemlock to 53 cents for red wood, and for western pine. There have, of course, been marked fluctuations of these general prices in many of the producing localities.

In the division of purchases between the steam railroads and the electric lines, the former is credited with 126,155,000 ties and the latter with 8,898,000. This indicates the steam railroads purchased 93 per cent of the total number in 1911 which is somewhat smaller than the proportion reported in 1910. The trend of purchases from year to year, shows for the electric railroads a regular though slow increase reflecting the steady development of these lines, while the purchases by the steam railroads have fluctuated considerably according to industrial conditions.

The subject of tie preservation is dealt with in the bulletin, which states that of 112 treating plants of all classes in 1912, nearly 90 per cent were well equipped and operated in representative sections of the country from coast to coast although chiefly in the Eastern States. Many of these plants treat piling, poles, construction timbers, paving blocks, etc., besides cross ties, but aside from the general plants, the steam roads operated twenty-two plants to meet their own needs, chiefly in the treatment of cross ties. The growth of this industry is indicated by the statement that in 1911, 31,141,000 cross ties were treated, either before or after purchase, 30,544,000 in 1910; 22,033,000 in 1909; 23,776,000 in 1908, and 19,886,000 in 1907.

Over half of the preserved ties in 1911 were treated with creosote oil, while nearly 28 per cent received a solution of zinc chloride, and the remainder with a combination of these preservatives, crude oil, or various other materials. The report shows that southern pine, oak and gum are generally creosoted, although a large number of ties made from these woods are treated with zinc chloride. Nearly all of the Douglas fir ties were treated with zinc chloride.

Proposed Box Car Pool.

A POOLING system for railroad box cars, designed to protect the owners of the cars and prevent disastrous car shortages such as have recently been experienced, is proposed for immediate acceptance by the car service bureau of the American Railway Association, and will, in all probability, be adopted by the members of that organization.

The pool is to be organized by all the carriers and to be governed by regulations which will bring about the best and most prompt service possible to all the roads. The box car is the legal tender of railway equipment, and under the present system, as railroads frankly admit, the weaker roads graft on the stronger for cars. The per diem charge for car rental is a comparative pittance to the owning line in a brisk season, when these cars are worth not less than $5 a day.

Under the pooling system proposed by the car service commission, box cars will be owned in common by the carriers in addition, the arrangement will make for the standardization of equipment. It is understood the American Railway Association will ask the Master Car Builders' Association, which recently held its annual convention in Atlantic City, to furnish the necessary designs for uniform box cars and make such suggestions as may prove of value.

Government to Test Railroad Scales.

ANNOUNCEMENT is made that the Bureau of Standards of the Federal Government has contracted for a special car to be delivered in the near future which is to be used to test the accuracy of scales used by railroads. The car is to be fitted with a power crane and will carry a number of ten thousand-pound weights. By running the car alongside of a set of scales, any number of weights may be placed thereon or the car itself can be weighed empty and after the successive addition of each weight to its load. It will thus be possible to effect a varied test of each scale.

Maryland and Pennsylvania Experimenting with Automatic Train Stop.

IT has become known that the Maryland & Pennsylvania R. R. has for some time been experimenting with an automatic train stop device in its Baltimore yards and for two miles north over its line. According to the statement of G. E. Norris, the road's superintendent, the device has given such good service that the company plans to extend its use from Baltimore to Bel Air. Over those twenty-seven miles of the company's line, the train service is heaviest.

"The device," writes Superintendent Norris, "is designed to accomplish four objects, as follows:

"1.—To prevent two trains from entering the same block at the same time.

"2.—To prevent running through open switches.

"3.—To prevent accidents due to cars standing beyond clearance point on sidings, and

"4.—To prevent accidents due to broken rails."

The device is known as the Jones Safety Train Control System. For its operation, there is provided at such points on the line where signals are ordinarily needed, a strip of steel rail about fourteen feet long, called the "contact rail." It is set, for its brief length, quite as the third-rail of an electric power road is located at the side of the running rails. Connection with the locomotive is also established in much the same way as the current is carried from a third-rail to the motor of an electric engine, to wit, by an overhanging shoe. In the train control system, this shoe is carried on the forward truck of the locomotive's coal-tender. When not crossing a signal station, this shoe is free from all contact, but when the train reaches a signal, the shoe runs over the contact rail, and the signal circuit is completed.

The method of carrying the current to the engine cab is known as the intermittent circuit, the complete circuit being made through the regular running rails, but rendered effective only at the contact rails. Given any one of the four causes of danger, listed by Superintendent Norris, the current is carried to the contact rail,

Digitized by Google

passes through the shoe to the engine cab, and there takes effect in some one of two or three ways. First, if the train be only at the "distant signal," the speed control system merely lights a red electric lamp in the cab and shows a caution signal, warning the engineer of trouble in the second block ahead. But if the train be already at the "home signal" and is still exceeding a predetermined rate of speed, the control system sends a current from the contact rail into the engine cab which immediately operates a safety-valve, cuts off the engine's steam, and throws on the brakes. An automatic stop is effected.

According to the superintendent, "the device has given no maintenance trouble, and after eight months' operation on our road under regular operating conditions and on the most difficult part of our road, I am thoroughly satisfied that the cabin signal and train stop of our automatic train control system is not only practicable, but has proved its ability to prevent the loss of life and property."

Burlington Increases Transcontinental Pullman Service.

INCREASED Pacific Coast travel has brought about the inauguration by the Burlington of a new daily line of Pullman standard sleeping cars from Chicago to San Francisco, via Denver & Rio Grande and Western Pacific, commencing July 11th. The schedule provides a daylight service through the scenic portions of the Rockies and the Sierra Nevada mountains.

Railroads Experimenting with Lignite.

AN experimental station in charge of a department of the University of North Dakota at Grand Forks, has worked out a process which makes it possible for railway engines to burn lignite coal. This development means that western railroads will use western coal and this makes a market for the immense deposits of coal in North Dakota.

The Chicago and Northwestern and Burlington railways are now making practical tests upon forty locomotives in actual service, and if practice proves up with laboratory tests, then the railways will be able to make great saving in their fuel accounts.

Railroad coal in the western portions of these States and in western Nebraska, Wyoming, Colorado ranges from $5 to $6 a ton, while lignite can be bought, at this time, at $1.75 a ton.

The experiments are of great value not only to the railroads operating in the west, but also to the States of North and South Dakota.

Changes in Refrigerator Service on Rio Grande.

CARS of the American Refrigerator Transit Company will at once replace the cars of the Armour Refrigerator Company in the handling of produce and fruit on the Denver & Rio Grande railroad.

This move explains the addition by the American line of 2,500 refrigerator cars recently ordered from the American Car & Foundry Company. This new equipment gives the American Company 8,500 refrigerator cars. It is said that no friction exists between the American and the Armour companies, but that the latter terminated the contract with the Denver & Rio Grande in order to handle more easily the increasing fruit and produce business of Florida, Texas and Arkansas.

Boston and Maine Abandons Through New York Service.

A STATEMENT is issued by the Boston & Maine Railroad to the effect that it cannot start its through New York service as scheduled because it has not secured the Railroad Commission's approval of the lease of the Hampden Railroad. The statement says:

"The Boston & Maine Railroad has been obliged to give up the operation of the Hampden Railroad and the institution of through service between New York and Boston by that route, because of inability to secure approval of its lease of the Hampden Railroad by the Railroad Commissioners of Massachusetts.

"It is absolutely necessary that this lease should be approved before the Boston & Maine can legally operate the road, and this delay has rendered it practically impossible for the Boston & Maine to get the benefit of the through service it was expecting, for the present summer season."

Pennsylvania's Accident Record for 1912.

OUT of 61,443 men employed in train service on the Pennsylvania Railroad, 119 were killed in 1912. Of this number but seventeen were killed in accidents to trains, freight and passenger. The records show that but an infinitesimal proportion of accidents to employes occur on passenger trains.

There were some 68,000 men employed in shops and on the tracks in 1912. Of this number 166 were killed as a result of accidents, none of which was a train wreck.

While 285 train, track and shop employes of the Pennsylvania Railroad were killed in 1912, but seventeen, or about six per cent, of them were killed in accidents to trains. The other deaths were due to trespassing, to carelessness and, in some instances, to defects of shop machinery and other avoidable causes.

New Haven's Accident Record.

IN a statement in the Springfield Republican headed "There is no greater thing in travel than a high average of safety," the New Haven management calls attention to the fact that in the ten years from June 30, 1903, to June 15, 1913, under President Charles S. Mellen, the New Haven operated 5,078,750 trains. These trains covered 158,531,541 miles, practically 6,341 times the circuit of the globe. They carried 755,678,338 passengers paying fare.

In the ten years there were just six accidents to trains in which persons traveling in them were killed. The number of passengers who lost their lives as result of such accidents was just 29. In six of the ten years not a single passenger was killed in any accident, although 441,426,000 passengers were carried over a total mileage of 93,593,311. In the five accidents preceding 1913 no coroners' verdict or investigation by state or national authorities found any defect in the construction of road bed, condition of motive power

Digitized by Google

or equipment or in condition or operation of signals.

The territory covered by the New Haven is such that its passenger traffic is the densest of any large railroad in the country. The statement concludes: "It is because of this record for safety and because of the superior road bed and equipment that the public is shocked over every accident, of every character, from any cause, that takes place upon this road."

Change in Names of Pullman Cars.

USE of mythological and historical names in designating sleeping and private cars is being discontinued. Statistics compiled by the Pullman Company and made public show that names of cities, states and towns are being substituted, especially by western railroads. One Pacific Coast line already has discarded Indian names, pronounced with difficulty, for names of several cities in California and Colorado.

Lackawanna Displaces Ink with Indelible Pencil.

THE Lackawanna Railroad Company has issued a general order for all operators to discontinue the use of ink in making reports of messages, and to use the indelible pencil. The order went into effect on June 25th.

Several reasons are attributed for the change. The most important, according to the railroad officials, is that shipping ink is a nuisance. Bottles are broken in transit and often cause damage.

The indelible pencil will make a writing that can be observed as long as ink, if not longer, and will do away with the copying press, because hereafter the man who uses the pencil for the pen will simply slip a carbon sheet under that on which he is writing and at one writing will have a copy on file.

It is expected that the indelible lead pencil will be put in more general use in the future in departments where typewriters are not employed.

Northwestern Urges Greater Efficiency of Station Agents.

STATION agents of the Chicago & Northwestern have been officially urged to establish better records for efficiency. Their special attention has been called to "lost motion," impairing efforts for improvement in handling business.

Department of Commerce Orders Wreck Inquiry.

THE Department of Commerce, through the bureau of standards, has decided to make a Federal investigation into the causes of railroad accidents. Secretary Redfield, on July 1st, instructed the bureau to make a careful study of accidents resulting from broken car wheels and axles and render a report.

Certain data taken from the annual report of the Interstate Commerce Commission for the year ending June 30, 1912, giving the number of derailments due to defective equipment and roadways for the eleven years of 1902-1912, inclusive, brought about the order for an investigation. It appears that the wrecks caused by broken car wheels are substantially four times as many as those caused by broken rails, wrecks from broken axles are one-half greater in number than those from broken rails.

It would appear, therefore, that the total accidents arising from broken wheels and axles taken together are almost six times as numerous as those arising from broken rails, and that the tendency is toward a continuance of this condition, especially as regards wheels.

B. & O's. New Plan for Distributing Coal Cars.

BEGINNING August 1st new regulations for the distribution of coal cars will be enforced by the Baltimore and Ohio Railroad. During extended periods of full car supply mines will be furnished with a full quota of rolling stock, provided the cars are loaded and consigned promptly. Mine ratings will be based upon the month showing the highest average daily shipments of the total output of the operators during the preceding twelve months.

Rio Grande to Adopt Telephone Dispatching.

THE telephone probably will replace the telegraph for dispatching work on the Denver & Rio Grande system, according to an announcement made by Vice-President Brown, of that company.

Construction gangs will start this week installing a special and private telephone system between Grand Junction, Colo., and Ogden, Utah. For this purpose two heavy copper wires will be strung a distance of 328 miles, at an expense of upward of $50,000. It will require between 60 and 90 days to complete the work.

Not only will side tracks and blind sidings be equipped with telephone boxes, but all trains will carry instruments enabling trainmen to make connection at any point between telephone stations. Delays to trains occasioned by unlooked-for interruption of any character will be minimized and the despatching of trains expedited far beyond present possibilities. The heavily worked telegraph wires will also be relieved of much of their present burden.

Lehigh Valley's New Industrial Department Car.

THE Lehigh Valley Railroad has remodeled one of the company's largest dining cars and turned it over to its industrial department to be used as a traveling exhibition and meeting hall to promote and develop the road's industrial opportunities and agricultural territory. The car differs widely in its equipment and arrangement from the ordinary demonstration car such as is used in agricultural work. At times it will be divided into a kitchen, dining room and bedroom, and used to teach and illustrate domestic science. Experts from the New York State College of Agriculture, at Ithaca, have volunteered to carry on this work of teaching food values, proper methods of cooking, and sanitary care of the home with all the necessary apparatus and paraphernalia.

At other times the car will be provided with literature, maps, models, photographs, drawings, blueprints, stereopticons and moving pictures of factory sites and local industries along the lines; and with charts showing shipping points and fa-

Digitized by Google

cilities, statistics of production and returns, distribution of population, time element, and answering all the hundred and one other questions which a man seeking a factory is likely to propound.

A third phase of the usefulness of this versatile car will be the agricultural side, the giving of actual demonstrations and experiments in seed tests, the growing of feed, grasses and grains, and the development and use of fertilizers. Here again the show case, the photographs and stereopticon, and lectures of experts will all play their parts. The officials of the State College of Agriculture have consented to equip the car with seed and supplies such as they use in their demonstrations and to send experts along.

At other times the college will take over the car entirely in order to disseminate its own propaganda along the line. In other words, there will be no permanent exhibit, but the car will be busy the year around, sometimes in charge of the agriculturist of the Lehigh Valley and his three assistants in the field, at others turned over to teachers of domestic science, but always in charge of experts in their line.

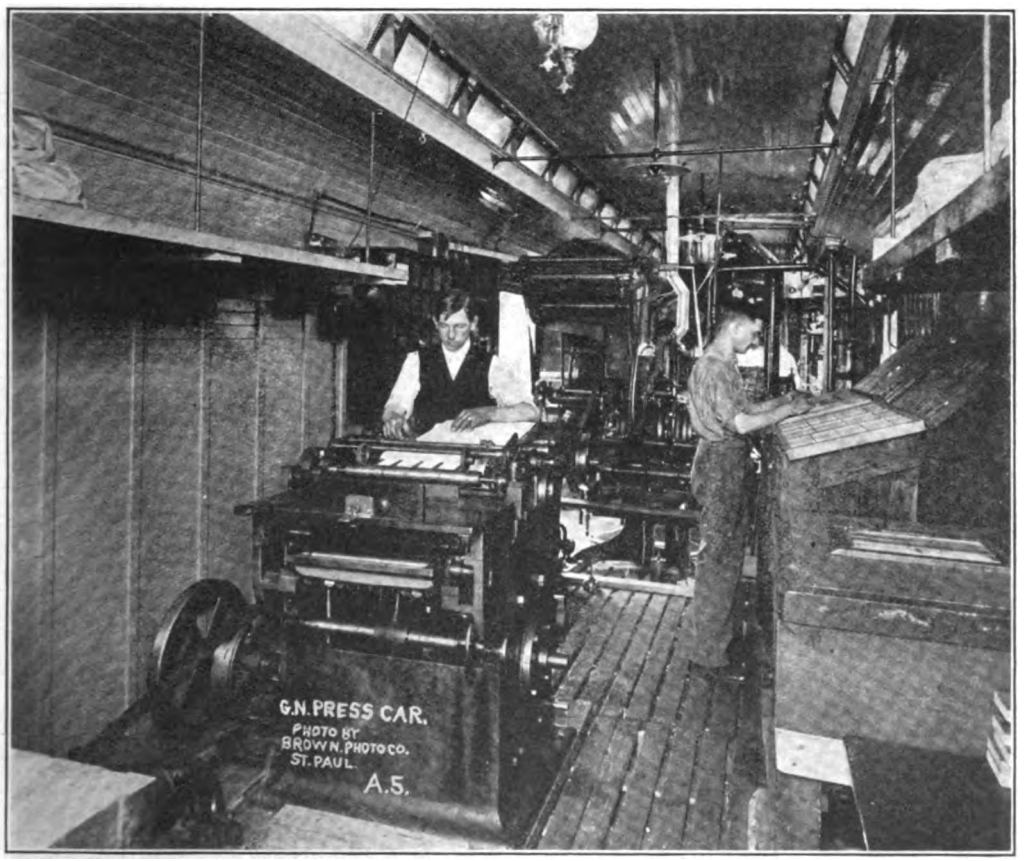
Mechanical

A NEWSPAPER PLANT ON WHEELS.

AN interesting and successful experiment was tried by the Great Northern Railway last month in connection with its hotel train which accompanied the members of the American Automobile Association in their annual Glidden tour from Minneapolis, Minn., to Glacier National Park.

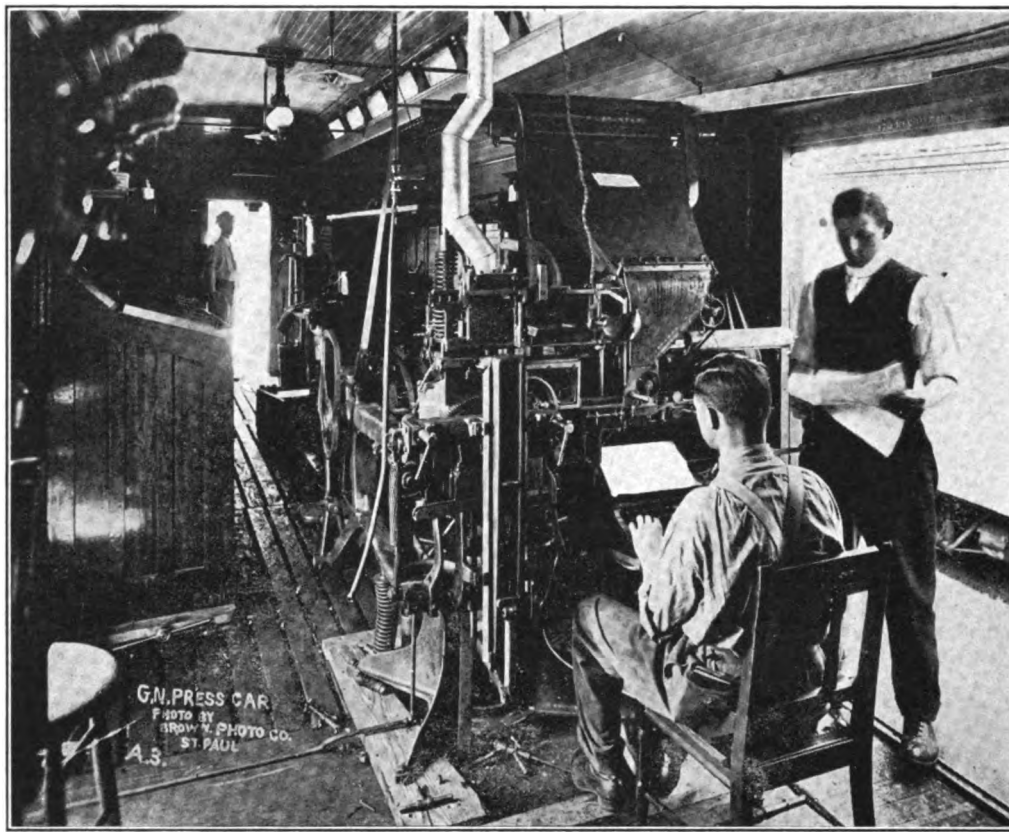
This enterprising railroad, not satisfied with furnishing a train equipment so complete that the tourist never felt the lack of first-class hotel accommodations, added another car with a small but strictly modern and efficient newspaper plant, with the result that during the nine-day trip the *Glacier Park Blazer*, a four-page daily, was successfully printed en route and was replete not only with interesting and current news items, but with numerous illustrations representing either incidents on the way or scenic marvels for which the route is widely celebrated.

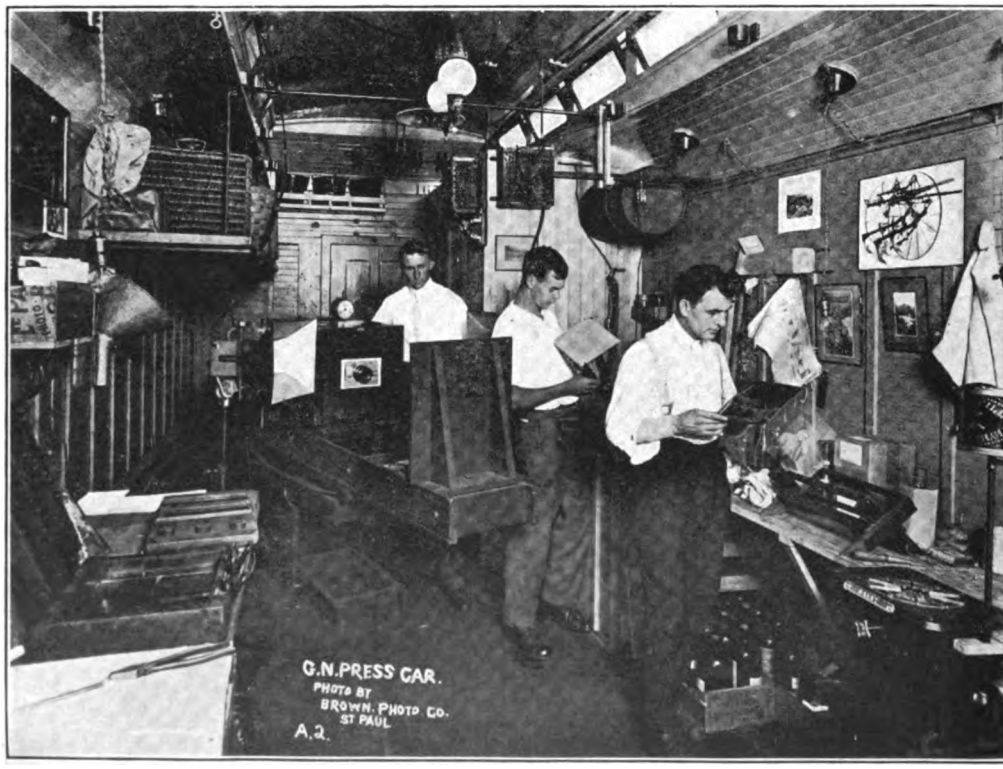
The plant, by means of which this newspaper was printed, was installed in a modern sixty-five foot dynamo baggage car and the equipment included a Linotype machine, a cylinder press and engraving outfit, making it possible to perform



This photograph and those on the following page show the interior of the newspaper plant carried in baggage car as part of the train equipment of the hotel train which recently accompanied the American Automobile Association in its regular annual Glidden Tour.

Digitized by Google





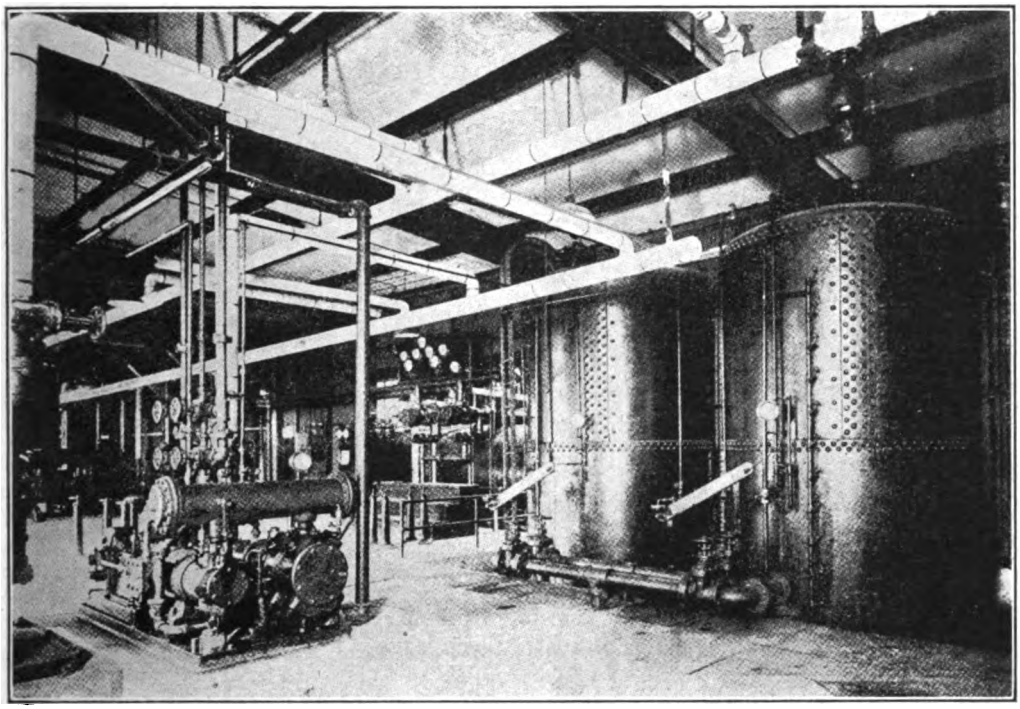
Digitized by Google

all the work necessary to publish a complete edition. The following illustrations give some idea of the completeness and working efficiency of the plant.

It need hardly be added that this innovation added greatly to the enjoyment of the tour and gave those who participated in it a delightful and intimate record, which will undoubtedly be carefully preserved.

BALTIMORE AND OHIO'S NEW TIE-TREATING PLANT.

THE Baltimore and Ohio has recently completed a new tie and timber preserving plant at Green Spring, W. Va. The general arrangement of the plant is shown in the accompanying illustration. The equipment throughout is the latest type, being designed to secure



INTERIOR OF NEW TIMBER TESTING PLANT OF THE BALTIMORE AND OHIO AT GREEN SPRINGS, W. VA., SHOWING COMBINATION MEASURING TANKS ON THE RIGHT AND RETORT IN THE BACKGROUND.

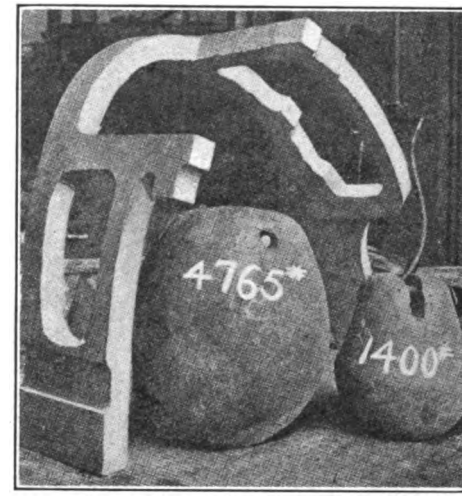
the maximum output with the minimum cost. On the right hand side of the illustration appears the combination pressure drain measuring tank, while on the left, in the foreground, is the Clayton air compressor. The air is pumped into the combination tanks after they have been filled with a preserving solution, until a pressure of 175 pounds is attained. The timber in the retorts absorbs the solution which is fed through a three-inch pipe running from the bottom of the tank.

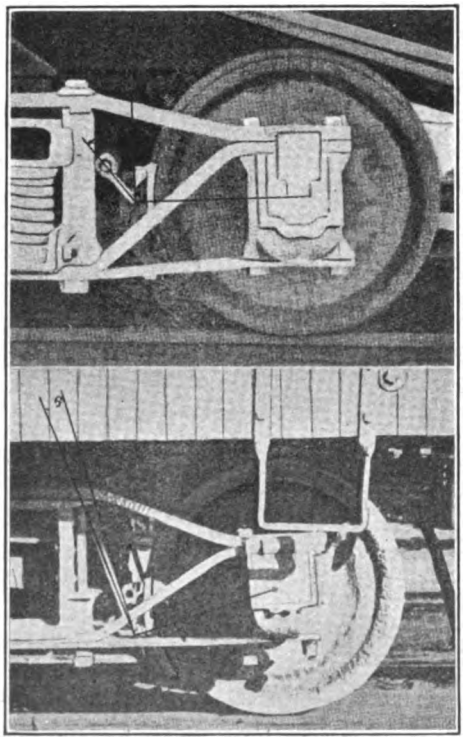
Interesting Test of Locomotive Frame.

THE Union Steel Casting Company has recently completed a most remarkable test of a vanadium steel rear frame for a Pacific type locomotive built for the Southern Railway. We reproduce herewith an illustration showing the locomotive frame bent cold into the form of a semicircle under the drop test without a sign of fracture. In all, 847,072 feet pounds of energy were required to bend the casting. Beneath the bent frame appears the two drop balls used, the one weighing 1,400 pounds and the other 4,765 pounds.



VANADIUM CAST STEEL LOCOMOTIVE FRAME AFTER DROP TEST.

THE CHILLED IRON CAR WHEEL.



VIEW 1.—IMPROPER BRAKE HANGER.

From a 90,000 pound capacity gondola car; weight, 33,700 pounds; length, 30 feet; length of hanger, 5½ inches.

VIEW 2.—PROPER BRAKE HANGER.

From a 60,000 pound capacity box car, weight, 33,700 pounds; length, 40 feet; length of hanger, 15 inches.

MR. A. A. HALE, of the Griffin Wheel Company, read an interesting paper on the chilled iron car wheel before a recent meeting of the New England Railroad Club. From the statistics available he calculated that the average mileage of such a wheel under freight equipment can be conservatively estimated at from 100,000 to 110,000 miles, and he calculated that, assuming that the average carload weighs thirty tons, the cost per thousand ton miles for the upkeep of wheels, amounts to slightly less than one cent. The wheel records of the leading railroads of the United States show that 97 per cent of all freight cars, including 100,000 pound capacity cars, are equipped with chilled iron wheels.

He concluded that, "It is safe to say, therefore, that there are over 20,000,000 chilled iron wheels in service in the United States to-day. If these 20,000,000 wheels were placed on a single track, one against another, they would extend a distance of over 10,000 miles, or more than sufficient to form a solid fence around the United States. If they were revolved one revolution, they would completely encircle the earth one and one third times. If they were piled one on top of another, they would make a column 2,500 miles high. Their first cost is approximately $162,500,000; the value of the old wheels as scrap is $97,500,000, or the net cost to the railroads amounts to approximately $65,000,000.

"There seems to be no limit to the reliable carrying capacity of chilled wheels. We have placed 33-inch 925-pound special chilled wheels under engine tenders of 9,500 gallons capacity, carrying a weight of 27,000 pounds, or a total loaded weight of 216,000 pounds. We have also furnished 33-inch 840-pound special wheels for 120,000-pound capacity ore cars operating in a very mountainous district, and these wheels have given

Digitized by Google

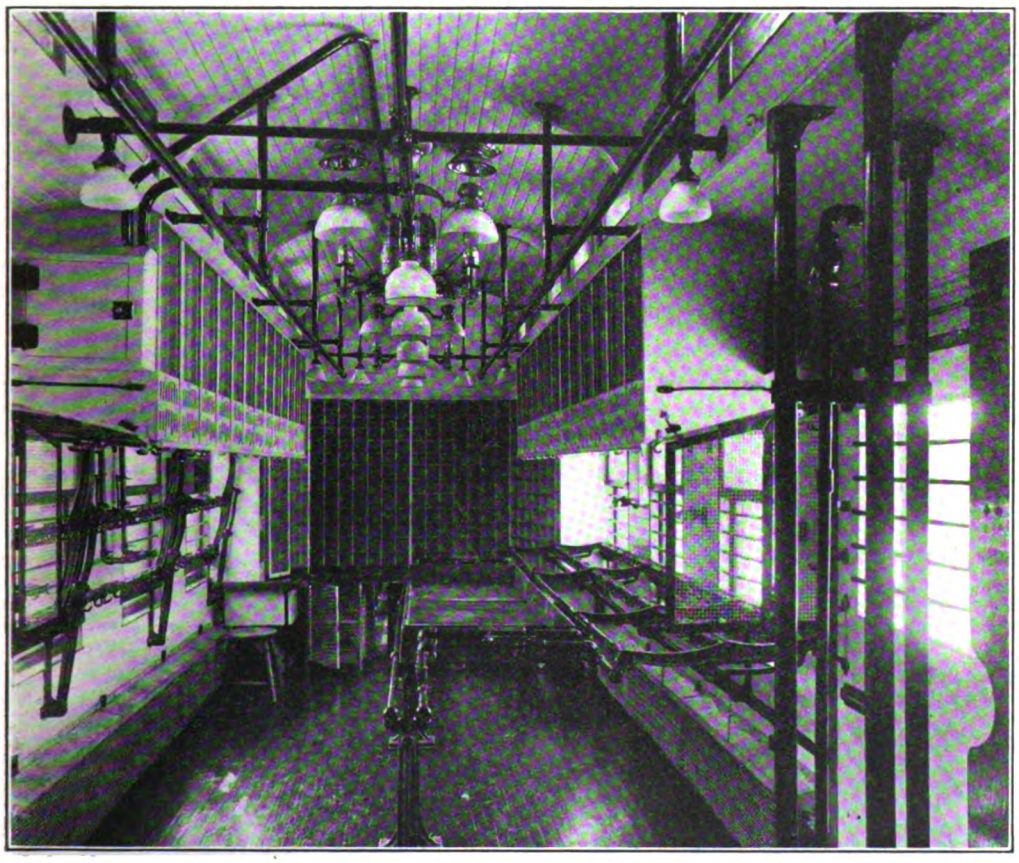
thorough satisfaction. As a matter of fact, chilled iron is the only metal of which wheels are manufactured which will stand up under extremely heavy loads without crushing or flowing. If the design and weights of wheels are left to the manufacturers, they are prepared to furnish wheels for 200,000-pound capacity cars; and, more than that, they will guarantee these wheels."

NOVEL MAIL POUCH RACKS ON THE ATCHISON.

THE accompanying illustration indicates the general appearance of the new mail pouch racks in service on the Atchison, Topeka and Santa Fe Railway. With these racks all the requirements of the Railway Mail Service Department are met and the maximum unobstructed space for storage of mail under the rack, when it is thrown up out of position, is obtained.

A car equipped with these pouch racks may be completely "dressed" before the trip, an essential operating feature as it is unnecessary to remove the mail bags in locking the rack out of position, as the bags hang clear of the floor at all times. The rack is of "unit" construction, having few operating parts and no complicated features.

It is light in weight and very strong, all the castings being of malleable iron. Greater height above the floor at the side wall of the car is provided for heating pipes than usual. The wall rack is rigidly supported and all lateral motion and the consequent wear of operating parts and noise, is prevented by the ingenious method employed of locking the rack section to the wall brackets with rack frame fulcrum eye belts. The rack may be locked down in position and two automatic catchers per rack section are provided for locking the rack up out of position.



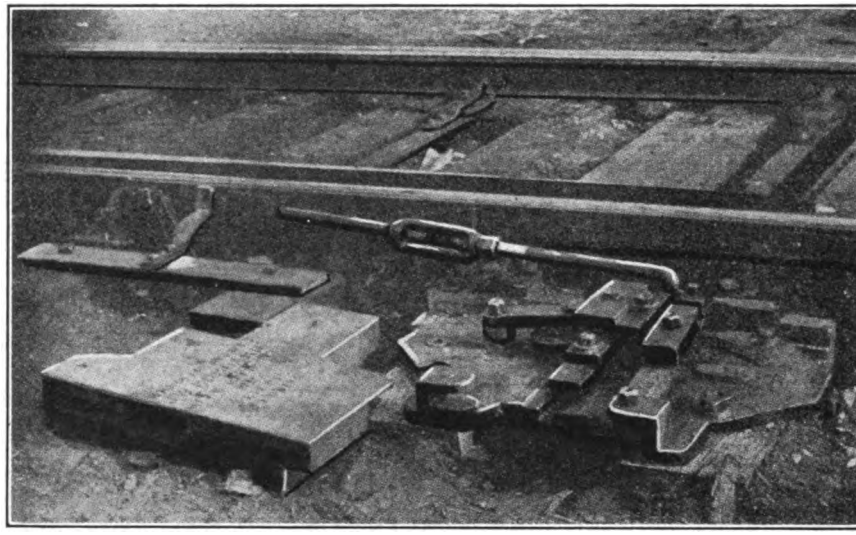
INTERIOR OF NEW POSTAL CAR OF THE ATCHISON, TOPEKA AND SANTA FE RAILWAY.

NEW AUTOMATIC SWITCH POINT CLOSER.

MUCH attention has been given by operating officials to the problem of securing a switch point closer or lock which will effectually close the point of rails of switches. The danger of "splitting the switch" by a train running against the point of a switch is widely recognized; it has been responsible for many of the serious accidents of recent years. Mr. J. W. Hubbard, of Eau Claire, Wis., has invented a de-

Digitized by Google

vice which it is claimed will accomplish the desired results. We reproduce herewith an illustration showing a close detailed view of the lock with the iron cover removed, to show the details of the lock as they are assembled on the base plate, which in turn is attached directly to the ties by bolts or spikes. The illustration shows the adjustable connection between the long locking bar and the lock proper, and it will be noticed in this connection that all of the parts of the lock are always in tension when in action. The locking bar is no longer than the maximum distance between car trucks, extending along the rail on the turnout side. It is the contact of the wheels with the locking bar that automatically closes and locks the switch, should it be found not fully set home at the approach of a train. The lock device proper is carried on a heavy steel plate attached to the main headlock and entirely encased with an iron cover.



VIEW OF LOCKING DEVICE OF HUBBARD SWITCH-POINT CLOSER.

THE EMPLOYMENT OF CAR TRUCKS IN BRIDGE REPLACEMENT.

THE accompanying illustration shows the method of using car trucks for bridge replacement north of Joliet, Ill. The RAILWAY WORLD is indebted to G. H. Jennings, assistant chief engineer of the Elgin, Joliet and Eastern Railway Company, for the data and photograph of the work.

It became necessary to renew a through plate girder bridge of the above railway over the tracks of the Chicago and Alton Railway. The old bridge consisted of three 33-feet spans, and was built about twenty-three years ago. The traffic could be interrupted but at short intervals and it was decided to erect the new bridge, consisting of two 30-foot spans and one 40-foot span, at the side of the old bridge, and to make the change by quickly shifting the old structure to one side and simultaneously moving the new girders into its place.

There were temporary tracks laid on the Chicago and Alton right of way, on which were placed twelve ordinary freight car trucks and on these trucks falsework was constructed, supporting the old as well as the new bridge. There were

REPLACEMENT OF JOLIET BRIDGE WITH THE ASSISTANCE OF CAR TRUCKS.

Digitized by Google

three pairs of girders in each bridge clamped together with rods and timbers so that the three spans of each bridge would act as a unit.

The new bridge weighs about 107 tons. As soon as the time came to make the change which was immediately after the passage of a train, the old girders were jacked up and the pedestals under the steel bents and the ends of the girders were removed.

The blocking was then placed under the old girders, on the falsework, and the jacks were taken out. A line was run from the false work under each end of the bridge, through snatch blocks, to the spools of derrick cars, placed on the Elgin, Joliet and Eastern track, one on either side of the bridge. Both bridges were moved at the same time, and but five minutes were required to take the old bridge out and put the new bridge in. The new bridge was then let down into place with jacks and the time required for connecting up the entire job was less than two hours.

CONSTRUCTION METHODS IN NEW YORK SUBWAY.

THE Public Service Commission of the First District of New York has issued an eighty-page booklet on "New Subways for New York—The Dual System of Rapid Transit," which describes in detail the ambitious proposal for the construction of an extensive system of subways for Greater New York recently adopted and for which contracts have been entered into with the Interborough Company and the Brooklyn Rapid Transit Company. We reproduce herewith illustrations showing the method of construction in the heart of New York's financial district, on the one hand, and in the outlying sections of Brooklyn, on the other. In the first instance, the street surface is covered throughout with a plank flooring, which is shored up and carried with false work as the excavation progresses underneath. The material is removed through hatchways, which are located wherever possible in parks or side streets, so as to avoid obstructing the thoroughfare. In this way street car and vehicle traffic will be kept moving as usual during the construction of the work, and storekeepers will not lose trade (a large number of storekeepers were bankrupted thereby during the con-

ELECTRIC TROLLEY CARRYING CONSTRUCTION MATERIAL ON BROADWAY, NEW YORK.

struction of the first subway) by reason of having access to their places of business obstructed. The type of electric motor and trailer used in hauling the material under city conditions is also shown in an accompanying cut. Only in the outlying districts where traffic conditions will permit will there be any open cut work allowed, and then only after the engineers of the Public Service Commission have satisfied themselves that such open cuts will not work unreasonable hardships to owners of property.

A Possible Safety Rail.

OUT of a cell in a North Dakota penitentiary, where a lifer has worked for years in the perfection of his invention has come what some railroad officials believe is a real safety rail. The first test by railroads of this safety rail is being made at Gary, Ind., the Soo Railroad having become interested in the invention.

The rail is divided into two parts, one serving as the tread to receive the wheel pressure, the other part being a re-enforcing bar which holds the tread in position and re-enforces it. It is necessary that the tread should be hard in order to withstand the wear of constant use. This necessitates the use of a high carbon steel, which crystallizes very easily in cold weather and also from other causes, and breakages are quite frequent.

The re-enforcing bar is placed back of the rail in such a manner as to sustain it and absorb a portion of the load and shock. This bar, not being exposed to the wear and direct shock and hammering of the wheels, does not have to be hard and can be made of low carbon steel of great tensile strength and toughness. The two parts are bolted together and spiked to the ties and if, from any cause, the tread portion should snap or break, it would still be held in place by the re-enforcing bar, which will not break, because it is made of low carbon steel and will not crystallize. By this combination of hard and soft material, it is claimed that perfect safety is attained, also greater strength and durability.

Canadian Official Invents Train Stop.

A. E. HUDSON, inspector of the Dominion Railway Commission, has invented an automatic train stop. It is a device placed beside the rail which comes into contact with an appliance on the side of the locomotive, automatically setting the brake and closing the engine throttle, preventing enginemen running past a signal set to danger, or into an open switch. Tests have been made which are declared to be satisfactory.

New Haven Installing Superheaters.

THE New Haven Railroad will equip all its 350 locomotives with the superheater device, overhauling them at the rate of five a month at a total cost of approximately $1,000,000. The fifty new "Pacific" type locomotives recently received by the New Haven are all superheaters. The work of overhauling will be done in shops at Readville, Mass.

The outlay of $1,000,000 required by this work is justified by the fact that the hauling capacity of the locomotives will be increased about twenty per cent while at the same time there will be affected a saving of twenty per cent in coal and twenty-five per cent in water.

Pennsylvania Installs Heat-Treating Plant.

THE Juniata shops of the Pennsylvania at Altoona, have been provided with a modern heat treating plant for the purpose of bettering steel used in the work of the company, and getting better results in the way of resistance to strain and wear.

Pennsylvania Introducing Mechanical Stokers.

ON the Pennsylvania Lines West, 140 locomotives are being equipped with mechanical understokers, a smoke reducing device, which will make a total of 294 provided with this means of meeting complaints about smoke.

Electrical

Electrical Transmission for the Panama Canal.

AS the Panama Canal nears completion, interest increases in the character of the electrical installation and the methods to be employed in distributing the energy for Canal requirements. It is not unlikely that these developments will contain helpful lessons for those who are giving their attention to the problems of steam railway electrification.

It is now reported that construction work has begun upon the permanent electrical transmission line across the Isthmus. A few foundations for the track-span bridges have been placed at New Culebra siding, on the Gold Hill relocation of the Panama Railroad, and first shipments of steel for the bridges have arrived from the

Digitized by Google

United States. A shed is being constructed in the abandoned borrow pit just east of Gatun Locks, for the assembling of the bridges.

The transmission line is fundamentally to transmit electrical energy from a source of generation at Gatun to load centers at Miraflores, Balboa, and Cristobal. The system is simple and straightforward. At the Gatun spillway, a portion of the lake water will be passed through turbines to generate electrical energy, as described in *The Canal Record* of July 3, 1912. The energy, generated at 2,200 volts, 25 cycles, three-phase, will be carried along the east wing of Gatun dam by heavy cables in duplicate underground duct-lines, and through tunnels under the locks, into a transformer substation, situated on the east side of the locks. The duct-lines are in duplicate, to insure maximum safeguard against damage in event of a burn-out of a cable in one or the other of the lines, and are to be laid approximately 600 feet apart.

At the Gatun substation, which is to be situated at the north end of the hill upon which the present Atlantic Division office building stands, the electrical energy will be transformed from 2,200 volts to 44,000 volts by means of step-up transformers. The equipment, in addition to three 2,000-kilowatt transformers, will consist of the necessary lighting arresters, oil switches, fuses, control board, and other auxiliary appurtenances. Two high-tension lines will emerge from the substation and tap into duplicate transmission lines.

The transmission line will run from Cristobal to Balboa, completely across the Isthmus, permitting distribution of energy both ways from Gatun. The line is to parallel the right-of-way of the Panama Railroad for its entire length. At Cristobal and Balboa will be terminal substations similar to the Gatun substation. The terminal substations will receive the energy at 44,000 volts, less the voltage drop in the line, and step-down transformers will convert the pressure to 2,200 volts, which will be the distributing voltage for all circuits. At Miraflores, a substation will be installed for supplying energy for the motors and lamps of Pedro Miguel and Miraflores Locks. If electricity is required along the line, the transmission lines will be tapped by outdoor type of transformer substation equipment. This will probably be done at Caimito, to supply electricity to the high power radio station; at Monte Lirio, to supply power to the bascule bridge, and at any permanent town or military reservation which demands electric lights and power.

At Miraflores, the present steam turbogenerators will be tied into the permanent electrical system through 2,200-volt tie-lines extending to the Miraflores substation. The steam station will serve as a reserve in the event the hydroelectric station at Gatun should break down. In emergency, energy from Miraflores will be transmitted back to Gatun and to the terminal substations at Cristobal and Balboa, insuring a continuity of service on her system at all times. The present steam station at Gatun, which has been operated during the construction period, may be abandoned in a year or two if conditions warrant placing entire dependence upon the water power. It will, however, be tied temporarily into the system, until abandonment, and will also be required to supply energy to Gatun Locks until such time as the transmission system is fully installed.

The type of transmission line which has been adopted is illustrated in the accompanying sketch. The track-span bridge supports one of the duplicate three-phase lines upon each side of the railroad tracks. Each of the three power conductors is carried from suspension insulators attached to a side bracket. The conductors are No. 00 in size, and are five feet apart and five feet from the frame. The insulators are made of vitreous porcelain, in three units, which is ample to sustain the impressed potential of 44,000 volts. The insulator fittings are made entirely of monel metal to resist climatic corrosion. A ground wire for protection against lightning is carried at the top of each side frame. The ground wire is 5-16-inch copper-clad solid wire. The copper-clad wire is furnished with a copper sheath of nearly one-half the area of the wire, surrounding an amalgamated, carefully selected steel core.

The steel bridges are spaced on 300 foot centers, a total of 917 being required across the Isth-

Digitized by Google

mus. The span between side frames is 36 feet. The track-span bridge, in addition to supporting the duplicate transmission lines, admits of the suspension of a catenary trolley construction, should it prove desirable in the future to electrify the Panama Railroad.

The construction adopted has several advantages for transmission purposes. By paralleling the Panama Railroad, material can be brought to within a very few feet of the point of actual erection. The side bracket suspension of the conductors separates the duplicate lines so that a burn-out in one will in no manner affect the other. The conductors are outside the track and will be comparatively free from deterioration caused by smoke from the locomotives. The structure itself is fundamentally strong and is capable of easily resisting all strains introduced by breaks in the wires.

A few details of construction are worthy of note. The No. 00 copper conductors are 7-strand pure copper cables, totaling 1,500,000 feet in length. The individual strands are manufactured without either a soldered or a welded joint. Splices in the cable will be made with soft copper sleeves. The conductors are suspended at the insulators from monel metal fittings, which are bushed with a copper sleeve. Thus, in the entire length of line, there will be no point where the copper strands are in intimate contact with a second metal; this prevents the introduction of an electric couple and consequent electrolytic deterioration.

At each track-span bridge, the ground wire will be clamped to the tower, and a positive T-connection through a copper wire will be made to ground plates buried in the earth. These ground plates are being manufactured from old scrap copper and cable which have accumulated at the Empire storehouse. By frequently grounding the wires, it is expected that line trouble and substation burn-outs caused by lightning will be reduced to a minimum. Five hundred thousand feet of copper-clad wire are required for the two ground wires.

The insulators, which will support the conductors, are of two types, suspension and strain, each assembled of three porcelain discs, ten inches in diameter, joined by monel metal fittings. This metal is used on account of its unusual strength and its ability to resist corrosion; galvanized fittings which are customarily used in the United States and abroad are considered practically worthless in the Isthmian humidity. The strain insulator is to be used on sharp curves and for anchoring at intervals, and the suspension insulator is to be used upon tangents and light curves. The suspension insulator swings freely from the bracket, while the strain insulators take the position of the conductors and hold the conductors more rigidly to a line. Each wire requires two strain insulators per bridge on sharp curves, and one suspension insulator is required for each wire per bridge on tangents and light curves. Four thousand suspension insulators and 2,500 strain insulators, have been ordered for the entire line. The total weight of the copper conductors, including the ground-wires, will be approximately 400 tons.

In the design of the bridge the steel is distributed, so as most efficiently to resist the maximum stresses incurred. The side frames are A-frames, to resist uprooting of the bridge in event all wires are down in one span. The crosspiece is made of two channels, which are crossbraced to carry the longitudinal pull of the catenary construction which may be attached if the railroad is electrified. The side brackets for supporting the line conductors are three-legged, designed both to support the weight and to resist the torsional pull of the wires. The brackets and the crosspiece are braced to the side frames, so that the entire bridge acts as a unit to resist side pull on sharp curves.

The type of concrete foundations for the track-span bridges has been given considerable study. The standard foundation will consist of two pedestals under the two legs of each side frame, the pedestals resting upon a spread slab, which latter is reinforced by scrap steel rails. Each leg of the side frame is to be secured to the pedestal through two 15-inch anchor bolts, which are clamped at the lower end to the steel rails in the spread slab. Provision for anchoring the foundations is made by extending downward long reinforced rods, encased by concrete in a drilled hole, which latter has been sprung at the bottom with light charges of dynamite. This foundation should afford a thorough footing, both for the normal bearing and for anchorage to resist side pull when wires are broken.

New Haven's Electrification Almost Completed.

PRESIDENT C. S. MELLEN will leave the New York, New Haven and Hartford system just a little too soon to witness the completion of one of the most important developments in the history of American transportation, the substitution of electrical power for steam on the line between New York and New Haven.

Another link in the electrification of this division is being pushed to completion as rapidly as possible, and while it cannot be definitely stated when trains will be operated by electricity all the way from New York City to New Haven, this time is not far distant. The link that will complete the electrification to New Haven is the one between that city and Stamford. Part of this is completed; and but a small portion remains to have the finishing touches put on.

While the electrification of the New Haven from New York City to Stamford was in many ways an experiment, the continuation of this work to New Haven has a particular significance, in that it is evidence that the first experiment has proved to be a success of sufficient degree to assure the management of the wisdom of electrifying the whole New Haven system as rapidly as the financial and physical aspects warrant. It is well known that it is the hope of the directors that the line from New York to Boston will before many years be entirely electrified.

The section from Stamford to New Haven is about forty miles in length. This entire section will obtain its power from the present power house at Cos Cob, which in itself illustrates the foresight of the New Haven management. This means that the Cos Cob power house will generate electricity to supply another section which is nearly twice as long as the one from Woodlawn to Stamford. It is estimated by engineers of the company that the Cos Cob power house will be capable of taking care of all normal traffic on the line as far as New Haven, but on days when special traffic is handled, steam will have to be

Digitized by Google

resorted to on some trains on the Stamford to New Haven link. When the electrification is continued to New London or Hartford another power house will be erected to relieve the Cos Cob house of some of its heavy burden.

New Canadian Pacific Project.

THE Canadian Pacific Railway will shortly begin the construction of an electric road from Hamilton to Niagara Falls. This road will enable the Canadian Pacific to handle traffic direct from Hamilton to Buffalo on its own right of way instead of operating over lines of the Toronto, Hamilton & Buffalo and the Michigan Central.

Problems of Electric Freight Yards.

ONE of the most difficult problems in connection with railway electrification is the electric operation of switching yards for freight service, comments "Engineering News." Where the third-rail system of operation is employed, it will be conceded, probably, that operation of a freight yard by electric power is out of the question. The work of yard men is dangerous enough at the present time; and if we were to add to present dangers the necessity of keeping clear of a labyrinth of highly charged third rails, extending all over the labyrinth of tracks, it may well be expected that the result in casualties would shortly result in a public outcry and consequent legislation compelling the abandonment of the system.

With the high-tension overhead system of electric distribution, however, such as is now in use on the New York, New Haven & Hartford Railroad from New York to New Haven, it becomes possible to equip a freight yard for electric operation by suspending a network of electric conductors overhead. This has now been done for the New Haven Railway at its Harlem River freight terminal in the northern part of New York City. This terminal covers an area of 200 or 300 acres, and its tracks have a total extent of 86 miles.

Agitation for Electrification in Buffalo.

THE agitation to compel the steam railroads entering Buffalo to electrify their lines has led to the request for an opinion from the corporation council as to the power of the city to compel such action. Section 17 of the charter, he declares, gives that right. This reads:

"The common council shall from time to time enact ordinances:

"7.—To prohibit or regulate the use of locomotive engines and of steam and to regulate other motive power and speed on any portion of any railroad within the city."

Care must be taken, he says, or the amended ordinance may permit the use of locomotives burning oil, as is done in some sections of this country. If that substance were used for fuel it is questionable if the smoke would be abated.

However, the common council does not have the specific power to require that electricity be used.

The way the corporation counsel would get around the difficulty is by enacting the following amendment, making it section 6-A of chapter 5 of the ordinances:

"On and after the first day of January, 1916, it shall be unlawful for any railroad company to operate trains by the use of locomotive engines, propelled by steam power within the limits of the city of Buffalo. Any corporation or company violating the provisions of this section shall be subject to a fine or penalty of not less than $100 nor more than $250 for each and every offense and the employe of such corporation or company in charge of a locomotive operated in violation of the provisions of this act shall be subject to a like fine or penalty."

Future of Electric Development.

ONE of the most important committee reports, read at the recent meeting of the National Electric Light Association, was that upon Public Policy. Upon this committee many of the ablest lighting men of the country served and the report gives evidence of having been carefully considered. Most significant is the picture drawn of the use of electricity in the future. The report says:

"You will see a vast distribution system stretching from one end of the country to the other wherever density of population justifies it. You will see electric energy used for all classes of power where power is required. You will see it produced from a common source. You will see a co-operation that will lead to so low a cost of energy as to place it within reach of all and to make it possible to develop almost any class of industry wherever transportation is provided and wherever it is possible to get the operatives necessary for the manufacture."

Unfortunately the report devoted more serious consideration and more space to the general policy of manufacture and the welfare of operatives than it did to building up closer affiliations with the consuming public. It was advocated, of course, that the electrical industry of any community be concentrated, regulated and saved from competition, but there was little definite suggestion as to how to bring about the rosy prospects quoted above, or to reduce the cost of energy to a point where everyone could use it.

It must be understood that this association is made up of those who manufacture, and distribute for sale, electrical energy. The interest of these people is to make money, but the association should not lose sight of the fact that one of the best ways to make money is to take good care of the customer. It is to protect these consumers that the law has set up regulating commissions; but, it is also up to the electrical people themselves to accord fair play and to accept moderate profits.

Developments Concerning Pennsylvania's Electrification.

ASSURANCES have been made that the work of electrifying the main line of the Pennsylvania Railroad from Broad Street Station to Paoli would be completed and ready for operation by the fall of 1914, as stated some months ago.

The engineering feature of this work is tedious as many details have to be considered, but it is expected that by fall the surveys will have been completed and plans prepared to permit the letting of contracts.

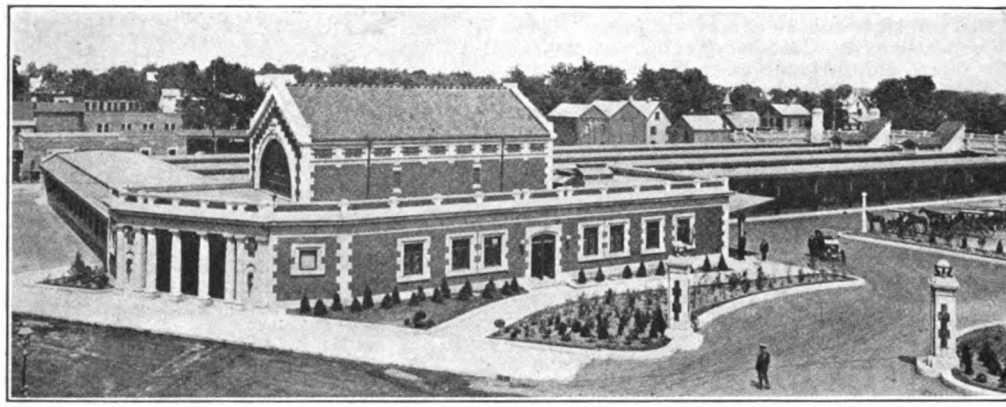
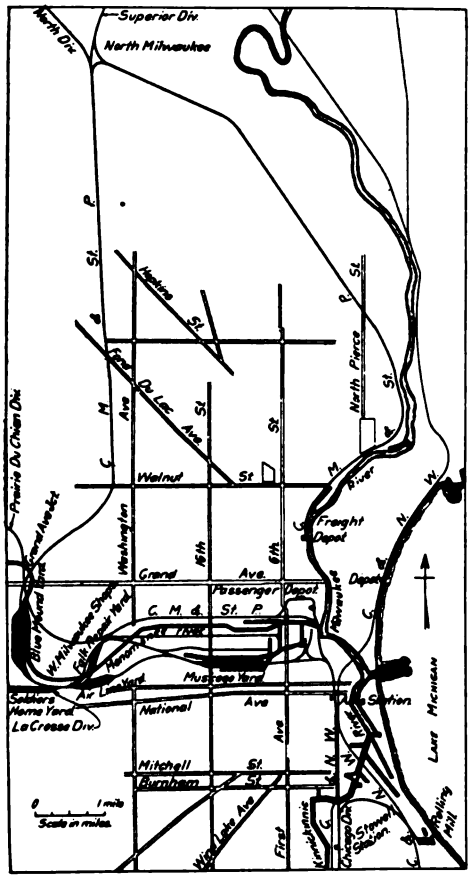
Terminal Improvements

Attractive Type of Suburban Station.

THE Lackawanna has recently completed and put into service a most attractive and well arranged suburban station at Montclair, N. J. The general appearance of the station is shown in the accompanying illustration. The station is built in the Grecian Doric style of architecture, opening through a colonnade into a loggia leading directly to the main waiting room and train concourse. The walls are faced with tapestry brick, trimmed with marble chip concrete.



LACKAWANNA'S NEW PASSENGER STATION AT MONTCLAIR, NEW JERSEY.



Plan of Milwaukee Terminals of the Chicago, Milwaukee & St. Paul.

The roof over the main waiting room is of green glazed tile, while that over the lower portion of the building is of red quarry tile; the latter material is used also for the floor of the loggia.

Particular attention has been paid to the ventilation, which is secured by register faces concealed by the trusses and by ventilated ridge tile directly connected through the roof beams with concealed openings in the purlins along the side walls. Illumination is secured by two large semicircular windows in the ends of the waiting room, while artificial lighting is provided by eight semi-direct hanging side lamps and four lamps placed in other positions.

Four platforms are provided, serving six tracks, each platform being 17 feet wide and 650 feet long, covered with reinforced concrete canopies for about 350 feet. The entrances to the driveways leading to the station are flanked by gate posts built of tapestry brick and surmounted by electric light fixtures of hammered copper. The driveways and all flower beds are curbed with concrete and the driveways are paved with creosoted wood blocks.

St. Paul's Terminal Improvements at Milwaukee.

THE St. Paul System has recently completed extensive terminal improvements at Milwaukee, involving the expenditure of about $750,000. The improvements are designed to relieve the congestion which has prevailed for some time at this point in the handling of freight traffic. In addition to a heavy local business, there is a large interchange business with car ferries and boats operating on the lakes. It is necessary to provide ample storage room in order to accommodate cars which must frequently wait several days. The accompanying illustration shows the general character of the problem and the way in which it was handled.

The first step taken was the building of a new eastbound receiving yard near Grand Avenue

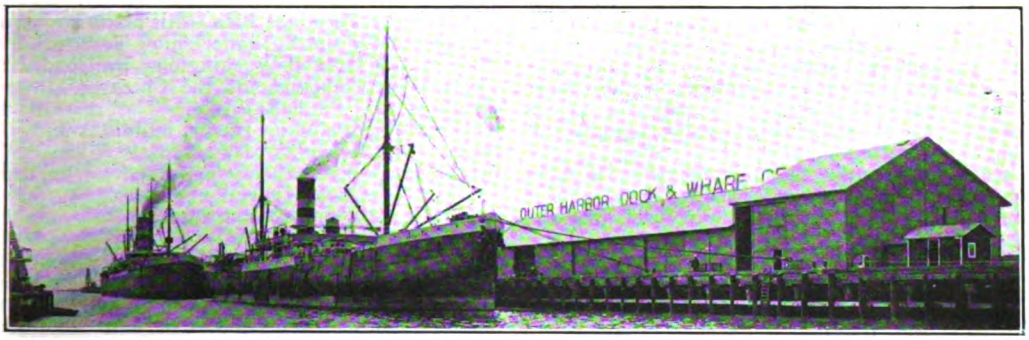
Digitized by Google

Junction in order to eliminate the back haul on the freight destined for the north and west sides of the city. Property was secured along the west bank of the Menomonee River from Grand aveiue south of the old La Crosse division on which this yard is being built. The river was moved eastward for about 2,000 feet and straightened to provide room for the tracks. With the exception of a small hill at the south end of the yard, which was cut down and the material placed in the embankment, the entire yard is built on a fill averaging 20 feet in height and requiring about 550,000 yards of earthwork. This material was loaded by steam shovels in gravel pits about 20 miles west of the city and brought in by trains. From Grand Avenue Junction four main tracks, two each for freight and passengers, extend south about 1,000 feet to the north end of the new yard. The passenger tracks turn east at this point, while the yard continues south almost to the old La Crosse division tracks, where it turns through an angle of approximately 90 degrees and terminates in a lead to the hump yard a short distance east. Six 80 car tracks extend the entire length of the yard. Eleven other tracks with a capacity of 50 cars each are provided, while four short tracks are built south of the main yards, where way freights can be handled without delay or interference to other traffic.

TERMINAL IMPROVEMENTS AT LOS ANGELES.

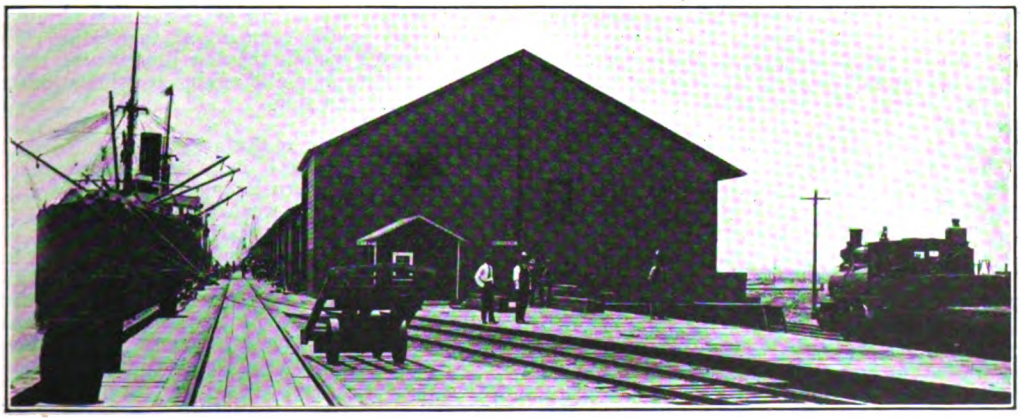
AT Los Angeles, the Outer Harbor Dock and Wharf Company have reclaimed about 157 acres of submerged lands in the outer harbor and are pioneers in constructing new and up-to-date facilities for the handling of the vast tonnage expected to arrive at the port upon the opening of the Panama Canal. This company has departed from the old and antiquated use of wooden piles in constructing their docks, having substituted therefor reinforced concrete, thus eliminating for all time the troublesome teredo and liminoria, the great ocean pests of the Pacific Coast.

A great feature, and one which appeals very forcibly to masters of large oceangoing ships, is the spring fender construction with which the docks are equipped, thus eliminating all strain to ships and docks. When completed, which will be in ample time for opening of the Panama Canal, this company will have about 14,000 feet of quay space; 2,900 feet on the east channel being already completed and in operation, at which are seen the great ships of the Harrison and Kosmos lines, plying direct from European ports to this coast.



OUTER HARBOR IMPROVEMENTS AT LOS ANGELES.

The facilities of surface tracks alongside steam-



SHOWING WAREHOUSES AND TRACKAGE AT SAN PEDRO, CALIFORNIA.

Digitized by Google

ers together with depressed tracks in rear of docks permits these ocean leviathans to discharge heavy and bulk freight direct from their slings to cars requiring this service, and at the same time work other hatches with package freight to cars on depressed tracks, thereby insuring the prompt dispatch so essential to all oceangoing ships.

There has been erected a warehouse 56 feet by 713 feet giving ample accommodation for storage of incoming and outgoing cargoes, and this will be increased as business develops and the expansion is warranted. The docks being situated on the west side are served by rails of the Southern Pacific Railroad and Pacific Electric Railroad in addition to which there will be a boulevard 100 feet wide running through the concession and connecting with the municipal harbor boulevard, all of which serves to give these docks transportation facilities second to none both by rail and motor truck.

A large space has been reserved for the location of great fireproof warehouses.

The minor lease covers an area of 5,000 feet in length and 1,150 feet wide at the southern extremity of the present water front of San Pedro and jutting out into the very mouth of the harbor. It is the key to the outer harbor occupying a place quite as advantageous as that held by the Huntington area, where the city proposes to build its municipal wharf No. 1.

The water frontage controlled by the Miner Company is 2,400 feet in a straight line on the eastern side of the channel which separates it from the Huntington area. Its frontage on the western side on the channel separating it from the city's 147 acres, is of the same length, but a basin 1,000 feet wide and running back into the fill for 900 feet has been left and eventually a mole or pier will be run out into this basin, thus giving space for four wharves instead of one.

Stewart wharf No. 1 on the land end of the east channel is completed. Kellogg wharf No. 2 with a warehouse is also completed. McPeak wharf No. 3 is ready for business, which completes the frontage on the east channel. The total length of these three wharves is approximately 2,400 feet.

The Garbutt wharf No. 4 is triangular in shape and lies at the sea end of the east side of the fill. Sheet piling will be driven here and this triangle will be ready for use within sixty to ninety days. It has 1,100 feet of frontage.

Adjoining the Garbutt wharf 1,000 feet has been reserved for the city. On the west channel Rust wharf No. 8, Purcell wharf No. 9 and Miner wharf No. 10 are completed on thirty feet channels, giving an additional frontage of 2,300 feet at the land end of the west channel and seaward therefrom.

Exact figures as to the expenditures of the corporation to date are not available, but it is understood that almost $1,500,000 has been spent. Part of the fill is now under lease to the Union Oil Company, and that corporation plans extensive improvements in addition to those made by the Outer Harbor Company.

To Improve Soo Line Terminals.—Enlarged connection facilities for the Soo Road and a series of improvements and new undertakings in and around Duluth are planned at a cost that will approximate $750,000.

Terminal Improvements at Cleveland. — The National River and Harbor Commission has under consideration, in connection with plans for lake front development in Cleveland, the establishment of a great union freight depot with a net work of switch tracks spreading out over land owned by the city and the railroads.

To Improve Passenger Facilities for Utica, New York.—In plans for the reconstruction of Utica's railway facilities the city is provided by the New York Central with a passenger station to cost $700,000, in addition to ample freight-house accommodations. The representatives of the city and the railroad company have reached a compromise in solving the problem.

Pennsylvania Railroad Improvements at Wilkinsburg, Pa.—Contracts have been awarded by the Pennsylvania for the elevation of its four tracks through Wilkinsburg, Pa., at a cost of $2,250,000. The work will probably be completed by January, 1915.

New Orleans Terminal Project of the Texas and Pacific.—Arrangements have practically been completed for financing the $10,000,000 terminal project of the Texas & Pacific in New Orleans.

Spokane's Terminal Plan.—All plans have been completed for the Spokane Union Terminal Station of the Oregon-Washington Railroad and Navigation Company and the Chicago, Milwaukee and St. Paul Railroad. The rest of the entire work, including tracks, buildings and viaducts, also the rights-of-way, totals $6,400,000, of which $2,000,000 is being expended on improvements. The work is well under way and excavating work is progressing rapidly.

New Shops for the Alton.—Ground was broken July 1st for the new shops of the Chicago and Alton in Bloomington. The plant will cost $1,000,000 and will replace the present antiquated buildings and machinery. Some time ago the management offered to construct new shops and a new depot, providing the city donated sufficient land. Citizens subscribed $165,000, and the land was purchased and turned over to the company.

Western Maryland's New Terminal at Cumberland Completed.—Improvement work costing thousands of dollars has been completed by the Western Maryland Railway at Cumberland, this work being a part of the extensive new terminals being built by the company at that point. The improvements include the new roundhouse, power plant, machine shop and engine terminals located at Maryland Junction.

Southern Pacific to Enlarge Freight Yards at Galveston. — A deal has been consummated whereby the Southern Pacific has acquired property located in the western part of Galveston, comprising two and a half city blocks and adjoining the freight terminus of the railroad company, which will enable both steamship and rail lines to handle city freight much more economically than now. The compress company has been desirous of securing more commodious quarters for some time. The deal involved $200,000.

Chicago Union Station Company Incorporated. —The Union Station Company, a $50,000,000 cor-

Digitized by Google

poration organized to maintain a Union Station in Chicago, has been incorporated.

The petition recited that three systems all entering Chicago, are desirous of forming a corporation to maintain a Union station. Shares to the amount of 500,000 at a par value of $100 each are to be issued, of which $25,000,000 worth will be held by the Burlington road and $12,500,000 by each of the other roads forming the corporation.

The incorporators are Darius Miller, president of the Burlington; A. J. Earling, president of the St. Paul, and Samuel Rea, president of the Pennsylvania. The directors for the first year are Joseph Wood and J. J. Turner, of Pittsburgh, and Mr. Miller and Mr. Earling.

It is announced that the new union station will be located on the west side, on the side proposed by the Pennsylvania group of railroads. Actual construction work will be started by November 1st.

Extensive Terminal Improvements for Philadelphia.—The removal of all grade crossings in South Philadelphia, a large increase in the port facilities of the city and other improvements at an estimated cost of more than $18,000,000 have been agreed upon at a recent conference at Philadelphia between city officials and representatives of the railroads affected. The city's share will amount to $9,796,000, while the Pennsylvania Railroad will expend $7,057,000 and the Baltimore & Ohio $1,904,800.

The plan, which will be worked out in detail by the attorneys for the city and the railroads during the summer for submission to councils next fall, includes the purchase of the railroad piers at Greenwich Point and Snyder avenue by the city and the erection of new freight yards and steamship terminals on what is now marsh land adjoining the Philadelphia Navy Yard on the north. About 4,000 acres of marsh land will be reclaimed for home and factory sites.

Baltimore Improvements of the Pennsylvania.—The following letter written by President Rea, of the Pennsylvania Railroad, to Mayor Preston, of Baltimore, briefly outlines the scope of the terminal improvements which that road proposes for that city:

"Philadelphia, July 23, 1913.

"Hon. James H. Preston, Mayor of Baltimore, Baltimore, Md.:

"Dear Sir:—My letter to you of May 27th last, on page three, contains the following statement:

"'The Calvert Terminal outlay, plus that for Bayview and Canton, will involve an expenditure, for property and construction, estimated at close to $10,000,000.'

"The 'Baltimore News' recently requested me to give it the details of this expenditure. I replied that the matter was entirely in your hands and I could not consistently give any. information, except to you, which I now do as follows:

"For revision of tracks and enlarged railroad yard in the vicinity of Bayview; for real estate, tracks, buildings and other railroad appurtenances, estimated expenditure	$3,200,000
"In the Canton district, for real estate, new coal pier, new yard tracks, buildings and appurtenances, estimated expenditure	2,800,000
"For Calvert terminal, under plans submitted with our proposal of May 27, we estimate that it will require for real estate, yard tracks, buildings, street and other improvements	4,000,000
"Total	$10,000,000

"To properly accommodate the traffic of the system, I feel that the above expenditure should be increased by $2,000,000 to fully effectuate our proposed plans, but this can be made in the future. Very truly yours,

"SAMUEL REA, President,"

Interstate Commerce Commission

Commission to Investigate Eastern Rate Situation.

THE Commission has issued an amended order in which it states that it will conduct an investigation in the Fall regarding the necessity of increasing the rates of the Eastern carriers. In connection with the issuance of the order the Commission makes two observations: (1) The fact that we have decided further to investigate this subject must not be taken as an intimation that the Commission has reached the conclusion that revenues are inadequate or that rates should be advanced. Upon this question no opinion has been formed. (2) That the statute gives to any party the right to attack by complaint any rate, and no general conclusion which the Commission may reach and announce in this investigation can affect that right.

In the preface to its order the Commission says that "being of the opinion from a consideration of the allegations of the petition that the need of and justification for additional revenue should be at the present time further examined," an inquiry is ordered into these points: "Do the present rates of transportation yield adequate revenues to common carriers by railroads operating in Official Classification territory? If not, what general course may carriers pursue to meet the situation?"

In dissenting from the decision of the majority to make the investigation, Commissioner Clements said: "Nowhere in the law is the Commission authorized to fix absolute or minimum rates. It is authorized to suspend pending investigation rates proposed by the carriers before they become effective, only when such proposed rates have been filed pursuant to the requirements of Section 6 of the Act, the provisions of which demand specific statement of the rates proposed. It is not contended that upon a general inquiry by the Commission such as is here instituted, it could enter an order requiring or authorizing an increase of rates; yet this is a proceeding for the avowed purpose, among other things, of inquiring whether the present rates of the carriers af-

Digitized by Google

ford adequate revenue. In my view, any expression of opinion on this question, following a general inquiry of this kind not based upon specifically proposed rates filed according to law, involves a determination of some of the most fundamental and important questions respecting the reasonableness of rates not before us, and contemplates the possibility of giving some sort of general sanction to advanced rates to be hereafter filed by the carriers."

Largely owing to the dissenting opinion above referred to, it is understood that the Eastern roads are now preparing new tariffs showing a uniform increase of five per cent in rates which they hope to have ready for filing early in the Fall. It was at first thought that the Commission's order would obviate the necessity of the railroads going to the heavy expense of preparing these tariffs, as it was at least intimated in the order that a horizontal five per cent increase, even should the Commission look favorably upon the carriers' demands, might not be found the desirable or practical method whereby the carriers might procure the necessary increase in devenues. Furthermore, recent decisions by the Supreme Court would appear to strengthen this contention. However, it has been decided to file the tariffs with the hope that such action will hasten the relief which is so necessary to enable the roads to properly conduct their business.

The favorable decision which resulted in the order to inquire into the Eastern rate situation, was reached by a bare majority, three of the Commissioners, Messrs. Clements, McChord and Marble, dissenting.

State Commissions to Assist in Physical Valuation.

AT a meeting of a special committee representing the National Association of Railroad Commissioners held recently at Chicago, it was decided to furnish all assistance possible to the Interstate Commerce Commission in its task of appraising railroad property throughout the United States.

All statistics in possession of State railroad commissions relative to the physical valuation of railway property will be placed at the disposal of the appraisal experts recently appointed by the Interstate Commerce Commission. In addition, representatives of the different commissions will be present at meetings of these experts.

For the purpose of making the valuation the Interstate Commerce Commissioners have divided the country into five districts, each district to be under the supervision of a member of the board of appraisers. Commissioner Prouty will have general supervision of the work.

The railroads also have perfected an organization to co-operate in the appraisal work. They have divided the country into three districts, and in each district three railroad engineers will devote their entire time to valuation matters. They will lend assistance to the appraisers in the employ of the Government. The railroads have chosen three lawyers and three real estate experts to co-operate with the engineers in each district.

Railroad Commissioners present at the meeting were Halford Erickson, Wisconsin; O. P. Gothlin, Ohio; Clifford Thorne, Iowa; George A. Henshaw, Oklahoma; Charles F. Staples, Minnesota; H. S. Martin, Kansas; Orville F. Berry, Illinois; C. L. Glasgow, Michigan, and H. T. Clark, Jr., Nebraska.

The stupendous character of the work involved in this physical valuation is emphasized in a statement issued by the Civil Service Commission, which is charged with recruiting the vast army of experts and other employes required for the undertaking. The first of the examinations in this new field of civil service employment, were held in all of the States and in the territories of Hawaii and Porto Rico, on July 21st and 23d. So great is the interest among those seeking employment that already about 20,000 inquiries have been received at Civil Service headquarters. From all parts of the country letters have poured in at the rate of from 600 to 1,000 daily since the announcement on June 14th of the first examination.

Not only will a large force be required to complete the initial work of appraising the valuation of all the railroads of the country, but after the final figures are obtained it is probable that a considerable number will be required to keep the information up to date. Thus it will be seen that the work about to be undertaken will be permanent for a great number of employes under the civil service.

Most of the positions pay good salaries, as Government salaries go, and this is obviously what has caused the large number of inquiries. Junior positions of architect, mechanical engineer, railway signal engineer, electric engineer and structural engineer will be paid from $1,080 to $1,500 a year. Junior positions of civil engineer, inspector of car equipment and inspector of motive power will pay from $1,200 to $1,500. Senior inspectors of car equipment and senior inspectors of motive power will receive from $1,800 to $3,600 a year. There will be two grades of each of senior structural engineers, senior civil engineers, senior electrical engineers, senior railway signal engineers, senior mechanical engineers and senior architects. The first grade will pay salaries ranging from $3,000 to $4,800 a year, and the second grade from $1,800 to $2,700.

As to the procurement of Army engineers to assist in this work, the Commission's request for assistance of this character has been refused by the Attorney General, who rules that there is no warrant of law for such diversion of the engineers from their legal duties. In order to put into operation the provisions of the law the Commission has asked for an appropriation of $1,500,000 in the deficiency bill now being prepared by the House committee.

A Ruling on the Marking of Packages.

THE Commission has issued a conference ruling relating to the markings of less than carload shipments which reads as follows:

"Besides being expressly so provided in the rules of all freight classifications, it is on broad, general grounds the duty of a shipper correctly to mark packages of less than carloads freight intended for transportation; and when so marked the carrier is held to a strict responsibility for their safe delivery at destination.

"In a case where a package of merchandise was addressed by the shipper to Lake City, Fla., instead of Lake City, S. C., it is held that the shipper making the error must bear the burden of the resulting freight charges; and the fact that

Digitized by Google

the correct address was noted on the bill of lading is not material."

The Commission also issued the following ruling relative to the shipment of dangerous articles:

"When cylinders containing inflammable gases are not boxed or crated for shipment, the safety device and discharge valve must be made safe from injury during transit by a design and construction of the cylinder, or they must be protected by strong metal caps that cannot be detached by rolling the cylinder.

"Carload or large less than carload lots loaded by the shipper, to be unloaded by the consignee, may be transported without crating or boxing, provided the cylinders are loaded compactly in an upright position and are securely braced to prevent any relative movement during transit, according to the general methods prescribed by B. E. pamphlet No. 6, for bracing shipments of explosives."

Further Developments in the Differential Controversy.

ACCORDING to reports from Boston, Commissioner Clark has declared that railroads centering at Boston are not obligated, under the recent decision of the Commission on port differentials, to raise their rates.

Commissioner Clark holds, it is said, that the Commission did not act as arbitrator between Boston and New York. Had it done so it might have been affected or even controlled by considerations which could not be taken into account at all while the Commission was acting officially in the discharge of its duties under the law.

In a statement issued by Mr. Ives and General Bancroft, who represented the city, they say a definite understanding was sought that an arbitral and a legal decision are incompatible and that Boston roads are under no obligation to advance their rates. Such an advance would mean that those from Boston alone would go up, thus throwing that city out of line, not only with New York, Philadelphia, and Baltimore, (the ports directly engaged in the controversy) but also all Canadian ports, and the South Atlantic ports, including Hampton Roads and the Gulf.

The statement further declares, in dealing with the difference between arbitration by the Commission and the consideration of rate cases from a legal standpoint, that a resolution favoring arbitration was adopted by the Commission without regard to the fact that New York commercial bodies declined to be parties to it. Later they filed a formal complaint making it the duty of the Commission to take cognizance and pass upon the same question in the discharge of their duties under the law.

The statement concludes:

"Having lost through legal technicalities our argument that the Boston rates should be reduced to the Baltimore basis, we stand willing to accept the opinion as given; namely, as a formal legal opinion but we see no reason whatever why we should likewise consider it an arbitral decision and submit to adjustment by having our rates advanced, when, under the law the Commission cannot compel an advance.

"While those representing the interests of Boston, including the railroads, believe that they have produced good reasons why—even from a strictly legal and technical standpoint—the rates from Boston should be lower than from New York, they urge the acceptance of the decision of the Commission, as rendered in good part."

Denver and Rio Grande to be Prosecuted.

THE Commission has issued a ruling in which it states it will recommend the prosecution of the Denver and Rio Grande Railroad for violation of the commodities clause of the railway rate law, on the basis that the railroad has been guilty of an unjust rate discrimination in its ownership of coal mines.

New Account Classification for Water Carriers.

COPIES of a "classification of income and profit and loss accounts for carriers by water," has been issued by the Commission and became effective July 1st. This is the first issue of such an expense account for water carriers, and the Commission announced that it is to be used by water carriers having annual operating revenues exceeding $50,000. It was further announced that "nothing in this order shall be construed as depriving a carrier of the right to make whatever analysis of income and profit and loss it may deem proper for the information of stockholders or officials who have the management of its property."

Besides the usual statistics of operation the water carriers were requested to separate an account of income from securities and other assets held in sinking and other reserve funds.

Concerning auxiliary operations the instructions of the Commission are as follows:

"Carriers by water operating facilities or rendering services other than those in connection with transportation by water or incidental thereto should treat such operations as auxiliary operations when the revenues and expenses thereof, if included in the carriers' accounts dealing with transportation by water, would impair the significance of statistics prepared from such accounts. Carriers should keep separate revenue and expense accounts for each operation conducted and include the aggregate of the revenue and the aggregate of the expenses of auxiliary operations in the respective accounts provided for them in the income statement.

"The following are some of the more important auxiliary operations conducted by carriers by water: Amusement parks and resorts; cab and omnibus service, and hotels and restaurants."

New Form of Trip Pass.

THE Commission has approved a new form of trip pass which is expected to prevent irregularities in the use of this kind of transportation. It was designed by an employe of the Rock Island lines, and consists of three parts: one for a single way trip, one for a round trip and one for two separate trips. In the process of filling it out there is registered on the back a carbon copy of the written matter.

Extent of Frisco Inquiry.

FORMAL investigation into the receivership of the Frisco System has been given by the Commission as follows:

"The Commission having been directed by resolution of the United States Senate, dated June

Digitized by Google

10, 1913, (Senate resolution No. 105 of the first session of the Sixty-third Congress), relative to the purchase of the Chicago and Eastern Illinois Railroad by the St. Louis and San Francisco Railroad Company, to investigate, if it has not the evidence on hand, and report to the Senate all the facts and circumstances concerning the purchase of the Chicago and Eastern Illinois Railroad by the St. Louis and San Francisco Railroad Company and the subsequent receivership of both railroads; such information to contain the amount paid per share for both common and preferred stock of the Chicago and Eastern Illinois Railroad by the St. Louis and San Francisco Railroad Company; the time of the issuance of such stock and the amount thereof; guaranties, if any, made with reference thereto; amount of the bonds issued by the St. Louis and San Francisco Railroad Company at the time of the purchase of the said Chicago and Eastern Illinois Railroad: the location of the holders of said bonds; the amount of the same held in this country and abroad, and all the facts and circumstances involved in any way in the transactions between said railroad companies; and all the facts and circumstances leading up to said receiverships, and the progress of said receiverships to date; also the names and the capitalization and bond issues of all railroad or bridge companies controlled by said St. Louis and San Francisco Railroad Company; the time of such acquisitions, how acquired, amount of bonds issued at the time of such acquisitions; and all facts or circumstances involved in such purchase or control; and it appearing that such an investigation involves also an inquiry under the Act to regulate commerce and the several Acts supplementary thereto and amendatory thereof into the management of the business of common carriers subject to the provisions of said acts and the manner in which the same is conducted.

"It is ordered that a proceeding of inquiry and investigation be and the same is hereby instituted into and concerning the several matters and things set forth and referred to in the said resolution, and into and concerning the general financial history, corporate relationships property and other investments, capitalization and indebtedness of the said St. Louis and San Francisco Railroad Company, Chicago and Eastern Illinois Railroad Company and their subsidiary and constituent companies.

"It is further ordered that this proceeding be set for hearing at such times and places, and that such persons be required to appear and testify or to produce books, documents and papers, as the Commission may hereafter direct and that the investigation be carried on in the meantime by such other means and methods as may be deemed appropriate.

"It is further ordered that a copy of this order be served upon the receivers of the said St. Louis and San Francisco Railroad Company and the receivers of the said Chicago and Eastern Illinois Railroad Company."

The Commission's Attitudes on the Parcel Post.

REGARDING the parcel post question the Commission has recently explained its position in correspondence to railroads as follows:

"The Commission does not consider that the provisions in the parcel post Act to the effect that certain changes may be made by the Postmaster General with the consent of the Commission, contemplated that the Commission shall necessarily hold hearings on such proposals, but when, after such investigation as it deems fit, the Commission is satisfied that the proposed changes are in order to promote the service to the public or to insure the receipt of revenue from such service adequate to pay the cost thereof, it is proper for the Commission to give its consent to the change.

"The question of compensation to the carriers for hauling the mails is a matter of contract between them and the Postoffice Department, in connection with which this Commission has no jurisdiction."

To Investigate New York Central's Bond Issue.

FORMAL order for an inquiry into the New York Central's proposed $167,000,000 bond issue to take up other bonds of that company and also stocks of the Lake Shore and the Michigan Central has been issued by the Commission, pursuant to a Senate resolution. Hearings at dates to be later announced, will be held. The Commission at the same time will investigate whether the consolidation of the roads, which would be affected by the proposed bond issue, would be unlawful.

Boston and Maine to Ask for Rate Increase.

PLANS are being made by the Boston and Maine Railroad to submit a request to the Commission asking for permission to make substantial increases in both passenger and freight schedules. The company will contend that the increases which will be sought are necessary to help the Boston and Maine regain its former position in the community to be able to properly serve the shippers, travelers and to regain its lost financial standing.

When the advanced rates have been filed the Commission is to consult with the railroad or public service commissions of Massachusetts, New Hampshire, Vermont and Maine, and it is expected that the arguments for granting the schedules will be made at joint sittings of these bodies.

The figures for New Hampshire, which have been prepared, show that of all traffic either beginning or ending in that State, 90 per cent is interstate and 10 per cent State. Probably the proportion of interstate business is less in the other States involved, but it is estimated that 75 per cent of the total traffic is subject to Federal regulation.

An Important Tap Line Decision.

A DECISION issued by the Commission in the case of joint rates with the Washington Western Railway in sustenance is as follows:

Cancellation of joint rates with a tap line incorporated by the proprietary lumber company for the purpose of getting allowances out of the rates sustained on a finding that with respect to the lumber of the proprietary company the tap line is a plant facility.

"In a lumber-producing territory, where the rates apply in all other instances only from the trunk line junctions with tap lines, it does not

Digitized by Google

necessarily follow that the protestant lumber company would be entitled to the group rates even if its tap line on the record was shown to be a full-fledged common carriers."

Lumber Storage Privileges Curtailed.

AN order has been entered by the Commission providing that shippers of shingles from the Northwest to points east of the Missouri River shall no longer be given the privilege of storage in transit at Minnesota transfer and other junction points. It has been the practice of the rail lines for ten years to allow both storage and reconsignment privileges in this traffic.

Ruling on Interurban Lines.

INTERURBAN electric lines operating between Louisville, Ky., and Indianapolis, Ind., have been ordered by the Commission to establish through routes and joint rates on less-than-carload shipments between the two terminal cities and to intermediate points. Specific class rates are prescribed by the Commission. This is the first time several lines, all operated by electricity, have been made the subjects of such an order.

Duluth Wins Rate Case.

DULUTH has won a substantial part of its freight rate fight before the Commission, by procuring a reduction of class rates to that city from Eastern points. The present rates were held by the Commission to be discriminatory. Duluth's contention that rates on lake-and-rail traffic from the East ought to break at its wharves, however, was not sustained.

In brief, the Commission held that the present rail-and-lake class rates to Duluth from points east of the Indiana-Illinois State line were unreasonable, and that the existing scale of through rail-and-lake class rates to Duluth was unduly discriminatory as compared with rates to Chicago. It was ordered that the first class rate from the East to Duluth should not exceed 62 cents a hundred pounds, and that the rates from Trunk Line territory to Duluth, rail-and-lake, should not exceed those to Chicago.

The Commission also held that the present joint through rail-and-lake rates from the East to Duluth deprived Duluth "of the advantage of its location at the head of the lakes" and resulted "in undue discrimination against Duluth, which will be relieved in some measure by the reduction here required."

The railroads were ordered by the Commission to submit tariffs by October 1 containing the changes directed, and also providing for the discontinuance of discriminations against Duluth and towns adjacent to Minneapolis and St. Paul caused by loose policing of transit privileges and long-and-short-haul violations.

Minneapolis Wheat Rates Declared Unreasonable.

THE Commission has issued a decision in the case of the Federal Milling Company against the Minneapolis, St. Paul and Sault Ste. Marie and other railroads holding that the rate on wheat from Minneapolis to New York via Lockport, N. Y., is unreasonable to the extent that it exceeded the rate contemporaneously in effect on flour. The decision says:

"The carriers expressed a willingness to put into effect a rate of 25 cents from Minneapolis to the East on wheat with the privilege of milling in transit at Chicago, in equalization of practically the same disability at Chicago of complainant at Lockport with respect to the 25-cent rate on flour east of Minneapolis. We find no justification upon this record for a higher rate on wheat than on flour between Minneapolis and New York City, and we think an arrangement similar to that proposed at Chicago should be made effective on wheat milled at Lockport."

Important Grain and Flour Decision.

IN a decision of the case of the Chicago Board of Trade against the Chicago and Alton and other railroads, the Commission holds that "proportion rate of 10 cents per 100 pounds on wheat from Minneapolis to Chicago to be neither unreasonable nor unjustly discriminatory.

"An arrangement under which Minneapolis pays 25 cents on flour to the East and to Central Freight Association territory, while Chicago must pay 10 cents more than Minneapolis for its wheat and 16.7 cents East on its flour, a total of 26.7 cents, is unjustly discriminatory and the discrimination should be removed.

"Chicago's failure to attract wheat in the same volume as Minneapolis is a disadvantage due to commercial rather than transportation conditions and is not chargeable to the defendants.

"Wheat, on the one hand, and barley, rye, oats and other coarse grains, on the other, do not constitute such 'like traffic' that a different charge for their contemporaneous transportation is violative of Section 2."

Lumber Rates Sustained.

THE Commission has sanctioned the proposed advance in the rate on lumber, staves and headings from Memphis, Tenn., to New Orleans, La. In connection with this case, the Commission made the further notation:

"Those parts of the fourth section applications of the Illinois Central Railroad and the Yazoo and Mississippi Valley Railroad asking permission to charge lower rates on lumber, staves and headings from Memphis to New Orleans than from intermediate points will be denied.

"Proposed advanced rates on lumber, staves and heading from points on the Illinois Central Railroad and the Yazoo and Mississippi Valley Railroad between Memphis and the line of the Southern Railway in Mississippi found not to have been justified in so far as they exceed 11 cents per 100 pounds.

"Proposed advanced rates on these products from points on the Illinois Central Railroad and the Yazoo and Mississippi Valley Railroad south of the Southern Railway in Mississippi found not to have been justified.

"Proposed advanced rates on gum lumber and staves from Helena and Arkansas City, Ark., found to have been justified.

"Proposed advanced rate from Alexandria, La., found not to have been justified in so far as it exceeds eight cents per 100 pounds."

The decision is to take effect August 20th.

Digitized by Google

New Haven Commuters' Case.

A DECISION has been handed down by the Commission in the Connecticut commutation rate case, holding that the commutation fares on the New York, New Haven and Hartford Railroad from points in Connecticut into New York City have not been found to be unreasonable with the exception as to stations within the 25 to the 35 mile zone. The report as written by Commissioner Harlan says:

"A careful examination of all the other fares in the New Haven commutation schedule fails to reveal any that is fairly open to criticism, when tested either by the fares of the Pennsylvania for similar distances or by the fares of any other of the New Jersey carriers, or when tested by any other matters shown of record. When the fares from points within that zone shall have been reduced to the basis here suggested the New Haven schedule as a whole will be slightly lower than the Pennsylvania schedule, the differential ranging from 25 cents at the nearer points to $1.15 at the more distant points. This is as it should be. The commutation traffic of the New Haven is very materially more dense than on the Pennsylvania. Giving due consideration to this and other facts shown of record, we think that the New Haven schedule of fares for this service may properly be somewhat lower than that of the Pennsylvania; and that is their basis at this time, with the exception of the fares in the 25-35 mile zone, which we have condemned as excessive."

Rate Suspensions.

AMONG recent rate suspensions ordered by the Commission are the following: Proposed 21-cent advance in freight rates on stave, splint and rattan baskets from points east to points west of the Mississippi River; proposed increase on freight rates on flaxseed ranging from 6 cents to 11½ cents from Minneapolis and other Northwestern points to Missouri River destinations; proposed increase in the rates of grain and grain products from points north of the Ohio and east of the Mississippi River, to destinations in other parts of the country found in freight tariffs filed by Central Freight Association; new tariffs of the Rock Island which propose to cancel through rates now in effect and applicable to the transportation of grain and grain products from points in Chicago, St. Louis and Mississippi rate territory to stations located on the Ft. Smith and Western Railway in Oklahoma; proposed advances in rates on coal from mines in Indiana and Illinois to points in Iowa; proposed advances in rates on structural and bridge iron and steel stopped in transit for fabrication at fabricating points on the Wheeling and Lake Erie Railroad; proposed cancellation of through rates from and to stations on the Kansas City and Memphis and points on or reached by the St. Louis and San Francisco Railroad; proposed advance in lumber rates and articles taking lumber rates, from points in Wisconsin, Louisiana, Oklahoma and Texas points in Iowa, Wisconsin and other States; proposed advances in rates on crushed stone from points in Illinois to various points in Indiana and Michigan; proposed advances on fruit and vegetables between California and Nevada and other Western States.

TRAFFIC AND RATES.

General Traffic Conditions.—Whatever the outlook is for general business, and there can be no doubt that at the present time there is a general feeling of hesitancy, it is having no effect upon the tonnage of the railways. With grain crops in a healthy condition and largely in excess of those for 1912; with the cotton crop estimated at nearly 14,000,000 bales and with the export business of the country running far ahead of what it was last year, the real problem which is facing the railroads is not how to procure business, but how to successfully handle that which is already in sight. Railroads all over the country are busy and never at this season of the year have Western and Southwestern railroads moved as many cars, all well loaded and paying a good revenue. So far, this enormous business is being handled without delay and with satisfaction to shippers, and few of the roads, as yet, are operating up to their full capacity, but from the way business is moving it looks as though they would be in the near future. While little or no talk of car shortage or congestion is heard at the present time, it is, nevertheless, receiving the earnest consideration of traffic officials who appreciate that with the bumper grain crops to be moved every facility must be strained to the utmost in order to avoid the deplorable conditions of past years.

The latest report of the Bureau of Foreign and Domestic Commerce, shows that during June, merchandise left the shores of this country for foreign consumption to the value of $163,000,000 as compared with $138,000,000 in June, 1912. On the Great Lakes the tonnage passing through the Sault Ste. Marie Canal during June amounted to 12,113,613 tons against 10,747,159 tons in 1912. In the east the anthracite coal shipments from Pennsylvania for the same month totalled 5,970,047 tons as against 6,191,646 tons for the same month in 1912.

Isthmian Traffic.—Trans-isthmian traffic via the Panama and Tehuantepec railroads, amounted to approximately 132 million dollars value in the fiscal year 1913, against 21 million in 1907, 42 million in 1908, 62 million in 1909, 82 million in 1910, 103 million in 1911, and 141 million in 1912. The decrease of about 10 million dollars in 1913 as compared with 1912 is due to a large reduction in the value of sugar sent from Hawaii to the eastern coast of the United States. In the west-bound traffic the figures for 1913 are five million dollars greater than those of 1912, but in the east-bound traffic there is a reduction of approximately 15 million dollars, due chiefly to a fall in both quantity and price of sugar sent from the Hawaiian Islands to the eastern coast of the United States; though certain other articles from the Pacific coast of the United States also show a slight reduction in 1913 compared with 1912.

Freight Rate Increases.—Tariffs providing for a general increase in freight rates of five per cent will be filed some time early in the Fall by railroads operating in Central Freight and Trunk Line territories. The various rate committees and clerks are busily engaged revising these rates at the present time.

Revision of Passenger Fares. — A revision downward of interstate passenger fares has be-

Digitized by Google

gun by Western and Central Passenger Associations in compliance with an order by the Interstate Commerce Commission that the new rates will be made effective May 1, 1914. Passenger officials of railways entering Chicago, state that it is doubtful if the task of revising the tariffs can be completed within the time limit prescribed by the Commission.

The long and short haul clause of the Interstate Commerce law which prohibits a higher charge for a through rate than the aggregate of the local fares, became effective July 1, 1910, but the Commission suspended the time for its enforcement.

To Stop Free Freight Delivery.—The Pennsylvania Railroad Company will, on September 1st, discontinue the practice of free delivery of freight in both Washington and Baltimore. These heretofore have been the only cities in the United States enjoying free delivery. It is the view of the railroad company that as the conditions what one time justified this privilege, no longer prevail, the practice should now be abandoned.

The present arrangement was originally adopted in both cities as a temporary expedient. The practice in Baltimore, was established in 1870 and free delivery was inaugurated for the prompt relief of the cars and warehouses of the railroad company.

The company says:

"Under the Interstate Commerce Act it becomes necessary for the railroad companies to standardize their practices and seek uniformity of method throughout their operations. It is but proper therefore to eliminate the exceptions at Baltimore and Washington and put these two cities upon the same basis in the matter of freight delivery as other cities in the United States."

Boston and Maine to Ask for Rate Increases.—Boston & Maine Railroad freight and passenger rates are being revised and the Interstate Commerce Commission will be asked to approve substantial increases. The Commission will consult with the railroad commissions of Massachusetts, Maine, New Hampshire and Vermont, with which it will hold joint hearings.

The new schedules will show what part of the traffic affected is interstate and what part is state. The figures for New Hampshire, already prepared, show that of all traffic either beginning or ending in that state, 90 per cent is interstate and ten per cent state. The company will contend that the increase is necessary to carry out the contemplated improvements on the Boston & Maine and to meet maturing obligations.

Important Changes in the Operation of the Parcel Post.—The Post Office Department has announced important changes in the operation of the parcels post system, including an increase in the maximum weight limit on packages from eleven pounds to twenty pounds, a reduction in the rates of postage within the first and second zones and the substitution of a convenient rate chart for the elaborate parcels post map in determining postage rates.

It is understood that concerted opposition has developed in Congress to these changes, and that there is likely to be a bitter contest over their becoming effective. It is the opinion of some members of Congress that such a change would entail an enormous loss to the Government, and that the Post Office Department has thus far failed to furnish either branch of the legislature with satisfactory data concerning the financial operation of the parcel post.

Friction between Congress and the Postmaster General is said to have arisen over several points. The Senate Committee is said to be chagrined because the Postmaster General announced his proposed changes before sending the committee a reply to a request for his opinion on the Bryan bill. Consideration of the bill had been delayed pending his response. The joint committee to investigate parcel post, composed of members of the Senate and House Post Office Committees, is dissatisfied, too, because the request of its chairman, Senator Bristow, several weeks ago for data in regard to the operation of the new parcel post has brought no results.

Low Grain Rates to the Seaboard.—For the first time probably in twenty years the lowest lake and rail rates available from Chicago to New York cannot fully compete with the present all rail freight basis from the Missouri River and Chicago to Baltimore and Philadelphia. The two last named cities enjoy an all rail rate on export wheat of 1½ cents and one cent respectively, lower than that from the West to New York. The Buffalo and New York railroads have declined to reduce the all rail rate Buffalo to seaboard. Present conditions are for allowing a free business all rail from Chicago to Baltimore, which would be impossible with only a very small fractional reduction in the present extremely high Buffalo-New York rate. Baltimore has been a heavy buyer of all rail wheat for shipment from Chicago and also bought for all rail shipment from St. Louis.

ORGANIZATION NOTES.

Campaign for Uniform Mileage Book.—The Travelers' Protective Association has named a railroad committee with instructions to campaign for a uniform mileage book good on all railroads in the United States. The trunk lines east of the Rocky Mountain district have been divided into four additional districts, each represented by a member from the committee. Other districts are the South Atlantic States; the States of Ohio, Indiana, Michigan, Texas, Louisiana, Arkansas and Missouri; Wisconsin, Minnesota, Iowa, North and South Dakota, Nebraska and Kansas.

Annual Meeting of the Society of Railway Financial Officers.—The annual meeting of the Society of Railway Financial Officers for the year 1913, will be held at the Hotel Moraine, Highland Park, Illinois, on September 23rd, 24th and 25th. The first session will convene at 2.00 o'clock P. M. on September 23rd.

Highland Park is situated on the west shore of Lake Michigan about twenty-three miles due north from the center of Chicago. It is a very attractive place, having excellent hotel facilities, splendid golf links and other attractions.

Flint, Michigan, Transportation Club.—The Transportation Club of Flint, Mich., was organized with the following officers: President, M. E. Kinball, of the Buick traffic department; vice-

Digitized by Google

president, F. E. Badger, of the J. B. Armstrong Co.; secretary, W. O. Reynard, of the Weston-Mott Co.; treasurer, J. S. Tennant, of the Durant-Dort Co.

Annual Election of the Railroad Club of Kansas City.—The annual election of officers of the Railroad Club of Kansas City, resulted as follows: President, T. Percy Bryan, of Gray & Bryan; vice-president, George E. Roe, general agent, A. T. & S. F. Ry.; Samuel C. Wilson, superintendent Mo. Valley Demurrage and Storage Bureau; secretary, Claude Manlove; treasurer, Ewing Duval, general agent, C. G. W. Ry.

Meeting of Southwestern Passenger Association.—At a meeting of the Southwestern Passenger Association, held at St. Louis, July 9th and 10th, an understanding was reached to concur in certain amendments to the baggage rules, which had been recommended by the standing committee on these rules at a conference in Chicago the latter part of June. Drum cases and cylinders, which had been eliminated as sample baggage, were reinstated.

It was also understood that the October meeting of the Southwestern Passenger Association would be held in St. Louis at a date to be later fixed.

The same general basis of winter tourist fares was adopted by southwestern lines as had been previously in effect, with the usual selling dates and limits, and circulars will be issued at as early a date as convenient.

The usual docket of routine subjects was submitted for consideration, but definite conclusions were not reached.

For the G. A. R. gathering at Chattanooga in September, a rate of two cents per mile in each direction was established added to the tender of the Southeastern lines.

Central Freight Association Meeting.—At Chicago, on July 15th, changes in class and commodity rates in the territory east of the Mississippi and north of the Ohio rivers, were discussed at the meeting of representatives of railroads affiliated with the Central Freight Association. A number of increases and several reductions in rates were approved.

To Extend "Safety First" Movement.—A wide extension of the "Safety First" movement on railroads throughout the United States is expected as a result of plans perfected by the committee on transportation of the American Railway Association.

At the present time about one-half of the rail lines have safety organizations and an effort is being made to induce the others to form safety committees as soon as possible.

It is proposed that on each road there shall be a central safety committee, composed of the general and division officers of the company. This committee will be assisted by division, shop and terminal safety organizations. The officers of the latter will hold their positions permanently, but changes among employe members will be made at intervals, with a view of giving all employes an opportunity to become familiar with safety plans. Employes who act as members of any of the committees will be paid their wages in full while attending meetings, and also will be compensated for any expenses incurred while performing this duty.

Among those engaged in promoting the plan are: R. C. Richards, general claim agent of the Chicago and Northwestern Railway; George Bradshaw, general safety agent of the New York Central lines; W. B. Spaulding, claim attorney of the St. Louis and San Francisco Railroad, and S. J. Peterson, general claim agent of the Union Pacific Railroad.

Farewell Dinner to Mr. B. L. Winchell.—Receiver B. L. Winchell of the Frisco, was given a farewell dinner at the St. Louis Club by the chief executive officers of the Frisco family at St. Louis headquarters. It was a simple, sincere expression of good will on the part of the men who had labored with the president of the Frisco for several years past, all of whom hold the retiring chief in the highest esteem and regard and wish him all success in assuming the duties of the foremost position in the traffic world.

Passenger Fare Controversy in Iowa.—The Western Passenger Association, which had hoped to maintain a minimum fare of two cents a mile in States where the law fixes two cents a mile as the maximum fare, has sent a committee to Des Moines to consult Clifford Thorne and other members of the Iowa Railroad Commission regarding the new law providing a fare of 1½ cents a mile to and from county fairs and other gatherings where the attendance is 75,000 or more. The committee presented arguments as to why two cents a mile should be the minimum in Iowa.

Campaign for Legible Shipping Orders.—A campaign to induce shippers to furnish railway companies with legible shipping orders is being conducted under the auspices of the Chicago Association of Commerce. A committee has been appointed to confer with officers of various trade organizations for the purpose of urging business firms to require clerks to prepare shipping orders so they may easily be read. The committee also will ask shippers to use more care in packing freight and marking shipping boxes.

International Congress of Refrigeration to Meet in September.—Thousands of delegates from all over the world are expected to attend the third international congress of refrigeration, which will be in session from September 17th to October 1st.

The Congress in reality is set for Washington and Chicago. The opening meeting will take place in the capital city on September 15th, with President Wilson as the chief speaker. Then the foreigners attending will be rushed to Chicago on a special train for the sessions to be held here. The congress will bring to Chicago leading scientists, diplomats and experts on refrigeration from all points of the compass.

The congress is held every three years in different countries. It was inaugurated in 1908 at Paris, and in 1910 was held in Vienna.

American Railway Tool Foreman's Association Elects Officers.—A. M. Roberts, of Greenville, Pa., was chosen president of the American Railway Tool Foreman's Association at the closing session of the annual convention and other offi-

Digitized by Google

cers were elected as follows: Vice-presidents, Henry Otto, of Topeka, Kan.; J. J. Shehan, of Roanoke, Va., and E. P. Purchase, of Springfield, Mass.; secretary and treasurer, A. R. Davis, of Macon, Ga.

Change in Rules Regarding Sleeping Car Berths.—A change in existing rules that will curtail the time within which advance reservation for sleeping car berths may be claimed was advocated at a meeting of the executive committee of the Western Passenger Association in the Transportation Building. Instead of holding reservations until ten minutes before trains depart, it was suggested that they be canceled at least an hour prior to train time. The Pullman Company will be requested to draft a series of recommendations on the subject and final action, it is expected, will be taken at the next meeting of the committee.

Meeting of Central Passenger Association.—Passenger traffic officials and attorneys of the roads comprising the Central Passenger Association met in Chicago on July 24th, in the office of F. C. Donald, chairman of the association, to discuss ways and means of revising interstate passenger fares. Several methods were discussed and the matter finally was left to a committee.

St. Louis Business Men's League Advocates Rate Increase.—The St. Louis Business Men's League—composed of 2,500 leading business men of that city—has adopted a resolution that

"Whereas, certain railroads in what is known as official classification territory have in effect requested from the Interstate Commerce Commission permission to advance their freight rates uniformly five per cent, and whereas we believe that the railroads are not now receiving sufficient revenue to enable them to perform under present conditions service adequate to the needs of the commerce of the country.

"Therefore, be it resolved that this league hereby request the Commission to grant to these railroads as promptly as circumstances will permit, permission to advance freight rates in the uniform manner set forth in their recent petition upon presentation of such figures as will prove the necessity of such increases."

Annual Convention of International General Foremen's Association.—W. W. Scott, of the Delaware, Lackawanna & Western Railroad, East Buffalo, N. Y., was chosen president of the International General Foremen's Association at the ninth annual convention in Chicago. Other officers elected for 1913 are:

First vice-president—T. F. Griffin, Big Four Railroad, Indianapolis.

Second vice-president—L. A. North, general foreman, Illinois Central Railroad, Chicago.

Third vice-president—William Smith, New York.

Fourth vice-president—William Gale, Chicago & Northwestern Railroad, Chicago.

Secretary and treasurer—William Hall, Chicago & Northwestern Railroad, Escanaba, Mich.

President B. F. Bush Addresses San Francisco Commercial Club.—At a recent luncheon of the San Francisco Commercial Club, President B. F. Bush, of the Missouri Pacific, whose authority has been extended to include the presidency of the Western Pacific, delivered an address in which he alluded to the attitude of the people and the government toward the transportation companies of the United States. He said: "The railroads of this country are down now, and they can not—they will not—go ahead making improvements and building extensions until the public sentiment has changed. The railroads require and must have the hearty support of the American people. We ask for your co-operation."

LEGISLATION.

National.—The tariff continues to consume the greater part of the attention of Congress. Business is apparently marking time awaiting the final action taken on this question, and the party whip is being cracked in order to carry things along as expeditiously as possible.

The most important development of the month, so far as the railroads are concerned, was the passage by the House and Senate of the Newland's amendment to the Erdman Act. As finally agreed upon, this act provides that whenever a controversy rises between railroads and employes that cannot be settled by conciliation, dispute is to be submitted to an arbitration board of six, employers and employes each naming two arbitrators and the four thus chosen to pick the other two. If they fail to name the two the choice shall be left to a Board of Mediation and Conciliation. This board instead of being under the Department of Labor is to be independent of every Government department. The board will consist of a Commissioner of Mediation and Conciliation to be appointed by the President for a term of seven years and two other officials of the Government to be designated by the President.

The appointment of this board and other matters relating thereto, are found more fully discussed in another section of this issue.

Efforts were made by Secretary Wilson of the Department of Labor, to have the chairman of the board come under the jurisdiction of his department, but this effort was defeated and as the law stands, the chairman and its members are independent of all departmental influences.

Senator Poindexter, of Washington, has introduced a bill authorizing the President to construct a railroad in Alaska and to mine coal in that territory. The President is to be authorized to borrow $50,000 for the purpose outlined. The bill would propose that hereafter no coal mines shall be disposed of except under lease.

The whole problem of enacting into law suitable regulations to prevent interstate railroads from doing anything in the way of financial operation aside from holding their own stock and securities and thus to prevent the carriers from continuing the practices of owning or purchasing controlling interests in competing lines not necessary to their legitimate development, has been thrown into the hands of Congress by the Interstate Commerce Commission's findings in the investigation into rates, regulations and practices on the New England lines, according to opinions expressed by railroad officials.

On July 10th, Senator Norris, introduced a resolution in the Upper House calling upon the Interstate Commerce Commission to investigate and report on the proposed issue by the New York Central Railroad of $167,102,400 four per

Digitized by Google

cent mortgage bonds for the purpose of taking up outstanding 3½ per cent bonds of the New York Central and against the stock of the Lake Shore and Michigan Central railroads.

The resolution read as follows:

"Resolved, That the Interstate Commerce Commission be instructed to investigate, if it has not the information now in hand, and report to the Senate all the facts and circumstances connected with the proposed issue by the New York Central & Hudson River Railway of four per cent mortgage bonds for $167,102,400 for the purpose of taking up outstanding 3½ per cent bonds now existing against said railroad and the stock of the Lake Shore and Michigan Central railways.

"That the Commission be instructed to furnish the Senate with date and amount of said 3½ per cent mortgage bonds, the reason for their issue, when they mature, whether the issuing of the said four per cent bonds for the said 3½ per cent bonds will not be an unwarranted and illegal capitalization of said railroads, whether the proposed consolidation of said railroads involved in the said proposed issue of four per cent bonds would not be unwarranted and unlawful, and whether the increase of the rate of interest thus proposed by the issuing of said four per cent bonds is necessary, even though the consolidation of said railroads is unobjectionable."

Representative Sims, of Tennessee, has again let it be unmistakably known that he had not abandoned his fight for the abolition of the Commerce Court. He declared he would renew his effort to eliminate the tribunal at the earliest possible moment consistent with the condition of the court's docket.

Senator Chilton has draughted a bill which would prevent a joint ownership of all roads. The bill as it is understood in Washington, is the direct out-growth of the Union Pacific merger case.

An amendment to the laws relating to the issuance of bills of lading by interstate carriers is asked in a bill introduced by Representative Kahn, of California. The amendment provides that all action or suits brought to recover loss, or for damages under a bill of lading shall be begun within one year after the goods covered are damaged or lost.

Senator Martine, who took a prominent part in the West Virginia coal strike investigation, has introduced a draft of a bill to prohibit corporations engaged in interstate commerce from employing armed men. The bill aims to put an end to mine guards and armed railroad detectives.

New York.—Although the Public Service Commission of New York has requested Governor Sulzer to ask the extraordinary session of the legislature, to appropriate $1,250,000 as the State share in the eliminating of grade crossings on the Long Island Road, the Governor has asserted that in all probability he would not make the request. He said, however, that probably some arrangement would be decided upon whereby the First District Public Service Commission would be given authority to enter into contracts for the grade crossing elimination on Long Island without taking any more money from the State Treasury this year, as, he declared, the money would not be needed for two years. Such authority, he explained, would prevent any delay in beginning the work.

The Governor has sent the following message regarding the New York City terminals act to the legislature:

"During the regular session the legislature passed a bill amending transportation corporations law, by making provision which prohibits railroads or express companies from acquiring control in any way of freight terminal companies, shall not apply to freight terminal companies, shall not apply to corporations in the City of New York.

"My approval of this bill was urged by city authorities for the purpose of permitting adequate operation of proposed marginal terminal railway in Brooklyn. The bill, in the form in which it passed the legislature, was not limited in operation to Brooklyn, but affected all five boroughs which was unnecessary for the accomplishment of stated purpose, and I vetoed it.

"I approved certain measures passed by legislature, amending New York City freight terminals act, relative to water front facilities in New York City, which specifically related to contemplated Brooklyn terminal improvement. Authorities of the city of New York and the State Engineer, after careful examination of the situation, have advised me that the plans agreed upon and contemplated by the municipal authorities for efficient operation of terminals on South Brooklyn water front cannot be consummated without statutory authority permitting railroad companies to hold stock in terminal freight companies in Brooklyn.

"I feel convinced that the proposed development is of the greatest importance to the Port of New York and to business interests of Brooklyn, and believe it is but proper for this Legislature to afford means necessary to grant the city authorities power for a complete establishment and efficient operation of this great proposed freight terminal.

"Under the circumstances I recommend to the legislature for its favorable consideration, an amendment to the law that will permit and secure joint operation of the proposed terminal railroad in accordance with plans contemplated and approved by municipal authorities of the city of New York."

Massachusetts.—The legislature of Massachusetts has passed a law empowering the New York, New Haven and Hartford to own, operate and extend electric railways in the western part of the state—the law covering, it is said, all of the city and interurban lines west of Worcester. This law was adopted on June 12th by very large majorities in both houses, after it had been vetoed by the governor. On June 12th, also the governor vetoed the bill to enlarge the number of men in the Railroad Commission, to change the title of the Commission, and to give it many new powers and this law also was soon adopted over the governor's veto.

Under the new law, which is called the Washburn law, the Railroad Commission becomes the Public Service Commission and will have five members instead of three. It gives extensive power of regulation of railways, similar to those of the public service law of New York, and the board will have the same authority to enforce its orders reducing rates, etc. There is the usual elaborate prohibition of free passes and free

Digitized by Google

service. The Commission is specifically authorized to order changes in the number of men in train crews. Two sections concerning which there was much controversy and the terms of which were given by the governor as the chief reasons for his veto, sections 15 and 16, authorizing railways to incur indebtedness equal to twice the amount of their capital stock, but every act of a corporation in financial matters is under the close supervision of the Commission.

STATE COMMISSIONS.

Arizona.—The Corporation Commission has denied the petition of the Southern Pacific Railroad to issue $30,000,000 of trust notes, but it is announced that this action has no bearing on the $20,000,000 Southern Pacific one-year notes recently purchased by Kuhn, Loeb & Co.

The Corporation Commission has granted permission to the El Paso & Southwestern Railroad Company to consolidate the six companies comprising the system, which controls 458 miles of road in Arizona and 440 miles in New Mexico.

California.—By a decision of the Railroad Commission, the State takes unto itself the power to regulate the rates of steamship companies plying over regular routes from one California port to another, even though the ships making such trips traverse the high seas.

Canada.—The Railway Commission has issued regulations standardizing safety appliance equipments to conform to the requirements of the United States as set forth by the Interstate Commerce Commission.

Illinois.—A sweeping revision of the freight classification is now being made by the State Railroad and Warehouse Commission. This is the first revision of the classification in Illinois since 1906 and on account of the immense amount of work involved it is expected that fully nine months will elapse before the task can be completed. One of the features of the new classification will be an increase in carload minimum weights for certain commodities. Thirty-five general rules which will govern the compilation of the new classification have already been adopted. Hundreds of changes will be made in descriptions and package specifications and in the course of the work it will be necessary to analyze thousands of items.

Iowa.—Railroads operating throughout Iowa have decided to apply to the State Commission to contest the validity of the law passed at the last session of the legislature which provides that a fare of 1½ cents a mile in each direction shall be the maximum charge for the transportation of passengers to county fairs and all other gatherings where the attendance is 75,000 or more.

Maryland.—Application of the Union Pacific Railroad Co. and the Oregon Short Line Railroad Co., a subsidiary, to acquire $21,273,600 of common stock and the same amount of preferred stock of the Baltimore & Ohio Railroad Co., now held by the Pennsylvania Railroad Co., has been granted by the Public Service Commission.

Answers to complaints of representatives of various small towns along the line of the Western Maryland Railroad, about the changes in schedule caused by the installation of the through service to Pittsburgh and Chicago, have been filed with the Public Service Commission.

Massachusetts.—The new State Transportation Commission, which replaces the Railroad Commission, has been appointed by Governor Foss.

The membership of the board, and the periods of service are: Frederick J. McLeod, of Cambridge, five years; George W. Anderson, of Boston, four years; George P. Lawrence, of North Adams, three years; Clinton White, of Melrose, two years; George W. Bishop, of Newton, one year.

Missouri.—The State Public Service Commission has been requested to pass upon the question whether the railroads may legally exact three cents a mile from passengers who proffer cash fare on trains instead of a ticket. Complaints have been made to the Commission by persons who say they boarded the trains without tickets and were charged three cents a mile although tickets are on sale for two cents.

The Public Service Commission has ruled that the railroads were entitled to issue free transportation only to such local employes as were employed by the companies and who devote a portion of their time to work for the roads. The companies could employ only such local attorneys as were necessary to do its work.

The Commission also ruled that two bondsmen for common carriers would be permitted free transportation in each county, limited to the counties for which they were appointed.

The State Public Service Commission has begun an inquiry as to whether the Commission has power to establish coal rates by zones so that mines nearest the market may not be able to secure a monopoly in the sale of coal and shut out their competitors.

D. B. Pigg, of Calhoun, a coal operator, complained that the Missouri, Kansas & Texas Railroad charges 70 cents a ton to Nevada from Calhoun, a distance of 62 miles, and 60 cents a ton from Calhoun to Sedalia, a distance of 28 miles.

Application has been made to the Public Service Commission by the Kansas City Terminal Railway Company for permission to issue $5,000,000 of five per cent notes.

New Jersey.—The Public Utilities Commission has refused to sanction the lease of the West Jersey & Seashore Railroad to the Pennsylvania Railroad.

The stockholders of the West Jersey & Seashore on April 30th last, voted to lease the road to the Pennsylvania for 999 years from July 1, 1913. The rental was to cover interest on bonds or other debt, dividends at six per cent yearly on the common stock, payable semi-annually, 1½ per cent to be paid July 1st, and also on special guaranteed stock, dividends on stock to be issued under the lease and on stock of constituent companies under the consolidation agreement of February 28, 1896.

In its decision the Commission said that approval was not necessary and dismissed the application.

New York.—The Public Service Commission has denied the application of the New York Central & Hudson River Railroad and several

Digitized by Google

of the Brooklyn rapid transit companies for a rehearing on the order made by the Commission April 25th, requiring all public service corporations using high tension electric apparatus to adopt certain safety appliances and to take certain precautionary measures to protect their employes against injury from electric apparatus or steam engines or boilers.

Oregon.—The State Railroad Commission has begun an investigation of the demurrage rates of railways, it being alleged by the lines operating in the State that the charge of $2 a day for cars held beyond the time limit by shippers was insufficient. The railroads declare that the charge should be $3 a day.

West Virginia.—The Chesapeake & Ohio has asked the Public Service Commission for permission to increase its passenger rates in that State, on the ground that the law fixing two cents a mile as the maximum is confiscatory.

LEGAL.

Mileage Books in New Hampshire.—The Attorney General at New Hampshire has filed in the Superior Court of that State a bill in equity in the name of the State of New Hampshire, asking the Court to issue a writ of mandamus to compel the Maine Central road to issue 500-mile mileage books and to place them on sale at all its stations.

The legislature at the recent session passed a law requiring all steam railroads operating a passenger service in the State to issue 500-mile mileage books at the rate of two cents per mile, good for the transportation of the bearer over all the steam railroad lines of the State and to keep them on sale at all ticket offices.

The road holds the law unconstitutional and has therefore refused to comply with it.

Illinois Central Sued by Mississippi. — The State of Mississippi has brought suit at Clarksville, Miss., against the Illinois Central and the Yazoo & Mississippi Valley Railroads, asking $50,000,000 in penalties for alleged violation of a law forbidding consolidation of parallel and competing lines of railroads, and demanding that the two roads be ordered to cease doing business in the State.

President Markham in discussing the case said he did not believe there was any cause for alarm. "The merger was declared to be valid in a tax suit some time ago. When the suit is tried I have no doubt we will be able to justify the coalition of those lines. The entire matter will be placed in the hands of our law department."

Minnesota Rate Injunctions Dismissed.— The United States Circuit Court at St. Paul has dismissed the injunctions relating to seven railways in Minnesota, and officially restored to effective operation the Minnesota two-cent passenger rate and commodities laws and cleared the way for consideration of the cases of the three roads not affected by the mandates of the United States' Supreme Court.

The roads affected in the injunctions are the Great Northern; Northern Pacific, Chicago, St. Paul, Minneapolis & Omaha; Chicago, Milwaukee & St. Paul; Chicago, Rock Island & Pacific; Chicago & Northwestern and the Soo Line.

The case of the Chicago Great Western was held not to be affected by the ruling of the higher court since its earnings have not been sufficient to warrant the enforcement of the two-cent rate.

The Minneapolis & St. Louis, in whose case the supreme court held the rates confiscatory, can change such rates as it desires to meet competition but is not compelled to make a refund. The Minnesota & International Railway Company will not be compelled to make a refund but will return to the two-cent rate.

Wilson Administration after Telephone Lines. —The first important suit under the Sherman anti-trust law by the Wilson Administration, has been filed at Portland, Ore. It is aimed at the American Telephone & Telegraph Company and its subsidiaries, known as the Bell companies. It is designed to bring about the dissolution of the so-called telephone mergers on the Pacific Coast, through which the Bell companies, it is charged, have established a monopoly of the telephone business in the states of Oregon, Washington, Montana and Idaho.

The Federal Government seeks to bring about the divorcement from the Bell companies of nine which formerly operated as independents and which it is charged, have been driven into an amalgamation with the Bell companies since 1905. These nine companies, formerly independent, represent investments of many millions of dollars.

Chesapeake and Ohio's Fare Petition Dismissed.—On motion of the Attorney General, the Circuit Court of West Virginia, has dismissed the bill of review filed by the Chesapeake & Ohio Railway Company, last month in the two-cent fare case. Under a former order of the court the railway company must redeem all coupons issued for fares collected in excess of two cents a mile on presentation at its offices in Charleston, Huntington and Hinton.

Anti-Trust Suit Against the Missouri, Kansas & Texas.—Judgment for $15,000,000 against the Missouri, Kansas and Texas Railroad, is asked and a suit filed in the District Court at Austin, Texas.

Violations of the Texas anti-trust laws is alleged. The Missouri, Kansas & Texas, of Kansas; the same organization in Texas; the Dallas, Cleburns & Southwestern Railroad Company; the Denison, Banham & New Orleans Railway, and the Texas Central Railway are made defendants.

The state charges that by its coalition with other roads, the Missouri, Kansas & Texas, of Kansas, has created a monopoly in Texas and has so routed passengers and freight as to compel their transportation over the controlled lines.

Power of California Commission over Security Issues Questioned.—The Southern Pacific Company, in a suit filed in the United States District Court at San Francisco, attacks the right of any single state to regulate the power of an interstate corporation to raise funds for disbursement in various states. The company seeks an injunction restraining the California Railroad Commission from asserting jurisdiction over a contemplated issue of equipment trust certificates

Digitized by Google

aggregating $6,000,000 to be raised in New York and spent in several Western States.

The complaint contends that if the right is granted to any one State to declare void securities issued without the approval of that State's delegated agent, such right must be conceded to all States. Such a condition, it is held, would set up a conflict of authority which would make impossible any general plan of finance satisfactory to all Commissions.

The action was taken for the purpose of making a test case of it in order that a precedent might be established for future issues of securities. It is understood that the case will be carried to the highest court for decision so that the road may be in a position to know in the future just exactly where it stands with respect to the issuance of securities. It is also stated that the result of the court's findings will be an important element in connection with the future plans of the road as well as other important systems throughout the country.

Effort to Enjoin Iowa Commission.—An injunction has been sought by the Chicago, Rock Island and Pacific and the Chicago Great Western, representing all roads operating in Iowa, to prevent the State Railroad Commission from enforcing its orders that railroads should grant a rate of 1½ cents for the State Fair in August.

To Contest Validity of Illinois Headlight Act.—The validity of the Illinois headlight act is being tested in the courts at Danville, Ill. This law requires all railroads to place on their engines electric headlights of high power. This measure was backed strongly by the labor forces of the State. It was one of the few railroad measures to become a law.

It was attacked on the grounds that it is unconstitutional because Congress has the sole power to legislate concerning the equipment of locomotives doing an interstate business. Another basis for the injunction filed against it in the United States District Court here is that since it was to go into effect last week it would give insufficient time for railroads to equip with the new headlights.

The Louisville & Nashville Railroad, which filed the injunction preventing the enforcement of the law, alleged that it would take several months' time and a large expenditure of money to complete such equipment.

Union Pacific Loses Titles of Lands.—The Supreme Court of Colorado has reversed the decision of the District Court of Weld County, which had sustained the title of the Union Pacific Railroad Company to a strip of land 400 feet in width, and extending on both sides of its right of way. In its decision the Supreme Court said that while the District Judge stated the law correctly at the time his decision was made in 1909, according to the rulings in similar cases by the Federal Supreme Court, the Norris law, enacted by Congress, June 24th, 1912, is retroactive in cases where settlers and others have procured title to the land embraced within the right of way when the land previously had been abandoned, or had not been utilized by the railroad for the legal seven-year period of limitation.

Valuable lands located within the disputed strip in Colorado, Wyoming, Kansas and Nebraska are affected by the Norris law, and the decision of the Colorado Supreme Court is expected to establish a precedent for the settlement of similar cases in other States.

OBITUARY.

Francis Halsey Adams, formerly general storekeeper for the Chicago & North Western Ry., by which road he had been employed for more than forty years, died recently at his home in Chicago, at the age of 60.

Gordon A. Aird, who for twenty-five years was general agent of the Atchison, Topeka & Santa Fe Ry., died at his home in Chicago, July 15th.

Alexander Brown, signal engineer of the Chicago, Milwaukee & St. Paul Ry., died at his home in Milwaukee, July 7th.

G. H. Eaton, assistant master car builder of the Canadian Pacific Ry., died recently at his residence in Winnipeg, Man. Mr. Eaton has been connected with the mechanical department of the above railroad for many years, spending the last seven years in Winnipeg as assistant master car builder. Prior to 1906, he was stationed at Farnham, Que., as superintendent of the car shops at that point. Mr. Eaton, who was born in Stafford, England, was 53 years of age at the time of his death.

Edward S. Cramp, formerly vice-president of the William Cramp and Sons Ship Building Company, died in New York on June 20th. Mr. Cramp was born in Philadelphia in March, 1853. His father and his grand-father, William Cramp, founder of the ship yards, were also born in Philadelphia. Mr. Cramp graduated from the Central High School of Philadelphia, in 1871, and in September of the same year, he was apprenticed to the engineering branch of Cramp and Company, and began work at the bottom. After serving four years in this branch, he became an expert machinist and leaving the machine shop went to the draughtsman table, where for seven years he drew plans and worked over the details of the big vessels which the company were then commencing to build. After seven years' training in the draughting department, Mr. Cramp was placed in charge of the erecting department. He was then made superintendent of the plant, and from this position he rapidly rose to general manager of the entire ship yard and then to the position of vice-president. He retired from active business a few years ago and moved to New York.

Mr. Cramp was a member of the Union League, Rittenhouse Club, Art Club, Country Club, the Metropolitan Club of Washington. He was also a member of the American Academy of Social Science, the American Society of Engineers and the Naval Architects.

Thomas J. Fitzgerald, formerly resident engineer of the Southern Pacific at Ogden, Utah, died in that city on June 24th, aged 67 years. Mr. Fitzgerald was connected with the Central Pacific and Southern Pacific from October, 1868, until about January, 1912, when he retired owing to ill health and was placed on the pension list of that company.

John Heimrich, president of the Great Southern R. R., died at his home in Portland, Ore., June 11th, aged 67 years.

David S. Hill, formerly from April, 1882, to February, 1900, general superintendent of the Lake Erie & Western at Indianapolis, Ind., died on July 1st, at Detroit, Mich., aged 72 years. Mr. Hill began railway work in 1858, and filled various minor positions with the Michigan Central and Louisville, New Albany & Chicago until September, 1871, when he became assistant superintendent of construction of the Cincinnati, Lafayette & Chicago. Later he was trainmaster and superintendent of the Lafayette, Bloomington & Muncie until April, 1880, when he was made division superintendent of the Lake Erie & Western. In April, 1882, he was promoted to general superintendent, which position he held until February, 1900, when he was appointed assistant chief engineer of that road. He retired from active railway service in January, 1901.

James C. Haugh, resident engineer of the New Orleans & Northeastern R. R., was killed in an automobile accident at New Orleans, La., Sunday, July 6th. Mr. Haugh was born in Cincinnati, O., in 1855 and was connected with the city engineer's office for a short time. He later became identified with the Cincinnati Southern Ry., and was engaged in the construction of that road. When it was taken over by the Cincinnati, New Orleans & Texas Pacific, he was transferred to the New Orleans & Northeastern. He supervised the construction of the six-mile railroad bridge over Lake Pontchartrain, near New Orleans, and was president of the Engineers' Club of Louisiana.

Edwin Tracy Jones, auditor of revenue of the Southern Railway, with headquarters at Washington, D. C., died in that city on June 16th. He was born at Decatur, Ala., and was educated in the public schools of his native town. He began railway work at the age of 16, as a messenger on the Memphis & Charleston, now a part of the Southern, and then to 1885 held various clerical positions, including that of ticket agent. In 1885 he was in the local office of the same road at Memphis, Tenn., and subsequently was chief clerk and cashier of the Chesapeake & Ohio Southwestern at Memphis, returning to the service of the Memphis & Charleston in 1888, as assistant agent at Decatur, Ala. The following year he entered the auditor's office of the same road at Memphis, and then to 1895 was consecutively cashier of the Louisville, New Orleans & Texas, now a part of the Yazoo & Mississippi Valley, and agent of the Tennessee Midland, now a part of the Nashville, Chattanooga & St. Louis, at Memphis. From 1895 to 1898, he was with the Mallory Steamship Company at Galveston, Tex., and in October of the latter year, was made a clerk in the freight auditor's office of the Southern Railway. In June, 1901, he was appointed auditor of freight accounts, and since July, 1904, was auditor of revenue of the same road. Mr. Jones was in good part responsible for the unusually efficient organization of the Southern Railway auditor of revenue's office.

W. J. Maxwell, grand secretary and treasurer of the Order of Railway Conductors, died at his home in Cedar Rapids, Iowa, on July 14th. He was 54 years old, and had occupied his position with the Conductors' Order for fifteen years.

Paul R. MacKinnon, traveling passenger agent of the Chicago, Rock Island & Pacific at Denver, Colo., died recently at that place.

William K. McAllister, general agent of the Southern Pacific at Denver, Colo., died in that city on June 12th, aged 63 years. Mr. McAllister had been connected with the Southern Pacific since 1893, and was made general agent in March, 1895.

G. McRoberts, division foreman of the St. Louis & San Francisco at Salem, Mo., died on July 10th, aged 56 years.

E. W. Moore, superintendent of the St. Louis division of the Mobile & Ohio, with headquarters at Murphysboro, Ill., died in the latter city on June 17th. Mr. Moore was born in 1862 at Keokuk, Iowa, and began railway work in 1877 as brakeman on the Keokuk & Des Moines Valley. He was subsequently until October, 1890, brakeman and conductor on the Cairo & St. Louis and the Mobile & Ohio. From the latter date to August, 1902, he was trainmaster of the St. Louis division of the Mobile & Ohio, and was then made superintendent of that division.

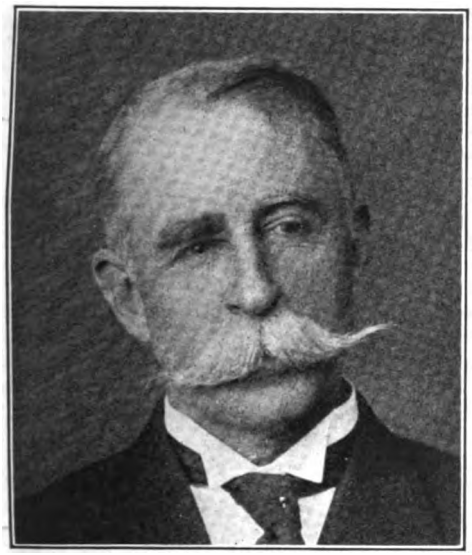
Gavinus McReynolds, age 56 years, for 32 years in railroad service, first with the Vandalia and then with the Texas Pacific, and for the past eleven years master mechanic of the Frisco's Salem branch, died on July 11th.

Daniel S. Newhall, purchasing agent of the Pennsylvania Railroad, who died on July 12, 1913, was born in Germantown, Pa., April 7, 1849, and was educated in private schools. After taking a course in the chemical laboratories of Messrs. Booth & Garrett and Prof. F. A. Genth, he began his business career as an apprentice in the Pennsylvania Sugar Refinery, at Race and Crown Streets, Philadelphia, of which he was superintendent at the time of its destruction by fire in 1870.

Mr. Newhall continued in the sugar refining business, from 1870 to February 1882, and was a member of the firm of McKean, Newhall & Borie, at the old Lovering Refinery, Church Alley. On February 21, 1882, he was elected assistant secretary of The Pennsylvania Railroad Company. He was superintendent of the Employes' Saving Fund from the date of its organization in 1887; secretary of the Manor Real Estate and Trust Company; assistant secretary of the Philadelphia, Wilmington and Baltimore Railroad Junction Railroad and Philadelphia and Baltimore Central Railroad Companies.

Digitized by Google

On June 1, 1898, Mr. Newhall was appointed purchasing agent of the company, on the death of Mr. A. W. Sumner.



DANIEL S. NEWHALL.

Walter T. Payne, foreign freight agent of the Norfolk and Western Railway, died in Norfolk, Va., on June 7th. Mr. Payne was the oldest official of that company by seniority of service, having been in its employ for forty-seven consecutive years.

M. J. Power, general storekeeper of the Canadian Pacific Ry., eastern lines, died recently at the Royal Victoria hospital in Montreal. Prior to becoming general storekeeper, Mr. Power was for twelve years, chief clerk to Sir Thomas Shaughnessy, the president of the road. Mr. A. A. Goodchild has been acting as general storekeeper, during the illness of Mr. Power and will probably succeed to the position.

Henry F. Rice, a former general superintendent of the Chicago, Rock Island & Pacific Ry., died at his home in Des Moines, Iowa, June 7th.

Dr. William Taussig, president of the St. Louis Bridge Company, director of the St. Louis Union Trust Company and organizer and former president of the Terminal Railroad Association of St. Louis, died on July 10th, of pneumonia, after an illness of several weeks, at his home in St. Louis, Mo., at the age of 87. He was born in Bohemia and was graduated from the University of Prague in 1844. He came to St. Louis a year later and was graduated in 1850 from the St. Louis School of Medicine. He was an active practitioner for thirteen years. In 1852 he was elected mayor of Carondelet. He served as judge of the St. Louis County Court from 1859 to 1865 and from 1863 to 1865 was the presiding judge. In 1866 he became president of the Traders' Bank. He was one of the organizers of the St. Louis Bridge Company, which built the Eads bridge, and of the Terminal Railroad Company. He was president of the Terminal Railroad Association from its organization in 1889, until 1896.

J. H. Taylor, general superintendent of the Lake district of the Great Northern Ry., with headquarters at Superior, Wis., died at his home in that city, July 14th. Mr. Taylor was born at Hancock, N. Y., September 15, 1865. He entered railway service in 1879. After holding various positions with several lines and previous to going to Superior with the Erie R. R., last as superintendent of the Delaware division at Port Jarvis, N. Y., he went to the Great Northern as superintendent of the Mesabe & Superior division at Superior, November, 1904. Mr. Taylor had been general superintendent of the Lake district since March 15, 1912, having just previously held the same position at Great Falls, Mont., the headquarters of the Central district of the Great Northern.

Henry Martin Thompson, one of the first three railroad commissioners of the State of New York, died on Monday, July 14th, at his home in New York at the age of 71.

Henry Wilkes Walker, retired general auditor of the Grand Trunk Ry., died in Winnipeg, Man., June 10th, aged 74 years.

Herman Wheeler, retired, but formerly assistant general passenger agent, Chicago & Northwestern Ry., for a time general agent at Denver, Colo., and, in later years, because of ill health, assistant general agent of the same road at Denver, died recently in New York.

ELECTIONS AND APPOINTMENTS.

Executive.

Frank Andrews, receiver, St. Louis, Brownsville & Mexico Railroad.

W. T. Armstrong, president, Texas City Terminal Company.

B. S. Barker, vice-president and general manager, Gainesville & Northwestern Railroad. Headquarters, Gainesville, Ga.

E. L. Brown, vice-president, Western Pacific. Headquarters, San Francisco, Cal.

Benjamin F. Bush, president, Western Pacific Railroad.

Lewis L. Clarke, director, Hudson & Manhattan Railroad.

A. J. County, director, Philadelphia, Baltimore & Washington R. R.

George W. Davison, director, Hudson & Manhattan Railroad.

Roy Dillon, vice-president and general manager, Texas City Terminal Company.

D. C. Douglass, assistant to the president, Maine Central Railroad.

Pliny Fisk, director, Hudson & Manhattan Railroad Co.

R. J. Foreman, assistant to the vice-president, Grand Trunk Railway. Headquarters, Montreal, Que.

Elbert H. Gary, director, Hudson & Manhattan Railroad Co.

Jerome I. Hanauer, director, Hudson & Manhattan Railroad Co.

Alexander J. Hemphill, director, Hudson & Manhattan R. R.

Edward T. Jeffery, chairman of the board, Western Pacific.

Felix Johnson, vice-president, Houston & Bra-

zos Valley Railroad. Headquarters, Freeport, Texas.

Fred. M. Kirby, member of board, Lehigh Valley Railroad Co.

Morris McDonald, president, Boston & Maine and Maine Central Railroads.

R. W. Meirs, director, Hudson & Manhattan Railroad.

Frank J. Moore, president, American Association of General Baggage Agents.

W. C. Nixon, receiver, St. Louis & San Francisco Railroad. Headquarters, St. Louis, Mo.

W. G. Oakman, director, Hudson & Manhattan Railroad.

J. M. Parker, receiver, Arkansas, Louisiana & Gulf Ry.

J. W. Platten, director, Hudson & Manhattan Railroad.

G. H. Schleyer, receiver, St. Louis, San Francisco & Texas Railroad.

Dan D. Schrenck, president, Toledo & Indiana Railroad. Headquarters, Toledo, Ohio.

Charles R. Thompson, assistant to first vice-president, Texas & Pacific Railway. Headquarters, New Orleans, La.

Avery Turner, receiver, St. Louis, San Francisco & Texas Railroad. Headquarters, Amarillo, Texas.

Lucius Tuttle, chairman of the board, Boston & Maine Railroad.

J. Q. Van Winkle, assistant to vice-president Bernet, Cleveland, Cincinnati, Chicago & St. Louis. Headquarters, Cincinnati, Ohio.

W. H. Williams, director, Hudson & Manhattan Railroad.

Legal.

Edward W. Beatty, general council, Canadian Pacific Railway. Headquarters, Montreal, Que.

E. H. Boles, general solicitor, Lehigh Valley Railroad. Headquarters, New York.

Henry C. Hall, attorney, Arkansas, Louisiana & Gulf. Headquarters, Colorado Springs, Colo.

Edson Rich, assistant general solicitor, Union Pacific. Headquarters, Omaha, Neb.

Financial.

L. G. Burress, paymaster, Chesapeake & Ohio Railroad. Headquarters, Richmond, Va.

E. R. Cobb, secretary, Houston & Brazos Valley Railroad. Headquarters, Freeport, Texas.

J. P. Finkenaur, secretary, American Refrigerator Transit Company.

H. E. Fisher, treasurer, Boston & Maine Railroad.

J. A. Hancock, assistant treasurer, Chesapeake & Ohio. Headquarters, Richmond, Va.

T. D. Heed, assistant treasurer for the receivers, Chicago & Eastern Illinois Railroad. Headquarters, New York City.

J. F. Meyers, assistant treasurer, Oregon-Washington Railroad and Navigation Company. Headquarters, Portland, Oregon.

George C. Morris, treasurer, Houston & Brazos Valley Railroad. Headquarters, Freeport, Texas.

J. H. Weaver, treasurer, Western Virginia Northern Railroad.

J. E. Wilkinson, assistant treasurer, Western Virginia Northern Railroad.

Accounting.

W. H. Burns, general auditor, Malvern & Camden Ry. Headquarters, Chicago.

B. J. Corson, auditor and freight claim agent, A. L. & G. Ry. Headquarters, Monroe, La.

J. B. Duke, auditor of revenue, Southern Railway. Headquarters, Washington, D. C.

Arthur P. Foss, comptroller, Maine Central. Headquarters, Portland, Me.

L. E. Hodson, assistant freight auditor, Minneapolis, St. Paul and Sault Ste. Marie. Headquarters, Minneapolis, Minn.

T. C. McCampbell, acting auditor and acting treasurer, Tennessee, Kentucky & Northern Railway. Headquarters, Nashville, Tenn.

J. J. McEwen, Jr., auditor of disbursements, Missouri, Kansas & Texas Railway of Texas. Headquarters, Dallas, Texas.

J. E. O'Neill, auditor, Galveston, Houston & Henderson Railroad.

T. L. Shelton, auditor of station accounts, Southern Railway. Headquarters, Washington, D. C.

Engineering and Mechanical.

J. W. Acker, gang foreman, Rock Island's Cedar Rapids roundhouse.

P. E. Anderson, roadmaster, Walla Walla and Pendleton branches, Northern Pacific. Headquarters, Pasco, Wash.

A. G. Andrew, assistant supervisor, division No. 30, Pennsylvania Railroad. Headquarters, Barnesboro, Pa.

A. G. Armstrong, master mechanic, Arizona division, Atchison, Topeka & Santa Fe Ry. Headquarters, Los Angeles, Cal.

T. N. Armstrong, road foreman, engines, Chesapeake & Ohio Railroad. Headquarters, Lexington, Ky.

J. F. Ashworth, master mechanic, Tennessee Valley. Headquarters, Oneida, Tenn.

Lee Barnes, assistant roadmaster, St. Paul division, the Northern Pacific.

Henry Barnett, general mechanical superintendent in charge of shops, rolling stock and machinery, Boston & Maine Railroad.

E. S. Barnum, general foreman, Pennsylvania Lines west of Pittsburgh. Headquarters, Xenia, Ohio.

M. K. Barnum, general mechanical inspector, Baltimore & Ohio.

F. D. Batchellor, district engineer, maintenance of way, the Cincinnati, Hamilton & Dayton Railway.

R. A. Becket, superintendent of signals, Grand Trunk Railway. Headquarters, Montreal, Que.

R. A. Bellingham, master mechanic, Apalachicola Northern. Headquarters, Ft. St. Joe, Fla.

B. A. Bertenshaw, district engineer, construction department, Cleveland, Cincinnati, Chicago & St. Louis Ry. Headquarters, Middletown, Ohio.

O. S. Beyer, Jr., general foreman, Chicago, Rock Island & Pacific Railway. Headquarters, Horton, Kansas.

William Bibby, assistant general roadmaster, Central Vermont Railroad. Headquarters, St. Albans, Vt.

W. A. Rizor, foreman of water service, Chicago, Burlington & Quincy R. R. Headquarters, Greybull, Wyo.

VOL. LVII. SEPTEMBER, 1913 No. 9

Important Developments in the Transportation Field

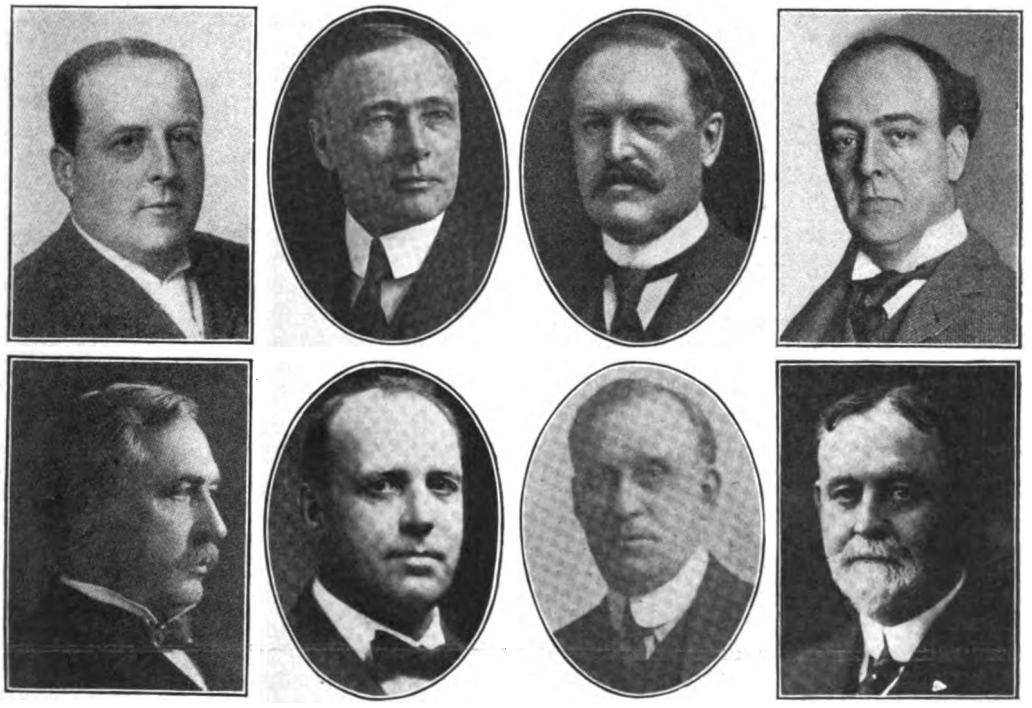
RAILWAY MAIL PAY DEVELOPMENTS

The relations between the Postoffice Department and the railroads became so strained during the past month, on account of the methods employed for computing the compensation for railway mail service, that the Toledo, St. Louis and Western Railroad notified the Department that it would discontinue the transportation of mail at the end of sixty days. At the time this notification was given it was rumored that other roads would take similar action, and that council had advised the carriers that they were acting within their legal rights in refusing to perform a service for a part of which no compensation had been granted. It developed, however, that other roads, while entirely dissatisfied with the Government's attitude on this question, were not prepared to take the extreme measures threatened by the Toledo, St. Louis and Western, which road in fact decided to withdraw its refusal, although protesting strongly against the unfairness of the present methods.

Later in the month the executives of seventeen Western railroads, including the more prominent trunk lines throughout the West and Middle West, at a meeting held in St. Louis, sent the following telegram to the Postmaster General:

To Hon. A. S. Burleson,
Postmaster General,
Washington, D. C.

The undersigned are prompted respectfully to



UPPER ROW.

Darius Miller President, Chicago, Burlington and Quincy.	W. C. Nixon, Receiver, St. Louis and San Francisco.	S. M. Felton, President, Chicago Great Western.	Frederic A. Delano, President, Wabash Railroad.

LOWER ROW.

A. J. Earling, President, Chicago, Milwaukee and St. Paul.	Benjamin F. Bush, President, Missouri Pacific.	Walter L. Ross, President, Toledo, St. Louis and Western.	B. A. Worthington, President, Chicago and Alton.

Eight of the seventeen Western Railway Executives who in August sent a telegraphic protest to the Postmaster-General at Washington against the present methods employed in computing railway mail pay.

Digitized by Google

ask you to consider, whether the United States Government is really dealing fairly with the railroads of the country, as to the matter of pay in connection with the introduction and extension of parcel post service.

The testimony of the Postoffice Department before the Senate Committee, July 25th, showed that the first three months' business of the Department, after the installation of the parcel post, had a gross increase in postal revenue of 14.54 per cent, of which at least 9.16 per cent was attributed to the new parcel post business.

(NO PAY *for Parcel Post First Six Months*):

On the basis of this statement, the Government must have collected not less than $11,266,800 in revenue from the parcel post for the first six months, beginning January 1st.

As this was before any arrangement had been made to reimburse the railroads for taking care of this new feature of the postal service, not one dollar of this big return was paid to any of them for transporting the entire business referred to.

(PAY *for* ONLY HALF *Parcel Post Business)*:

To remunerate the transportation companies for the additional parcel post business transported, Congress provided, beginning July 1st ,a five per cent gross increase in their mail pay, based upon rates, zones and weight limit, in original act, although the additional business transported, amounted to at least 9.16 per cent, according to the testimony of the Postoffice Department, or nearly double that provided in the allowance.

(NO PAY FOR *Extension Parcel Post, August 15th*):

The extension of the parcel post, to be inaugurated August 15th, when the weight limit is to be raised from eleven to twenty pounds, rates greatly reduced and mileage increased, is certain to result in a vast enlargement of business.

The Government will collect postage on this business but no provision has yet been made to pay the railroads for transporting it. Not only will they receive no compensation for this increased business, but will suffer the actual loss of earnings, previously derived from the same traffic, when carried as express or freight.

No code of business requires service without pay, and it is especially unreasonable for the United States Government to require the railroads or any other interest, to serve it without any remuneration.

Congress is in session, and can immediately remedy this condition, in accordance with suggestions made by the Committee on Railway Mail Pay in letter to you, July 30th ,which we endorse and urge upon your consideration.

Postmaster General Burleson, in reply to this telegram, addressed a letter to the officials involved, in which he stated that he would do all in his power to see that the railroads get adequate compensation for every service they render in carrying the mails. He declared that he would go as far as they would in an effort to see that they procure absolutely fair treatment, but that he would be equally solicitous in seeing that they do not receive one dollar more than they are entitled to. However, his letter when examined carefully does not appear to uphold his declaration for absolutely fair treatment. For example, in discussing the provision made for additional compensation on account of the inauguration of the parcel post system, he says:

> In view of the conditions pertaining to the inauguration of the parcel post system, Congress made special provision from the first of July, 1913, by which the Postmaster General is enabled to make a readjustment within the limitation of 5 per cent of the compensation paid on July 1, 1913, upon routes which were not weighed after January 1, 1913, and without incurring the very large expense of a reweighing of the mails. All other routes were weighed at the regular weighing and readjusted on that basis. It must be presumed that this action by Congress in allowing additional compensation from July 1 was intended as adequate payment for service performed from January 1 to June 30, 1913, as well as for such service from July 1, and the Department so regards it.

This increase, the railways assert, is nearer ten than five per cent. Further along he asserts that:

> I am prepared to say now, however, that I do not favor your suggestion for semi-annual weighings. Such a plan would increase the payment to railroad companies for the carriage of the usual mails by paying additional compensation for the increase in the mails between the regular quadrennial weighings. As stated above, it has been the belief that the quadrennial readjustments amply compensate the railroad companies for the service performed during the four-year period.

This attitude of course is unsatisfactory to the carriers, as it virtually dismisses two of the principal points involved in a fairer adjustment of railway mail pay. The whole matter is now, however, in the hands of the Congressional Commission before whom the railroad companies have had a hearing and it is to be hoped that this Commission will recognize the fairness of the railways' contentions, and recommend legislation which will remedy the unfairness in the present methods.

ARBITRATORS SELECTED FOR EASTERN TRAINMEN'S WAGE CONTROVERSY

The month's important development in the Eastern trainmen's wage controversy, has been the appointment of the men who are to compose the Board of Arbitration. The six members of the complete Board are: For the railroads, A. H. Smith, second vice-president of the New York Central Lines, and W. W. Atterbury, of the Pennsylvania Railroad. For the employes, L. E. Sheppard, vice-president of the Order of Railway Conductors, and D. L. Cease, another brotherhood officer. Seth Low, president of the National Civic Federation, and Dr. John H. Finley, president of the College of the

Digitized by Google

A. H. SMITH,
Senior Vice-President, New York Central Lines.

W. W. ATTERBURY,
Vice-President in charge of operation Pennsylvania Railroad.

D. L. CEASE,
Editor of the *Railway Trainmen*.

L. E. SHEPPARD,
Vice-President, Order of Railway Conductors.

The representatives of the railways and the railway employes on the Board of Arbitration chosen under the Newlands Act to settle the Eastern Trainmen's Wage Controversy.

City of New York, are the two neutral members selected by the representatives of the railroads and the men. The Board will begin its hearings in September, and the arbitrators must, under the Newlands law, order their award within forty-five days from the date of the first hearing.

It is a matter for congratulation to all parties concerned that the Board is splendidly constituted to handle the questions involved, and their decision will no doubt throw much light upon a question which has been sorely perplexing railway managers during the past year. It is particularly fortunate that the services of Mr. Low could be procured, as he is not only admittedly one of the greatest authorities of the country on economic matters, but his judicial and impartial frame of mind, eminently fits him for work of this character. In view of the great importance and public necessity of the controversy, he has agreed to serve, at a great sacrifice to his personal affairs.

HONORABLE SETH LOW.
President of the National Civic Federation who has agreed to act as chairman of the Board of Arbitration.

DOCTOR JOHN H. FINLEY.
President of the College of the City of New York, who has been chosen as sixth arbitrator.

DESTROYING AN INDUSTRY

While the express companies may be able to survive the joint attack of a reduction in rates and parcel post competition for which, by the way, the Government at the present time is not paying the railways adequate compensation, there can be no doubt that

Digitized by Google

COMMISSIONER JOHN H. MARBLE,
who prepared the express rate decision.

these developments have caused an enormous destruction of capital which it will prove well nigh impossible to re-establish by any means at the disposal of this industry.

A full abstract of the Commission's order is found in another section of this issue. It is practically identical with the Commission's decision of June 8, 1912, written by Commissioner Lane, now Secretary of the Interior. Perhaps the most important change is by way of modification of the present graduated scale of parcel post rates. 100-pound rates for short distances have been either left unchanged or slightly reduced, while for longer distances they have been lowered. Again for 50 pounds or less, all rates have been practically reduced. For packages more than four pounds going more than 200 miles and less than 2,000 the new express rates are generally lower than the parcel post rates; for more than 3,000 miles the rates are practically the same.

By prescribing a so-called block system, dividing the United States into 950 blocks, averaging 2,500 square miles, as originally proposed by Mr. Lane, millions of different rates now published by the express companies will be reduced to less than 650,000, and the Commission believes that the system points the way to a solution of the existing maze of freight rates.

The following interesting table prepared by the New York *Times* makes a comparison between the present express rates, the proposed rates and the parcel post rates, between New York and certain other cities:

FOR PARCELS WEIGHING ONE POUND.

	Express		Parcel
	Present	Proposed	Post
Denver	$0.30	$0.26	$0.11
New Orleans	.30	.24	.10
Chicago	.25	.23	.09
Augusta, Me.	.25	.22	.08
San Francisco	.30	.31	.12

WEIGHING TEN POUNDS.

	Express		Parcel
	Present	Proposed	Post
Denver	$1.25	$0.75	$1.01
New Orleans	1.10	.63	.91
Chicago	.75	.42	.72
Augusta, Me.	.55	.34	.62
San Francisco	1.50	1.22	1.20

EXPRESS RATES ON HEAVIER PACKAGES.

	50 Pounds		100 Pounds	
	Now	Proposed	Now	Proposed
Denver	$4.00	$2.95	$8.00	$7.50
New Orleans	2.50	2.35	5.00	4.50
Chicago	1.25	1.30	2.50	2.40
Augusta, Me.	1.00	.90	1.50	1.60
San Francisco	6.75	5.30	13.50	10.40

So far as the railways are concerned, the Commission's order, taken in connection with the unsatisfactory arrangement at present in force with regard to parcel post compensation, is likely to make a material difference in their gross earnings. Under the arrangements generally in force between the railroads and the express companies, the former receive half of the gross operating revenues of the express companies for the transportation of express packages. This means that if the reduction in express rates figures out at 25 per cent on the average,

B. D. CALDWELL.
President, Wells Fargo Express Company.

Digitized by Google

W. M. Barrett.
President, Adams Express Company.

the amount received by the roads will be lowered by just that percentage than heretofore for the same volume of business carried. This loss is figured at anywheres from $18,000,000 to $20,000,000 which may or may not be, offset to some extent by increased business due to the inducement of lower rates, although such inducement is likely to be offset by the active competition of the parcel post.

Whether or not the express companies will contest the Commission's order, has not at the present writing, been decided. A series of conferences are being held at which the situation is being studied and the course of action mapped out. The rates become effective on October 15th unless legal action is taken, and the courts decide to order their suspension pending their full investigation.

If the new rates become effective, the loss to the express companies will be tremendous, and various estimates place it at from $26,000,000 to $40,000,000. As Vice-President Francis F. Flagg, of the American Express Company, puts it, "It is not so much a reduction as a slaughtering of rates," and taken in conjunction with the competition of the parcel post has left the express companies in a position where they can hardly be a source of envy to their worst enemies.

THE EASTERN RATE SITUATION

Nothing of importance has developed during the month in connection with the efforts being made by the Eastern carriers to procure an increase of 5 per cent in their freight rates. As the situation now stands, the advances, even if granted, will not go into effect as early as had been hoped. In some quarters it is intimated that the Commission is likely to await the results of the arbitration covering the wage demands of the conductors and trainmen of the Eastern roads. Be that as it may, it now appears that the new schedules which it was originally hoped would be filed in time to make them effective in September, are not now likely to be filed before October 15th, and there even appears an uncertainty in some quarters as to whether all Eastern roads will be ready for such action by that date. On account of the importance of the case, it is evident that the Commission will give it an unusual amount of study and attention, and that a decision may not be looked for much before the beginning of the new year. The task of preparing the new tariffs is a gigantic one, and it is estimated that it will cost approximately $350,000.

Daniel Willard, president of the Baltimore and Ohio and chairman of the Rate Committee of the Presidents of Eastern Railroads, issued a statement during the early part of August to the effect that while it was proposed shortly to file new tariffs with the Interstate Commerce Commission contemplating an increase of approximately five per cent in freight rates, this action would not be taken for the purpose of "forcing early action" on the part of the Commission. He explained that when the Commission recently refused the request of the railroads to reopen the case known as "I. C. C. No. 34000" in order that they "might be given an opportunity to show the reasons, which in their opinion justify the increase," the Commission stated that it would order an investigation of the case on its own initiative, but that two members in a minority report had stated that in order to do this the tariffs in question would have to be filed and be before the Commission as evidence.

"In view of the objections raised by the members of the Commission above referred to," said Mr. Willard, "the railroads concluded to go ahead with the preparation of new tariffs along the lines indicated in their application, and to file such tariffs as soon as they could be prepared, in order that actual tariffs might be before the Commission when the matter comes up for consideration, thus meeting the objections raised in the minority report."

"The filing of the tariffs as now contem-

Digitized by Google

plated does not in any sense indicate friction between the railroads and the Commission, but quite the contrary. It indicates, if anything, a desire on the part of the railroads to comply fully with the expressed wishes of the Commission, and should be so understood by the public. The tariffs to be filed will very likely be suspended by the Commission until an inquiry of the whole question can be conducted."

As the time approaches when this matter is to be given attention by the Commission, the fiscal reports of the more prominent Eastern roads are being scanned with increasing interest. While a number of important systems do not make their reports until later in the year, those thus far published, strikingly illustrate that while gross earnings almost uniformly made new high records, net earnings in the great majority of cases fell below those of last year. Operating expenses, in other words, increased in such a way as not only to consume the entire gain in gross income, but to make serious inroads on net earnings.

To those who have watched railway developments of the past few years, this increase in operating expenses is a logical result of the policy which has been forced upon the railroads, and over which they have had little control. In the first place, expenses have, for some time past, been kept down to the lowest possible point, with the hope that relief of some character would develop by which railway property as a whole, might be cared for in the manner justified by present and future commercial demands. This policy has led to an accumulation of needs which, during the past few months have become so pressing, largely on account of the increased traffic movements, that the carriers have been forced to spend money liberally, even though financial returns, in a majority of cases, did not appear to justify it. Improvement to roadbed and equipment could no longer be delayed, and with many roads it has not been a question as to whether they want to spend this money but simply a question of having to spend it if they want to handle their share of the business. Aside from these necessary expenditures, increases in wages, the higher cost of materials and the additional heavy expense which regulation is constantly thrusting upon the carriers, together with unusually heavy flood damages and costly accidents, have all helped to swell the cost of operation. So far as weaker systems are concerned, these heavy expenditures have been practically in all cases, compulsory, as can be readily seen by the exorbitant rates of interest they have been compelled to pay for money, without which they could not get along. A road that can take out of its gross earnings all the money it needs for betterments, does not go on and borrow cash on the terms on which these roads have been borrowing.

In arriving at a decision the Commission, in our opinion, will be largely influenced by its belief in the necessity for the greater part of the rise in operating expenses as indicated by the 1913 reports. This necessity the carriers should find no difficulty in conclusively proving. In fact they should be able to go much farther, by indicating where much larger sums could have been legitimately and advantageously employed, had a more favorable financial condition warranted their employment.

WESTERN ROADS PROTEST AGAINST RATE REDUCTIONS

While the Western roads, as a whole, have not taken steps looking to a general increase in their freight charges, a vigorous campaign has recently been started against railway rate legislation, particularly as applied to the reductions in both passenger and freight rates forced upon the carriers by recent decisions of the Supreme Court of the United States.

A statement prepared and signed by the presidents of all the more important Western roads declares that the two-cent rate is insufficient compensation for the character of service demanded by modern travel. The roads will appeal to the Interstate Commerce Commission, and to the rate-regulating bodies of the various States. They term the prevailing low tariffs forced on the railroads of the Middle West "confiscatory, unwise, and uncalled for," particularly in the State of Missouri. A united protest will be made against all future reductions.

The statement issued by the representatives of the railroads in part is as follows:

The railroads have promptly obeyed the laws and orders in Missouri, Arkansas, and Minnesota, reducing passenger and freight rates, which were the subject of recent decisions by the Supreme Court of the United States.

The two-cent passenger fare has been put into effect in each State, as well as the reduced freight rates, but the tariffs carrying these rates have been filed under protest. In the cases of a few of the roads the claim that the rates were too low was sustained, and while these roads were permitted to maintain their rates, and will do so where com-

Digitized by Google

petitive conditions may permit, the practical result of the decisions is to affect all lines alike in competitive business, which comprises the greatest part of the traffic involved.

It must not be understood that the Supreme Court has decided any of these rates to be reasonable. The lower courts, after long and patient hearings, decided in each instance that the rates were unreasonably low, and all that the Supreme Court decided upon this branch of the cases is that further proof should have been produced by the railroads.

Railroad men have always believed that the two-cent passenger rate is not enough to pay for the character of passenger service demanded by modern travel, and with the increase in steel equipment, automatic block signals, high speed tracks, new passenger stations, etc., that is constantly required, this is more certainly true now than ever. The freight rate reductions are unjust and unnecessary.

In the East the trunk lines are asking a five per cent increase in freight rates, and there is indication that public opinion favors it. West of Chicago the railroads as a result of these decisions are facing heavy reductions in many important rates, and there never was a time when reductions in rates were more unwise and called for with less reason than the present.

Believing that these reductions are not only wrong but untimely and unnecessary, the railroads have put these low rates into effect under protest and propose to continue their efforts to have them increased. New evidence will be carefully prepared to meet the suggestions contained in the opinions of the Supreme Court in case further litigation should become necessary, and consideration is also being given to an appeal to the State authorities and the Interstate Commerce Commission for relief instead of again resorting to the courts.

PHYSICAL VALUATION

According to estimates made by the Interstate Commerce Commission and presented to the National House of Representatives' Committee on Appropriations, the physical valuation of the railroads of the United States will take from five to seven years by a specially organized corps of men, and will cost the Government from $10,000,000 to $15,000,000, or possibly more. The Commission has asked for an immediate appropriation of $1,500,000 for the organization of the corps of engineers necessary to undertake the work.

Commissioners Clements and Prouty and Secretary George B. McGinty, of the Commission, have told the House appropriations sub-committee that a carefully worked out estimate places the cost of the field work at $1,921,500 a year throughout the period. The plan presented by Mr. McGinty contemplates the division of the country into five districts containing approximately 50,000 miles of railroad each.

Mr. McGinty explained to the committee that the estimated cost per year for each of these district organizations, with their groups or field squads, would be about $384,300, or a total per year for the five districts of nearly two million dollars. In addition to this he estimated that the accounting feature of the work would cost about $350,000 a year, and that the maintenance of a valuation office in Washington would cost probably $150,000 a year.

Although the committee was skeptical Mr. McGinty was confident that the Commission would be able to get the field force organized through the Civil Service Commission by the first of next year, to take care of the first year's work. It was for this purpose, he said, that the Commission needed $1,500,000.

Mr. McGinty mentioned cases where it cost from $3 to $75 a mile to ascertain the value of railroads. He continued:

> In all these cases only the reproduction value of the road was ascertained, whereas we are required to ascertain the reproduction value, the depreciated value and, in addition, to work out the history of the roads and ascertain the amount of money invested in their original construction. The total cost to the Government will probably exceed $50 a mile, or a total cost of from $10,000,000 to $15,000,000, but of course this is only a guess.

As reported in last month's issue, valuations of one or more railroads have already been made in twenty States by local authorities. It is reported that at least eight States are making or planning physical valuations to be used for rate making. These are California, Kansas, Minnesota, Nebraska, Oklahoma, South Dakota, Washington and Wisconsin. Ten States have in recent years made or are making elaborate valuations of all the railroads within their borders. These are California, Kansas, Michigan, Minnesota, Nebraska, New Jersey, Oklahoma, South Dakota, Washington and Wisconsin.

LEGISLATION AFFECTING RAILWAYS

An alarming increase in the activities of State legislative bodies in connection with the passage of railway legislation, is shown in a bulletin just issued by the Special Committee on Relation of Railway Operation to Legislation. It shows that during the legislative sessions of 1913, 1,395 so-called railway bills were introduced, of which 230 were enacted into law. This compares with but 292

Digitized by Google

introduced in 1912, of which but 48 were enacted. Of those which became law in 1913, 48 refer to government of employes and include full crew laws, hours of service laws, etc.; six to arbitration, one to train rules, 33 to equipment, 18 to passenger trains, 8 to freight trains, 6 to cars to be furnished and demurrage, 2 to block and other signals, 3 to clearances, 32 to crossings, 22 to maintenance of way, 33 to stations, 3 to claims, 6 to trespassers, 2 to reports and 7 to miscellaneous.

This widespread interference with railway operations on the part of State legislative bodies, is one of the acute problems which the carriers have to face. Not only is a part of such legislation ill-advised and unnecessary, but it has and is creating an enormous additional expense which operates against the railways carrying out necessary plans for improvement. The ease with which labor organizations have forced their demands through the State bodies, has also had a detrimental effect upon labor efficiency, arousing a sense of false security with its resultant carelessness.

In an article on "The Railway as a Public Servant" in *Leslie's*, Julius Kruttschnitt, chairman of the Executive Committee of the Southern Pacific Company, makes an appeal for fairer and more considerate treatment of the railroad systems of the United States by the lawmakers, commissions and other public officials who have the authority to see that the railways render good service and charge only reasonable rates for it. He indicates the need of more revenue to enable the railroads to maintain and enlarge their equipment and to develop their efficiency up to the standard demanded by the public. He argues that when the railways are doing their best to perform their duty it is contrary to the public interest for them to be subjected to unnecessary restraints and penalties.

JULIUS KRUTTSCHNITT.
Chairman of the Board of the Southern Pacific.

Unlike Congress and State Legislatures which can make their income cover their expenditures because they control both, Mr. Kruttschnitt says the railway managements can control their expenditures only to a certain extent and can get money only by giving freight and passenger service the rates for which are fixed by public authority. Owing to advances in wages, awarded largely by arbitration boards under the Erdman act, operating expenses have increased steadily.

Mr. Kruttschnitt also states that numerous requirements on railways have further increased their expenditures and often actually reduced their efficiency. "In the past few years," he says, "State after State has permitted the Legislatures to decree that additional men shall be employed by the railways in excess of their necessities, whether viewed from the standpoint of economical operation or of public safety. As a result of this millions of dollars have been wasted in hiring useless labor—money which might have been spent to reduce the cost of railway service or improve its quality. The real purpose of this legislation has been to increase the number of men the railways must employ. The Legislatures have in effect robbed the railways and given the spoil to unnecessary employes in order that the members of the Legislatures might get the votes of railway labor."

The laws compelling railways to use special patented headlights on locomotives when headlights of high efficiency, closely approaching the electric headlight in brilliancy and power, were already in use, and the laws limiting hours of service and efficiency of employes, Mr. Kruttschnitt maintains, imposed heavy additional expenses on the railways to satisfy promoters and labor representatives. He says that scores of laws have been passed to increase the outgo regardless of the income of the railways,

Digitized by Google

which are often beset by conflicting laws in the various States which they traverse.

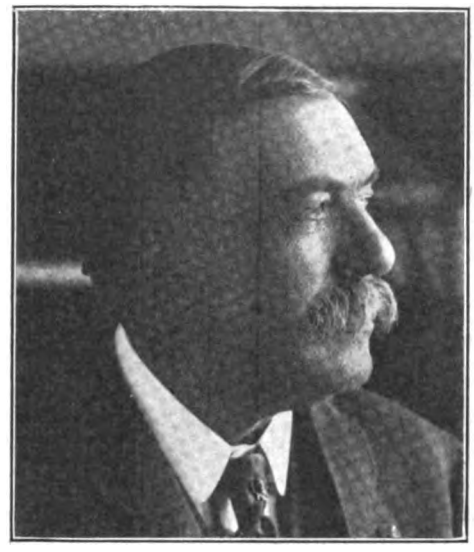
The effect of this unjust treatment, he claims, is strikingly illustrated by the fact that between 1907 and 1911 the railways of the United States put $2,044,417,000 of new capital into their properties on which they have received no return. The return in 1907 on $13,000,000,000 invested, he says, was nearly $9,000,000 more than the return in 1911 on $15,000,000,000 invested capital.

President Ripley, of the Atchison, in discussing car shortages, says present rail rates are not adequate, and that useless laws restrict railroads from raising needed capital.

"If lawmakers would stop their stream of expensive and useless legislation, which is being poured out in such floods upon railroads," said Mr. Ripley, "and see what the effect is of regulation by commissions and courts, there is little doubt in my mind that the railroads would steadily expand their facilities and increase equipment so as to make the widespread car shortage less and less probable. Much of the trouble in the past, and the possibility of danger in the future, lies not in the failure of the railroads to foresee and anticipate the needs of the country, but the inability to raise money to provide the necessary facilities, on account of the destruction of railway credit by hostile legislation."

RAILWAY SAFETY VERSUS PROPER DISCIPLINE

Those who are familiar with the recent trend of railway developments appreciate that in many cases railway labor is not responding to necessary and proper discipline in a way which makes either for efficiency or safety. As elsewhere stated, railway employes, through the successful activities of their organizations, have been lulled into a sense of false security, which is neither beneficial to themselves nor to the industry. This state of affairs, however, is only transitory as the public in the long run will demand as strict an accounting from them as from the executives so far as the safe and efficient operation of the country's transportation system is concerned.



E. P. RIPLEY.
President, Atchison, Topeka and Santa Fe.

Notwithstanding the fact that labor has apparently been decidedly favored in the passage of recent railway legislation, a number of State commissions have shown a certain restiveness concerning reports as to improper or inadequate performance of duty on the part of railroad employes, and on one or two occasions have sharply censured this attitude with demands that steps be taken to correct it. That all State commissions, as well as the Interstate Commerce Commission, will assume a similar attitude come to, can be reasonably expected, and organized labor will have to readjust its standards.

Under present methods of regulation, the railroad employe is fully as much the public servant as the official. Mr. Howard Elliott, the new head of the New Haven System, has pointed this out in an interesting manner in an address delivered some time ago before the Publicity Club of Minneapolis. He said in part:

The railway owner may make rules and regulations and make effort to continue in business, but he cannot always do so unless public opinion in time makes it clear that when a man chooses as his means of livelihood work in a railroad, he assumes a duty to society as a whole to give absolute obedience to rules and to remain at work until suitable arrangements are made to relieve him. So dependent is the welfare of the whole country upon regular transportation that in time public opinion will declare that men in a railroad have no more right to disobey reasonable rules than have the men in the army; have no more right to leave in a body than have the men in the army. When they act thus in the army they are

Digitized by Google

punished for mutiny and desertion. Probably no law could be framed at the present time that would cover these ideas, because it is contrary to our American ideas to say that a man shall or shall not work as he may wish. But public opinion should in time crystallize so that in some way strikes or industrial war would be things of the past, and men could only leave in a body by being mustered out in some orderly manner. We hear much about quasi-public corporations, and public opinion has gone a long way in taking away from the owner of public service corporations the right to manage his own property, to name his own rates or prices, to decide about his methods, and has imposed on him the responsibility of providing safe and adequate public service from his private means, but so far has exerted little influence upon the men who have to make the quasi-public corporation of use to the public. If a man decides to work for a quasi-public corporation he becomes a quasi-public servant and he has a moral duty and responsibility to society just as much as the owner has to see that society is not deprived of the service necessary for its existence.

The railroad manager is hampered in obtaining absolute precision and reliability not alone by the human equation, but by the operation of the force, M. Leroy-Beaulieu points out. Over many of the employes his authority is divided with the labor unions, which exercise a powerful influence in determining the extent of the authority he is to be permitted to exercise over their members. To the unions he must look for acquiescence not alone in the rates of pay and terms of employment, but in the rules he makes, the authority he exercises over men charged with various duties, and the obligations under which a large number of men work. His power to cull his forces and discard not only the unfit, but those who do not demonstrate their entire capability, is limited.

The American people have corrected some of the errors in corporate management and realize that organized capital is necessary to the welfare of the country, but that it must be controlled and regulated.

Organized labor is a great force that makes for good or evil of labor and of society as a whole, depending on the wisdom and patriotism of the leaders.

Most men want to work and support their families, but they fear the ridicule of their fellows and sometimes follow too blindly an unwise leader who may do them a real harm.

Public opinion at one time justified burning and torturing people because they did not follow the same religious practices as those in authority. In old Salem, it justified burning women who were thought to be witches. Less than 100 years ago it justified one man killing another in a duel because of some insult, real or fancied.

To-day physical violence and social ostracism are still in practice toward those who do not wish to join a labor organization, but who do wish to work. But public opinion will change and say to organized labor, as it has said to organized capital: "You must be fair to all." J. B. McNamara in his confession said: "I did what I did for principle." It is only necessary for an aroused public opinion to speak out and show the unfortunate men like the McNamaras that the many good men in the ranks of labor and the many good men in the other walks of life will not stand for that kind of principle.

THE 1913 FLOOD

Much has been written since March regarding the devastating floods which visited the Middle Western section of the country during that month. It remained for the Pennsylvania Railroad Company, however, to prepare the first complete and comprehensive statement, in the form of an illustrated booklet, regarding the damage done to its system and the tremendous efforts which were made to quickly repair and rebuild roadbed and bridges, which, in many cases, were literally swept away. The accompanying maps graphically illustrate the complete manner in which this system, west of Pittsburgh, was put out of commission.

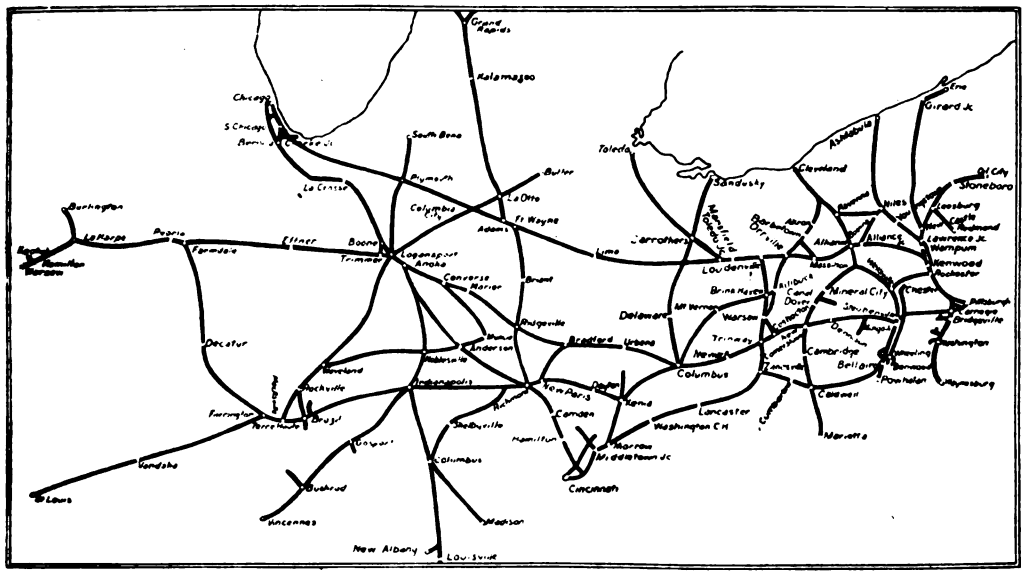
Not only were these lines a wreck in the sense that every division was effected, but all other roads in Ohio were in equally bad shape. There was the Erie Railroad with its double track of main line; the Baltimore and Ohio, likewise; the Wabash, with its single track, and the Pittsburgh and Lake Erie with all its branches more or less damaged.

So far as the Pennsylvania was concerned, its lines all through Ohio, running from east to west and from north to south, were literally shot to pieces. Bridges were gone; tracks and embankments swept away, holes in a thousand places, and no through line anywhere. In addition to this, the labor condition could not have been worse, and as every city needed every available man for its own work, the Pennsylvania had to depend upon itself. As a result there were no eight-hour days, no coming home in the evening and no meals with the family. The company did, however, endeavor to show at least some of its appreciation of the loyalty of the men when its masons and carpenter gangs and shopmen engaged on damaged portions of road had more than twenty-four hours, were paid one and one quarter time for all hours worked, including the time consumed en route between headquarters and their work. Extras were also paid to individuals called on or volunteering for unusually hazardous work. Bonuses were paid to all classes of labor in varying amounts, reaching down to the track laborers. The pay checks for these services bore the sentence, "As a token of appreciation of the spirit of co-operation shown during the recent flood." These bonuses and extra allowances amounted to more than $70,000.

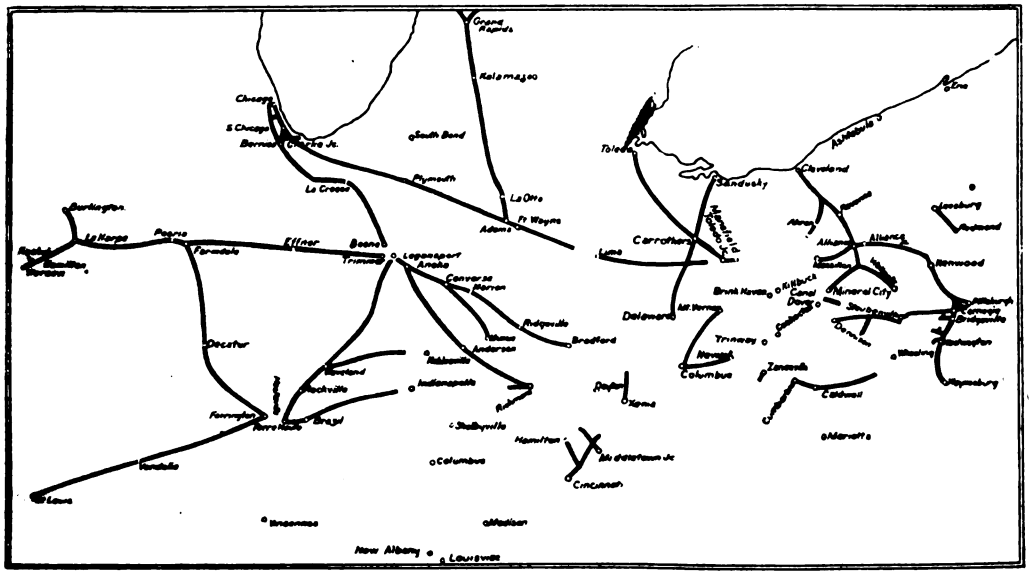
Notwithstanding the gigantic operating

Digitized by Google

Lines Before the Flood



After the Flood Came



THE BREAKS SHOW WHERE THE TRACK WAS OUT OF COMMISSION.—THE IMPOSSIBILITY OF THROUGH TRAIN SERVICE IS OBVIOUS.

problems to be solved, the patriotic stand taken by the Pennsylvania Railroad is indicated by the following message carried in person by the division superintendents to Governor Cox, of Ohio, and Governor Ralston, of Indiana, which was: "Whatever railroads we have left, crippled though they are, are at your disposal; use them." The railroad officers were in hourly communication with Government officials of the States effected. Cars and trains were hauled, troops and supplies were moved, and for any relief or Government work, there was no suggestion of a pecuniary return. The predominant idea was to allay human suffering and to save human life.

Digitized by Google

The report refers to the way in which the campaign against the flood was organized, in the following manner:

As early as Tuesday night the Board of Strategy was in session in Pittsburgh. From that time until Sunday, April 5th, it was in continuous session day and night. The "Board of Strategy" was made up of the higher general officers of the road and their assistants, with their consulting staff of engineers, motive power and transportation men.

Everything was done in the name of the General Manager. What was going on in the sixteen divisions of the road was reported to this Board, and it was thus in absolute control of and in touch with the situation. Its information was made possible by the work of the Superintendent of Telegraph, who had moved his offices next to that of the Board of Strategy, and was there carrying on his campaign of wire restoration. For the first thirty-six hours every one was on duty; after that they averaged eighteen hours a day individually.

The three general superintendents of the three systems—the Northwest, the Central and the Southwest—established headquarters where they could be in touch with their own divisions and with headquarters at Pittsburgh.

The task to be accomplished was gigantic but the splendid organization responded nobly and in almost a miraculously short time sufficient repairs had been accomplished to permit the resumption of traffic almost upon a normal basis.

To go into detail of the Pennsylvania losses would hardly furnish an adequate idea of the losses as a whole, but it may be interesting to give a few details, only suggesting that the problem met would not have been a simple one had the damage been concentrated instead of being widely scattered, and consequently very difficult to get at efficiently.

Number of bridges lost	24
Number of bridges damaged	50
Number of spans lost	39
Number of spans damaged	48
Bridges lost—Length in feet of road	3597
Bridges lost—Length in feet of single track	4318
Bridges damaged—Length in feet of road	4189
Bridges damaged—Length in feet of single track	6239

The estimated cost of replacing these bridges is $1,027,116.

Length of trestle built for single track, in miles	1.94
Length of trestle built for double track, in miles	0.96
Length of trestle built for three tracks, in miles	0.02
Length of trestle built—Miles of road	2.92
Length of trestle built equivalent to miles single track	3.92

The estimated cost of these trestles is $336,144.

Length of single track road requiring repairs, in miles	88.7
Length of double track road requiring repairs, in miles	41.1
Length of three-track road requiring repairs, in miles	2.5
Length of four-track road requiring repairs, in miles	2.8
Length of road requiring repairs, in miles	135.1
Length of road requiring repairs, equivalent to miles single track	189.6

The estimated cost of these repairs to the road is $1,396,290.

In addition to the above, damage to stations and other buildings was $70,900; to equipment, $84,285; and to telegraph lines, $107,505.

The direct property loss to the Pennsylvania is estimated at $3,600,000 in round numbers, and it provides the most pertinent of arguments for allowing the railroads to so fix their rates as to provide for a surplus. The cost of repairment, under the ruling of the Interstate Commerce Commission, must be charged to operating expenses. So heavily have low compulsory rates weighed upon many of the public utilities companies that the damage done by the flood has wiped out the surplus of many of them and they are now in the hands of receivers. Others have been very badly crippled.

Samuel Rea, president of the Pennsylvania System, made the following comment on the flood and on the way the disaster was met by the regular organization of the company:

The officers and the employes of the Pennsylvania Lines west of Pittsburgh have done remarkably efficient work in restoring their lines to service. Immediately the seriousness of the storm damage was known, the company placed all its facilities at the command of the State authorities of Ohio and Indiana for the relief of the afflicted area.

Simultaneously most energetic efforts were instituted to repair the various lines and re-open them without delay to the service of the public. That this work has been done so promptly, so carefully, and with such freedom from casualty reflects every credit upon the officers and employes faced with responsibility for meeting this extraordinary emergency.

No event in the history of railroading in this country has shown more convincingly the necessity for the railroads to be permitted to earn sufficient revenue not only to make reasonable return on invested capital, but also to have a surplus sufficient to meet emergency expenditures like these and to improve the properties in those respects which, even if not adding to gross revenue, make the lines better adapted to withstand the ravages of storm and flood and the better able to perform their duties to the public with efficiency and satisfaction.

INSUFFICIENT RAILWAY INCOME

The Railway Business Association has recently prepared and published a bulletin entitled "Railway Income Still Under 1910," which declares that action as to freight rate advances "should be based upon the known

Digitized by Google

past and not upon the half revealed present." In other words, it points out that the latest statistics deducting fixed charges are those for the year 1912 and indicate net corporate income 15 per cent under 1910. For this reason, month reports of operating income for 1913 will signify nothing as to net cororate income until the fixed charges yet to be reported shall have been deducted. The Bulletin presents figures to show that in the years since 1910 for which statistics are complete—1911 and 1912—net corporate income was 20 per cent and 15 per cent respectively under 1910. For eleven months of the fiscal year preliminary returns covering revenue, expenses and taxes are analyzed and by estimating fixed charges and other non-operating deductions it is shown that there is no reason to count upon net corporate income even in 1913 as large as it was in 1910 available for improvements and dividends. Fixed charges holding to past averages, income for eleven months in 1913 would be $11,689,312 under the same period three years earlier, "and this with a plant in 1913 estimated to have 33,901 more miles of track than the plant of 1910, 293,331,501 more pounds of locomotive tractive power and 14,175,970 more tons of freight car capacity, and to have carried 7,900 million more tons of freight one mile."

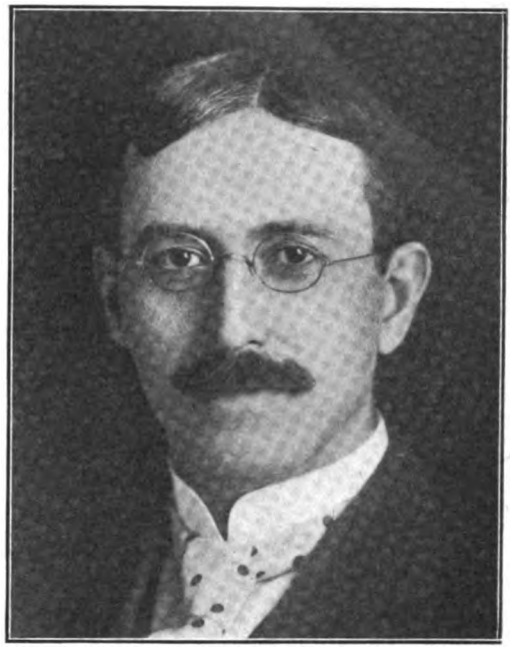
Recalling that steam railroads in 1912 had the smallest listings of new securities in ten years and non-railroad corporations the largest, it is remarked that "the practical condition of declining credit is not disputed."

Resolutions have been adopted by prominent business organizations in St. Louis, Cincinnati, Pittsburgh, Philadelphia, Baltimore and other large cities favoring or deciding not to oppose higher freight rates whereunder the Eastern roads may provide better service. President George A. Post says:

> Commercial organizations, local, State and National, can promote national prosperity by making known, as some leading bodies already have done, their conviction of the need for more railway facilities and their willingness to pay what is legitimately necessary to get them.

E. C. Simmons, of St. Louis, is quoted as saying:

> Thousands of shippers have come to realize that their business is prosperous only when the railroads are prosperous and any slight increase in freight rates which they might have to pay would soon be lost sight of in the enormous increase in the profits of their business which this general prosperity would bring about.



FRANK NOXON.
Secretary of the Railway Business Association.

The Bulletin adds:

> Hardly any national calamity can be more exasperating than industrial prostration descending in the midst of busy times, with order books full and mills running to capacity—prostration brought about by congestion of terminals, throwing into idleness, with their employes, factories which could neither obtain raw material nor deliver finished product, while foodstuffs lay rotting in cars and elevators.
>
> The public had better be safe than sorry—assured of good service rather than in danger of a transportation breakdown.

A second article, "Making Equipment Carry All It Can," tells "what the shippers and the railroads are doing to minimize the necessity for more facilities," but "they can not do enough."

With a net car surplus on August 1, 1913, of 58,455 and a decrease from that date to autumn low supply equal to the annual average decrease from August 1, 1908-12, or 150,400, the autumn net shortage in 1913 would be 91,945, as compared with 87,000, the previous record, that of 1907. The shortage thus indicated would be aggravated by a severe winter possible into a great national congestion.

As forecasting a good sized fall tonnage, cereal crops are estimated at about the ten-year average, with cotton 39.1 per cent

Digitized by Google

above; while iron production for the first six months of 1913 was 1½ million tons above previous high record, expenditure for construction of new buildings outside New York City in excess of previous record, exports 6 per cent over 1912 and for seven months of 1913 bank clearings outside New York City 3.9 per cent greater than for the same period in 1912. In this situation Chairman Clark, of the Interstate Commerce Commission, and President Kruttschnitt, of the American Railway Association, in letters, as well as the National Industrial Traffic League in a resolution "unite in calling upon all concerned to do their utmost with a transportation plant inadequate for peak of load."

HOWARD ELLIOTT'S ADDRESS TO NEW HAVEN STOCKHOLDERS

Howard Elliott, who became president of the New Haven System on September 1st, attended his first meeting of New Haven shareholders on the preceding Friday. He delivered a short address in which he called the shareholders' attention to the fact that they had a duty to perform in protecting the interests of the company and exerting an influence which would prove helpful to the management. He pointed out that railway directors and officials of late years have been sorely beset trying to do their duty to the owners and to the public. Continuing, he said:

"We have had to meet great rate reductions, increased cost of labor, increased cost of material and demands for better facilities. All of these have created a problem that is most difficult to solve because there are only 100 cents in a railroad dollar just the same as in any other dollar.

"But it will be my aim to try to see that every dollar received into this company's treasury, whether from earnings for service performed, or from advances by stockholders or from loans from others, is expended with the greatest care and prudence and that the railroad will be managed solely with the idea of economy, efficiency and safety so as to safeguard your interests not only now but in future because the railroad has got to go on forever and if it should happen that, in trying to protect your interests, there is some disturbance for the present, that is something to be patient about.

"The stockholders can do a great deal of good, each one in his own circle, in trying to present the railroad side to legislatures, to members of Congress and commissions and to all who make the different laws under which the railroad is trying to operate; the stockholders can do good by pointing out that there are two sides to this question, and that the side of the stockholders must not be lost from view in considering the question and in making demands upon the railroad that the officers and directors are most anxious to meet, if they can. They are torn between trying to protect the stockholders and trying to give the public what they need and should have; but you can do much good by using your influence, each one of you, to point out both sides of this question."

A statement has been issued by the management of the New Haven to the effect that while Charles S. Mellen, the retired president, will have no official connection with the system after the end of August, he has agreed to place at the disposal of the president and the directors, such information as he has acquired from his long connection with the property, and has also agreed to give advice from time to time as requested. In other words, he will act in an advisory capacity when requested to do so.

In discussing the probable attitude of the Government towards the New Haven under its new management, the Springfield *Republican* states that "if Attorney General McReynolds has been persuaded to give the new management of the New Haven Railroad system 'a chance,' before instituting a suit against the company under the anti-trust law, the public must infer that the company intends to reorganize in a way to makes such a suit futile and profitless."

While the Attorney General has issued a statement in which he says: "There has been no direction to suspend the investigation," it is felt that he desires every opportunity given the new management to develop some plan of procedure which will make a suit unnecessary.

PANAMA CANAL DEVELOPMENTS

Latest reports from the Canal Zone announce that, as the result of the prospective substitution of dredges for steam shovels in the excavation of the famous Culebra Cut, the canal may be ready for shipping by next December. Even earlier than that light draught vessels are likely to be passing through the waterway.

Contemporary Opinion

President Elliott's Task.

IN accepting the position of chief executive of the New Haven System, Mr. Elliott has undoubtedly undertaken the most difficult task of his career, and it is hoped that the people of New England will appreciate this, and lend his efforts their moral support. Speaking of the difficulties which Mr. Elliott will have to face, the New York *Times* remarks editorially:

"The problem before him is how to sustain the earning power of the New Haven System in competition with the trolleys and the water carriers when divorced from them. The rates cannot be raised, both because of regulation and because of traffic conditions. Everything into and out of New England takes a longer haul than to ports which are less easterly, and the facts of geography cannot be altered. Fuel is higher than for its competitors, and switching charges are costlier because entire New England is practically a terminal for a large section of the United States. Volume of traffic is a necessity, and yet it can be filched away by rivals with many advantages.

"It is sure that he will have to meet competition which Mr. Mellen controlled. He also will have to allay irritations which arose from the manner in which Mr. Mellen met criticism which seemed to him as unintelligent as unsympathetic. He met railway problems in the railway manner of his time. Mr. Elliott must confront the same problems in another manner, which as yet is theoretical. If he succeeds he will do more than fortify the future of the New Haven System. He will found a new school of railroading and establish theories now contentious. He must think he sees his way clear, or he would not attempt it. No one can wish that he should not succeed, and no one should oppose him in the manner which gave him his opportunity. It is possible to suppose that the dividends of the New Haven System may be more secure than under the open-handed methods of Mr. Mellen, but it remains to be seen whether this will be more to the benefit of the users of the New Haven's facilities now to be restricted. Rest and recuperation are to be the watchwords, rather than expansion. The country needs it as much as the New Haven, and will be correspondingly observant of results."

Railroad Discipline.

THE recent disastrous wreck on the New Haven has caused newspapers to break out afresh against railroad management and operation in general. It is about time, however, for a more general recognition of the fact that a great majority of recent railroad accidents have been directly traceable to the carelessness of railroad employes, rather than to any inherent weakness in the company's equipment or method of operation. These half baked criticisms, while hurling maledictions upon the heads of railroad officials, fail to place the blame where it really belongs, and are, in themselves, a contributory factor in encouraging disorganization and inviting a continuance of lack of respect for proper discipline.

In a recent editorial, the New York *Commercial* remarks that:

"Lack of discipline in the operating departments of American railroads is the cause of a large part of the accidents about which so much is heard. It also has a serious effect upon the costs of operation and the earnings of railroads about which the public knows nothing. The labor unions have become so strong that they are able to interfere with the promotion of locomotive engineers and other workmen for efficiency in service. The men know that extra efficiency and care is not rewarded as it should be, because the labor unions do not allow them to take what is their due in the way of extra pay or better terms of service, the excuse being that this would lead to unjust discrimination between employes of the same class."

The editorial then proceeds to show how the labor unions are constantly attempting to interfere with the necessary discipline of the men, and that such interference strikes at the very foundation of safety in railway operations. If, for example, to quote the editorial "a railroad official cannot order another locomotive driver to take out an engine when he fears that the man whose name is at the head of the list is unfit to drive the engine, there is no way to protect the public from disaster. The captain of a ship would certainly take a man away from the wheel and put another in his place at a moment's notice, if he thought there was anything wrong with the man's condition. It is not always easy to determine exactly what is wrong with a man, and it is often very hard to prove that anything is wrong. The foreman or inspector of a railroad should be able to act promptly on his intuition if he has no more definite cause for telling a man that he is unfit for his task. A locomotive driver may be perfectly sober, and yet be in a nervous condition, perhaps through loss of sleep, caused by sickness of some member of his family. The man is not to blame for this, and certainly would not be censured by his superiors, but the lives of travelers should not be endangered simply to give him the run for which he was slated. Only by conferring authority upon officials can discipline be maintained."

The Effort to Eliminate Accidents.

(From the *Iron Trade Review*.)

GREAT corporations are emphasizing the fact that safety is the first consideration in the conduct of operations. If indifference was formerly displayed on this subject, there is now an acute awakening. The personal injury question is regarded as an inseparable part of overhead and liability for it is not evaded. The movement for safety first is not confined to the United States, but is world-wide. The Board of Trade returns of accidents and casualties on the railways of the United Kingdom is just at hand. The number of passengers killed during 1912 was one in 68,100,000 transported, while the injured was one in 1,895,000 transported. Small as this ratio is, it is larger than that of previous years. The casualties to employes show an increase of about 200 over the previous year. One locomotive driver in 13,665 and one fireman in 12,700 were killed. Many of the accidents were preventable, that is

Digitized by Google

to say, were due to lack of caution on the part of employes themselves. The figures prove, however, that railroading is a reasonably safe calling if the men are alert and act with ordinary intelligence.

In the United States the campaign for safety is carried on even to a greater extent than in the United Kingdom. Railroad workers are organized down to the commonest laborer through committees to seek some means of preventing accidents. The end sought is to eliminate altogether the avoidable accident. The avoidable accident is almost invariably one for which the employe himself is to blame.

All of the great steel plants in the United States have the dangerous places marked with red discs and on the vessels plying in the ore trade on the Great Lakes all the places of possible danger are conspicuously indicated.

It is clear that the management is doing all it can to minimize accidents. Their elimination depends upon the alertness and intelligence of the men.

Railroad Valuation.

ROBERT E. IRETON in the *Magazine of Wall Street* for August, discusses in an interesting manner railroad valuation, and shows by examples of valuation thus far attempted, how vastly different are the results obtained by those who have undertaken such work. He shows how the Minnesota Railroad Commission's valuation figures for that State were pronounced too low by the courts; how the Texas Railroad Commission's figures of $212,000,000 compared with the Texas Tax Commission's figures of $419,000,000; how the Wisconsin Tax Commission's figures of $34,630 a mile compared with the capitalization of the roads of $33,420 a mile. He also points to the fact that Professor Swayne, of Harvard, valued the New Haven System a few years ago for a special Massachusetts Commission at $600,000,000, the book value of the road at that time being but $425,000,000. Considering the railroads of the country as a whole, he shows that the Census Bureau estimated the value of railroads operating in 1904 at $11,244,852,000, while the report of the Interstate Commerce Commission for that year shows the value of railroad stock and bonds to have been but $9,585,467,711. In closing his article, he says:

"The theory that the railroad valuation of property is established by the cost of the replacement of a railroad's physical possessions is absolutely illogical. Thereunder no allowance would be made for that fluctuation in values which is constant, and which generally favors the roads. Nor would allowance be made for the 'use' of the property—the element or factor which gives the railroad life and existence; nor for the 'brains' or efficiency of its management, which is ever an asset of any going concern. And, finally, but preeminently, the replacement theory gives no consideration to the earning power of the road—the real factor which gives it value.

"While there was much over-capitalization of railroads in this country prior to 1880, that is not the case to-day. Through reorganization and application of net income to betterments, refunding of high interest bearing bonds, increased trackage and equipment, valuation of property and greatly improved service, our railroads are worth more to-day than the sum total of their stocks and bonds, and could not be reproduced for anything like that aggregate. Railroad over-capitalization, except in rare cases, is largely a figment of the imagination."

Sterilized Capital.

(*Saturday Evening Post.*)

STOCKS and bonds in America and Europe have suffered an enormous decline in price the last six months. You read about it and say: "That means nothing more than a different set of quotations; the actual wealth the securities represent is as great as it was before." But that is not necessarily so. The moment capital's power to reproduce itself—which is tantamount to its earning power—is crippled, the capital itself begins to perish. With some exaggeration John Stuart Mill wrote: "The greater part of the wealth now existing in England has been produced by human hands within the last twelve months. A very small proportion of the large aggregate which is now in existence existed ten years ago. The land subsists, and the land is almost the only thing that subsists. Everything which is produced perishes, and most things perish very quickly Capital is kept in existence from age to age not by preservation, but by perpetual reproduction."

If you turn to the schedule of national wealth issued by the Census Bureau you will see how nearly true this is. There is land and gold and silver. Everything else is a product of very recent years and is passing away even while the enumerator is writing it down—live stock, agricultural products, manufactured products, mining products, merchandise, tools, machinery, railroads, which are constantly wearing out and being renewed. Scarcely a physical particle of the railroad that was in existence twenty years ago exists now. It must reproduce itself year by year. So must practically all capital except land. We rebuild almost our whole transportation and manufacturing plant every twelve or fifteen years. To destroy capital nothing is necessary except to cut off its power of reproduction, or earning capacity—a fact to be kept in mind, for example, in considering railroad rates.

Decreasing Railway Net.

"AN obvious fact noted in connection with railway earnings," says Bradstreets, "is the ascending tendency of operating expenses. This is not a new development; but inasmuch as it continues to advance, it is plain that operating officers of railways, speaking of them collectively, have burdens that are analogous to those of the ultimate consumer, so called. An example in this respect is furnished by the returns for the month of June. These show that gross receipts went up 7 per cent on a total of $237,937,321, over those for June, 1912, while at the same time expenses increased 10.6 per cent, thus more than absorbing the gain in gross earnings and leaving a decrease of 1.6 per cent in net revenue. Stated in another way, gross earnings increased $15,674,105 and operating expenses $17,779,923, while net receipts fell $1,105,818. In June, 1912, gross earnings moved up 7 per cent, while net revenue advanced 6.1 per cent. These ratios would be quite favorable were it not that both items fell 2.4 per cent and 4.9 per cent in

Digitized by Google

June of 1911. On the basis of comparisons, the showing for this year is not calculated to spread much encouragement, particularly when it is considered that capital expenditures to keep up with the growth of the country have increased, and that more funds are required to pay stockholders for having made investments. Because of the facts it is not astonishing that some of the roads are appealing for higher freight rates.

This table presents the statistics in short compass:

	June, 1913.	June, 1912.	Inc. p. ct.
Gross earnings	$237,937,321	$222,263,216	7.0
Operating exp.	173,643,845	156,863,922	10.6
Net earnings	$64,293,476	$65,399,294	*1.6

*Decrease.

Too Much Legislation.

(From *Financial America.*)

GOVERNOR O'NEAL, of Alabama, did not exaggerate in his address before the House of Governors the other day, when he said that in many, if not a majority, of the States a session of the legislature is looked upon as something in the nature of an unavoidable public calamity. In recent years this is altogether too true, and the worst of it is that the public point of view does not seem to affect very much either the character of our annual enactments or to limit their output.

In many States corporations have been driven out. In others the drastic enactments prevent capital from entering. As a resultant in these States progress is halted, development is checked, and prosperity is endangered. Commerce is restrained therein and that is bad and injurious for any community. What is still worse, the business interests that are not affected by the visitations and activities of the demagogic statesmen, pursue the tenor of their way practically in fear and trembling. They know not how soon the sword may be drawn against them, and even the least observing among our citizens can perceive that the result is restraining and retarding to healthy progress, to sane and sound business development.

In the last year or two the Governors of certain States, in order to cope with this situation, have set their faces steadily against the enactment of drastic anti-corporate legislation. They have even gone so far as to mention it in their inaugural addresses, to advise against it, and to point out its crippling consequences. Capital, however, is the most timid element dealt in. It takes fright quickly and withdraws speedily to places of safety. Once affrighted it is exceedingly hesitant about returning to the scene of its apprehension. This is now being experienced in certain Western States, and the result does not augur well for their immediate development.

Railway Pay for Parcel Post.

(From *Philadelphia Record.*)

AN unprejudiced consideration of the question addressed to the Postmaster General by seventeen Western railroads can scarcely lead to any other conclusion than that fair dealing requires a readjustment of railway mail pay in connection with the introduction and extension of the parcel post service. The estimate is conservative that the Government collected $11,266,800 in increased revenue from the parcel post service during the first six months of its existence. And for the additional transportation service represented by this increased volume of postal business the railroads received no compensation whatever. The parcel post act authorizes an increase of 5 per cent in the gross mail pay, beginning with July 1. This would amount to about $7,500,000 per annum; and, if the weight limit and rates of the parcel post had remained as established in the Act of Congress, this might have been fairly remunerative.

The new regulation, however, will bring to the Postoffice a quantity of parcel post matter which if carried by the express companies would have produced over $40,000,000 in annual revenue. Under existing express company contracts with the railroads the latter would have received about one half of this revenue for transportation. The probability that the railroads will lose $20,000,000 of income through the parcel post extension is, therefore, evident. But the Postmaster General probably cannot give the relief desired. Railway mail pay is governed by Acts of Congress. Nor would the easy method of increasing by 10 per cent or thereabouts the gross amount payable to the railroads for mail transportation be the most equitable way of redressing the situation.

Railway Scrap.

(From *Harper's Weekly.*)

THE wreckage of hundreds of thousands of tons of steel and iron that was piled up after fire and earthquake had devastated San Francisco, was called the biggest scrap heap in the world. Yet it shrinks into insignificance in comparison with the amount of scrap material that the railroads of America accumulate every year.

The scrap heaps of the railroads grow larger and larger every year, owing to the steady expansion of business. They are composed of used-up locomotives, machinery and material of every sort and description. Even at the small prices per ton or per pound at which this metal waste is sold it brings in millions of dollars every year.

Of all the vast amount of material that a railroad purchases every twelvemonth, 90 per cent eventually finds its way into the scrap heap. In no other business are the odds and ends that are no longer serviceable collected with so much care. Everything from the frames of tin lanterns to the ponderous driving wheels of locomotives reaches the scrap dock in the end.

But before anything is "scrapped" it has to be passed upon by about a dozen experts. They look it over and see if there is a possibility of its being used in any other way before it is sold to the junk man. On one of the Eastern railway systems, a few years ago, a large quantity of steel freight car bolsters were found to be unaivailable for the type of car for which they were originally intended. One by one the mechanical experts shook their heads and voted that they be sent to the scrap dock. But one of the examiners suggested drilling an extra hole in the condemned bolsters and using them on a different class of

Digitized by Google

truck than that for which they were intended. This was done at little cost, and their journey to the junk pile was delayed.

After the material gets to the scrap dock another set of experts goes over it. There was a time when the junk dealers knew more about the value of scrap metal than the railroad men. The dealers bought craftily and at low prices, because the scrap was sorted into only a few classes when it was offered for sale. After buying the material the dealers resorted and made big profits. Many of them grew very rich.

Nowadays the Railway Storekeepers' Association is as wise as to the value of the scrap as the dealers. The members of the Association have been studying it year after year and discussing it at their annual meetings. At present scrap is classified into more than a hundred different grades and varieties. Each has its market price. There is no longer a chance for speculation or guessing. The railways are getting more for their waste material to-day than ever before. The average is between $15 and $16 a ton.

When the car scrap is picked up and loaded on the cars it is only roughly sorted. Its final sorting and classification occurs when it reaches the scrap docks. The manual labor of unloading and handling this material used to be a very heavy item of expense. Now big electro-magnets attached to movable cranes save much time and money. One of these cranes will do the work of fifty men.

The Detail of Railroad Ties.

(From the *Wall Street Journal.*)

SO much stress is laid upon the importance of the rail in the creation and upkeep of railroads that the more modest but indispensable tie is little thought of unless grave accident calls attention to its fundamental position in construction. Ties represent perhaps the largest return, in proportion to investment, of any part of the equipment of a railroad. Cheap in themselves, their aggregate cost is great. Some idea of this is given by figures showing what ties really mean in the bills of the railroads. Minimum renewals per annum, varying all the way from the high maintenance of the standard roads to the perfecting of poor trackage, represent at the least 75,000,000 ties. The 750,000,000 railroad ties now in use have an initial value of $300,000,000.

Problems presented by the question of ties are awakening expert attention. The time is not far distant when lumber supply will cease to offer enough material for ties in addition to increasing demands from many other industries. Tie substitutes are being sought. Steel has not yet given satisfactory results. Opinion leans to concrete ties. Without allowing for any growth of our railroads, the cost of replacement of wooden ties on the railroad tracks of the country would mean a sum of more than $1,500,000,000. This takes inadequate account of the developments of the future. Nor does it reckon with the electric and trolley systems which are slowly, or rapidly, starting to equal in extent the 250,000 miles of railroad track in the United States.

There is another consideration in the tie question. Between 60,000,000 and 75,000,000 ties are burned each year, the railroads having found it practically impossible for various reasons to sell or to give away the discarded ties. This destruction represents from 2,000,000 cords of wood, whose value is from $7,000,000 to $8,000,000. It would seem that this might be saved "and given to the poor." But the poor will not take it, as attempted distribution has shown.

There is disinfectant and medicinal quality in the creosoted wooden ties. Perhaps some of our philanthropists can find a use for the old ones, particularly in connection with tuberculosis complaints. They are worthy a better use than that of the tramp's cooking camp.

Satisfy Yourself.

WILLIAM JOHNSTON in the "American Magazine," lays down the following rules for personal conduct, which if applied to railway service, would solve many of its daily problems:

"It is not what people say about you—it's what you are that counts. The one person in all this world whom you should aim to satisfy is yourself. You alone know yourself. Other people know your outward appearance, your actions, your deeds. You, and you alone, know your motives, your ambitions, your thoughts.

"Are you satisfied with yourself? It is your own fault if you are not. Are you satisfied that you are doing the best you can in your work, that you are making the most of your time? Are you confident that your conduct toward your family, your friends, your neighbors, your employer, can not be improved?

"Look yourself straight in the face this morning, in your mind's looking-glass. Ask yourself whether it is what people say about you or what you are that hurts. Analyze your own conduct in all matters.

"Put yourself in the other fellow's place and try to see your actions through his eyes. Imagine that you are your employer instead of yourself. Answer honestly whether, if he knew as much about yourself, he would discharge you or would raise your wages. If you do this conscientiously there are many things you will do differently.

"Remember this, too. Other people's opinion of you is based on your own opinion of yourself. Are you self-respecting? Other people will respect you. Are you truthful? The world will believe you. Are you honest? Everyone will trust you.

"But weigh yourself frequently. Weigh yourself carefully. Be certain that your own opinion of yourself is justified. Be satisfied with yourself."

Mr. Barber on Government Ownership of Railways; A Rejoinder

By H. T. NEWCOMB,
OF THE WASHINGTON, D. C. BAR.

THE OUTLOOK, for July 19, 1913, contains an article written by Mr. O. C. Barber, proclaimed as the organizer of the "Match Trust," in which the author declares, in his first sentence, that—

> "Extravagance is the paramount American characteristic, not only individually but nationally,"

and proceeds to demonstrate, in nearly every succeeding sentence, that there is an extravagance of words as recognizable and as alluring to its victims as any extravagance of deeds. The latest annual report of the Statistician to the Interstate Commerce Commission gives the average capitalization per mile of American railways as $62,657 which, on the basis of 250,000 miles would show a total of $15,664,250,000; Mr. Barber states this aggregate, on page 616, as "nineteen billion dollars," and, again, on page 618, as "twenty billions." On page 617, Mr. Barber says—

> "* * * * during the last ten years the railways have * * * * paid nearly three billion dollars in dividends and had left nearly four billions of surplus."

The reports of the Interstate Commerce Commission show that in ten years, from 1901 to 1910, inclusive, the sum paid in dividends was $2,083,318,300 instead of "nearly three billion dollars" and that the entire accumulated surplus on hand on June 30, 1910, that is, not the surplus of the ten year period but that of all the years of operation, was $1,371,107,759 instead of "nearly four billions."

Such errors as these do not, however, constitute the justification for the present rejoinder. The task has been assumed in order to state a few of the funadmental considerations involved in the replacement of private by public railway ownership and management, so enthusiastically advocated by Mr. Barber. A careful winnowing of Mr. Barber's paper reveals the following which he regards as arguments for such a change. He favors Government railway ownership and management—

1. Because he conceives that railways are overcapitalized,
2. Because he thinks transportation costs could be reduced,
3. Because he believes there would be fewer accidents, and,
4. Because he is confident there would be no strikes.

ALLEGED OVERCAPITALIZATION.

It is difficult to understand the persistence of the erroneous belief that a railway can increase its receipts by increasing its liabilities. Capital securities, either shares or bonds, are liabilities

H. T. NEWCOMB.

and it is true that bonds call for regular interest payments. Hence, it is inconvenient for any railway to have a burden of improvidently incurred indebtedness, just as such indebtedness is burdensome to an individual. Take an example in the concrete. Most railway managers must envy the management of the Delaware, Lackawanna and Western, which is substantially without bonded debt and although capitalized at less than $43,000,000 could undoubtedly obtain three times that sum on very favorable terms should its shareholders choose to authorize the use of its high credit for purposes of improvement or expansion. But there is another aspect of even this situation. It is certainly questionable whether the general railway situation of the United States is better because the Lackawanna has hoarded its credit instead of conservatively utilizing it in providing for still higher efficiency and a more extended field of utility. Solvency is an economic asset which may be made to perform service—is it always well that it should, like the buried talent, remain sterile and unproductive?

Turning, however, to the opposite extreme, the improvident issue of promises to pay principal and interest, no one believes that John Smith can increase his wages as an artisan, by foolishly straining his credit with his grocer, or that any landlord can increase his rents by mortgaging the leased premises. Why then, should even an excessive issue of railway bonds be considered a certain or even possible claim to increased rail-

Digitized by Google

way rates? And, if it is not effective in enforcing such a claim, what interest can the traveling or shipping public, as distinct from the investing public, have in the matter. The facts are not difficult to discover. Whoever listens to the assertion that railway rates are affected by capitalization would do well to compare the facts concerning the Delaware, Lackawanna and Western and the Erie railways. The latest available report of the Statistician to the Interstate Commerce Commission states the total par value of the shares and bonds of the former as $30,597,000* and of the latter as $402,269,047. Per mile of line, the averages shown by the report are, for the Lackawanna, $128,214, and for the Erie, $259,897. But, during the year covered by the report, the Lackawanna paid out in dividends and interest the sum of $23,117,545 while the Erie paid no dividends and its interest payments aggregated $10,129,212. Thus with an aggregate par value of shares and bonds thirteen times as great as the Lackawanna, and a per mile capitalization averaging more than twice as much, the Erie paid to the owners of its securities less than half as much as was paid by the former. The combined dividends and interest paid in 1910 by the Lackawanna equalled 64.20 per cent of its gross operating receipts during the year, the interest paid by the non-dividend paying Erie amounted to but 21.70 per cent of its operating receipts. The following averages per mile show that, in this instance at least, the supposed influence of capitalization upon receipts does not exist.

	Delaware, Lackawanna and Western.	Erie.
Average par value of shares and bonds, per mile	$128,214	$259,897
Average payments in dividends and interest per mile operated	24,855	8,361

Also, the same authority shows that during 1910 the more highly capitalized Erie carried all its freight at an average charge of 6.26 mills per ton mile while the Lackawanna collected, on the average, 7.29 mills per ton mile, 16.45 per cent more. These results were reversed as to passengers, the Erie collecting an average of 14.89 mills and the Lackawanna 13.86 mills per passenger per mile. Or, turning to another section, let a similar comparison be made between the Illinois Central and the Atchison, Topeka and Santa Fe. The latter supports shares and bonds having an average par value per mile of $55,770, the former has an average of $115,064, more than twice as great. Yet in interest, rentals and dividends, the less capitalized system paid, in 1910, $3,710.59 per mile operated while the greater paid $3,336.28 per mile for the same purposes. And the average receipts of the Illinois Central per unit of service were, per passenger mile, 18.27 mills and per freight ton mile 5.89 mills, while the corresponding figures for the Atchison were 20.07 per passenger mile and 10.36 per ton mile. To those who do not refuse the instruction of facts these data ought to be conclusive.

Every schoolboy learns that only co-ordinate numbers can be added but apparently forgets the principle as soon as he begins to consider the railway problem. For it is as absurd to add the par values of stock of the Lackawanna and of the Erie or (say) the Missouri Pacific as it would be to add bales of cotton and bushels of barley. Yet to make up the $15,664,250,000 "total railway capitalization" it has been necessary to aggregate these par values and those of such equally incongruous items as the defaulted bonds of the Pere Marquette, the ten per cent stock of the Union Pacific, the collateral trust bonds of the New York Central, the depreciated shares of the St. Louis and San Francisco, and so on. Such figures are misleading at their worst and worthless at their best.

Mr. Barber is greatly in error, however, in imagining that Government ownership keeps down capitalization. The Government railways of New Zealand have a gauge of three and one half feet, and are inferior in every feature of construction and equipment to those of the United States. Yet the following is the progressive record of their capitalization which now stands at an average of $52,320 per mile of line.

	Miles.	Capitalization. Total.	Average per mile.
Year 1895	1,993	$74,689,976	$37,476
Increase from 1896 to 1900	111	6,574,434	59,229
Increase from 1901 to 1905	270	24,313,737	90,051
Increase from 1906 to 1910	343	33,139,913	96,618
Increase from 1910 to 1911	36	5,317,786	147,716
Year 1911	2,753	144,035,846	52,320

So Government ownership in New Zealand has resulted in an increase in average par values per mile of 39.61 per cent in sixteen years. The recent Socialist candidate for the governorship of New York has asserted (*Pearson's Magazine*, October, 1912, p. 93) that in New Zealand "there is no increase of capitalization except for the one item of building and equipping additional lines." If he is correct, it appears that Government ownership has brought the cost of narrow gauge lines, with inferior equipment, up to the enormous figure of $147,716 per mile.

At $147,716 per mile, the railways of the United States would be worth $36,929,000,000; their present capitalization is less than $16,000,000,000. Evidently there is nothing in the argument from capitalization to justify such a tremendous departure from methods approved by American experience as the substitution of Government railway ownership for private ownership or that of public management for private management plus public regulation.

Government Management Would Not Reduce Expenses.

It is difficult to argue with a prophet. Mr. Barber asserts that the expenses of the railway business would be reduced under Government ownership and, as he offers no evidence save this assertion in support of his claim, it is impossible to say that such evidence as he has produced does not exist. But one million dollars per day, $365,000,000 annually, is a vast sum, and if it is to be saved it ought to be possible to indicate some of the sources of the saving. The railway expenses of 1910, according to the Interstate Commerce Commission, were as follows:

Taxes $103,725,701

*There has been a subsequent increase of $12,000,000 in par value of stock, sold to shareholders at its face value.

Digitized by Google

Operating Expenses:	
Paid to officers	37,448,770
Paid to employes other than officers	1,106,276,536
Other operating expenses	678,905,127
Capital Expenses:	
Interest on funded debt	370,092,222
Other interest	16,520,342
Dividends	293,836,863
Total	$2,606,805,561

It may be admitted that Government ownership would do away with the item of taxes but this would not be a saving for the sum thus lost to the Government revenues would have to be made up by taxation of other objects or in other forms. The railways are not over-officered nor do their officers receive excessive compensation; probably no one will contend that there could or ought to be any material diminution in the aggregates or in the rates of wages paid to employes of any sort. For twenty-five years operating expenses, other than wages and salaries, have been subjected to close comparative analysis by the Statistician to the Interstate Commerce Commission and for much more than that they have been scrutinized in the utmost detail by the ablest railway managers. To save $365,000,000 in this item would reduce it more than fifty per cent—the suggestion, without clear affirmative evidence of waste, is ridiculous.

Beyond this, the larger half of the $678,905,127, of railway operating expenses, not paid directly to railway labor goes to the workingmen engaged in the mining of ore, rolling of rails, building of cars, and the manufacture of other materials and supplies. Mr. Barber does not propose to socialize the production of all the commodities necessary to railway operation, and, even if he did, it is not supposed that he would recommend reductions in the wages of these workingmen.

The payments for use of capital, interest and dividends aggregate $680,449,427. This is five per cent on $13,608,988,540; if the Government could reduce the rate of interest to three and one half per cent without increasing the principal of the obligation, this payment could be cut to $476,314,599, a reduction of $204,134,828. But the best judgment of those skilled in financial operations is that this could not be accomplished. The condemnation price of the railways would probably approximate $20,000,000,000 or about twenty-five per cent more than their present capitalization and, even at three and one half per cent, the annual interest on this sum is $700,000,000 or more than the present aggregate earnings of railway capital. Moreover, the credit of the Federal Government, if it should attempt an eleven-fold increase in the public debt in order to finance railway nationalization, would not stand where it now stands but would become *the credit of the railways in the hands of the Government.* That is to say, the confidence of bond buyers would no longer be in the good faith of a solvent government pledged in support of a moderate national debt, but it would be fully understood that payment of the interest, to say nothing of the principal, of the vast new indebtedness, must depend essentially upon the financial success of government railway operation. A considerable rise in the rate of interest demanded on Government loans would therefore be inevitable.

Government Ownership Does Not Reduce Accidents.

The American accident record, in all lines of industry, is saddening beyond expression. So, indeed, is the accident record of every new or rapidly developing region or industry. The pressure of public demand for railway transportation, the impatience of public and employes with the rigid enforcement of regulations that while tending towards safety might seem to trench upon personal independence or temporarily to retard the movement of passengers or freight, the attitude of certain labor leaders and committees of labor organizations towards disciplinary changes in the force of employes, the refusal of legislators to penalize trespassing on railway tracks or infractions of rules intended to promote safety, all these have combined to produce an accident record that is not less than appalling. In 1911, the number of persons killed in the United States in accidents involving the movement of trains, cars or locomotives on steam railways was 9,957 of whom 5,284, or 53.07 per cent, were trespassers. The latter class of accidents can be reduced substantially to nothing whenever the legislatures of the several States will enact adequate penalties for unwarranted entrance upon railway rights of way. Responsibility for the remaining 46.93 per cent is less readily traced. The movement of trains is a continuous struggle with the inertia of inanimate Nature. To hurl five thousand tons along a steel track at high speed and maintain perfect safety may be attainable but the means for insuring it have not yet been discovered. Nevertheless, there are more accidents than present conditions justify and the reasons should be sought. Why, for example, is it that out of 356 passengers killed in 1911, no less than 214, or 60.11 per cent, were killed by other than train accidents—was not the far greater portion of these due to avoidable causes for which the victims themselves were responsible? Why were 292 "employes not on duty" killed, of whom only thirteen were killed in train accidents? In this connection it is well to quote a recent expression from Mr. D. F. Jurgenson, Engineer of the Minnesota Railroad and Warehouse Commission, who said:

> "No railways anywhere are better equipped with mechanical devices for safeguarding human life than are the railways of this country. Cars and locomotives of the most modern construction, equipped with air brakes of the most efficient design, are in general use. Highly perfected automatic signal systems designed to preclude the possibility of collisions are in use on many lines. Their use is being extended, although not as rapidly as might be. Yet, with all these mechanical measures, lives are snuffed out by the score because some human mind failed. With all our perfection in this direction it appears as though we encouraged carelessness through over-confidence in mechanical perfection. * * * *
>
> "What has been accomplished by Germany and other European countries in checkmating preventable accidents in railroad operation by making railroad employes amenable to the State for faithful attendance to and performance of their duties, might well be done in this country. Thus far, however, when effective disciplinary measures have been suggested as

Digitized by Google

a remedy for human fallibility or carelessness in railroad operation, the difference in the sociological and political conditions existing here have been set forth as an insurmountable obstacle."—*Railway Age Gazette, January 3, 1913.*

One thing in regard to railway accidents, however, is fairly certain, namely, that, other things being equal, they are not diminished by Government ownership and management. The following table compares the number and ratio of fatal accidents during the latest years for which data are available on the government and private railways in the principal countries where both public and private ownership exist:

	Railway mileage.		Passengers killed. Per 100,000,000 passenger miles.		Employees killed. Number employed per employee killed.	
Country	Owned by government.	Private.	On government lines.	On Private lines.	On government lines.	On Private lines.
Austria	11,783	2,353	22	7	93	19
France(*)	5,546	19,610	66	5	83	237
Sweden	2,717	5,735	2	3	21	11
Switzerland	1,705	1,238	12	0	29	2
Germany	34,892	2,216	112	3	554	9
			0.60	0.70	2,409	2,822
			3.15	.06	855	1,131
			.40	.71	1,188	1,867
			.92	0	1,214	3,269
			.48	.71	1,273	1,266

(*)Train accidents only.

The foregoing shows 214 fatal accidents to passengers and 780 to employes on 56,643 miles of Government owned railways and 18 such accidents to passengers and 278 to employes on 31,152 miles of privately owned railways in the same countries. It shows that passengers are relatively safer on the private lines in two of the five countries, without any substantial difference in favor of the Government lines in any of the others, and that employes are relatively safer on the private lines in four of the five countries, while in Germany the slight advantage of the Government lines is insignificant. If the United States is to adopt government ownership of railways it ought to be for some better reason than the false hope that it would reduce accidents.

Prevention of Strikes.

Strikes involve an interruption of business that is burdensome and may become disastrous and they express the failure, on one side or the other, sometimes on both, of fair and reasonable dealing. In the railway field of the United States they are frequently threatened but seldom occur. Practical American statesmanship has evolved a method of prevention, in the Erdman law and its very recent successor, the Newlands law, which has operated successfully for several decades. While these statutes have been operating effectively there have been serious strikes on the Government owned railways of Belgium and Italy.

The prevention of strikes is important but it is far more important that the method of prevention shall not impair the liberty of any individual than that the method should invariably succeed. The American method of prevention is that of conciliation, mediation, concession, and voluntary arbitration; the method of Government ownership is to rely upon the compulsory and the military power of the State. The right of the workman to refuse to work, for any reason satisfactory to himself, is the foundation of the wages system and the ultimate distinction between free labor and slave labor. This unqualified right to refuse to work ceases to exist the moment the State becomes the employer and the bare legal right is sure to be modified and even withdrawn whenever the Government is brought face to face with a cessation of its activities. Hence, railway employes ought unalterably to oppose Government ownership as certain, sooner or later, to impair the quality of their liberty. Under Government railway ownership in New Zealand resort has been had to so-called "compulsory" arbitration. If a strike is threatened the Government has merely to appeal to the Court of Arbitration, that is to itself in one of its manifestations, and that appeal, wholly regardless of the merits of the controversy, of its own force, makes the proposed strike unlawful and requires the employes to remain at work, though they may regard the conditions of employment as unreasonable, humiliating and utterly obnoxious. Then comes the arbitration and award and, according to Professor Frank Parsons:

> "After the award the law does not compel the employer to keep on doing business, or the employes to keep on working, but if they do keep on working and doing business in that trade, it must be in harmony with the terms of that decision."—*The Story of New Zealand, p. 323.*

The engineer, who in early manhood toiled laboriously upward until his skill and experience won the right to have an engine placed in his charge, after having spent the better part of a lifetime at the throttle, is called into court, in a proceeding in which the Government, his employer, is complainant, judge and marshal, and, as the result, is told that he must work on the Government-sanctioned terms, or, in his old age, find another occupation. And Professor Parsons adds—

> "And the stoppage, if one should occur, must be *bona fide*—anything in the nature of a strike or lockout to escape the award would be instantly checked by the court."—*Ibid, p. 323.*

Contrast with the foregoing, the following from Mr. John Mitchell, one of the most brilliant of American leaders of organized labor—

Digitized by Google

"We have heard much of late of the right to work. * * * * There is another right, however, as sacred and as inalienable, namely, the right not to work, the right to desist from work either singly or concertedly, when conditions are such as to render this action advisable and justifiable."—*Organized Labor; Its Problems, Purposes and Ideals, p. 312.*

It is most fortunate that the American Government, never having been subjected to the temptation of looking upon a threatened strike as an intolerable attack upon itself, has been able to contrive a method that is just as effective as that of New Zealand in preventing railway strikes, but that leaves every employe as free as he was before. But the American method would be of no avail under Government ownership.

Conclusion.

The writer is no irreconcilable opponent of Government ownership of railways for the United States. All that is here urged is that the arguments on both sides should be considered and the superficial and spurious rejected. No one may doubt that there now exists, in this country, a considerable sentiment in favor of public ownership and operation. Although at present unorganized, this sentiment is not unlikely soon to take form in an organized demand which would constitute a principal political issue. Hence discussion of the subject should be welcomed. Plausible arguments in favor of such a change are not wanting, although they may be insufficient and inconclusive. Certainly there is much to be said in favor of a union of control and responsibility, and, if it be true, as has been claimed, that the Government has assumed all the principal and effective powers of ownership with regard to charges, wages, and methods, but without assuming any of the responsibilities of ownership which relate to the solvency of the properties, many will conclude that the ownership might well be reunited with the control. In addition, there are two strong classes whose support of such a change may be predicted. They are (first) those perennial enthusiasts of reformation who regard every imperfection of an existing system as *proof* that *any* proposed change would be an improvement and (second) that large and influential body of conservative investors (including the owners of insurance policies and depositors in savings banks) who would gladly accept Government bonds backed by the power of taxation in exchange for evidences of railway ownership the security of which they now believe to be threatened by an increasing rigor of regulation and an augmented vigor in taxation. Consequently, there is a real danger that the United States may rush headlong to the adoption of a system that has not been over-successful even under more favorable conditions. The present is the time in which carefully to scrutinize the arguments that are made and will be made by those who favor the change.

Are American Railroads Overcapitalized?*

By Alba B. Johnson,

President of the Baldwin Locomotive Works.

NOTHING is to be gained by issuing a clean bill of health to all roads since the discovery of the steam engine. If we are asked "Have American railway companies issued stock as a bonus with bonds?" the answer is "Yes; because it was then necessary to attract investors and was consistent with the business standards of the time; the practice was once general. Moreover, in some consolidations securities were issued to a par value greater than that of the combined issues previously outstanding; also, directors have been known to operate construction companies and to issue stock to buy property from themselves."

Facts are facts, and converts are not to be won by denying them. Charles P. Neill, until recently Government mediator in railway labor disputes, says that whenever he found the employer indignant, with reason, and reluctant to arbitrate, he began the acquaintance by acknowledging that it was "an outrage." The belligerent was at once his friend, and inquired, "What do you advise me to do?" "Yield!" said the mediator, and compromise or arbitration followed. A frank admission of what has been done in the past with regard to capitalization, leaving judgment upon it to individual temperament and to Heaven, is the first step toward getting together and seeing what, if anything, should now be done about it.

If, then, as viewed by some, construction companies ought not to have been employed, or em-

Alba B. Johnson.

*From *The Saturday Evening Post.*

Digitized by Google

ployed on other terms, and the stock bonuses ought not to have been given, and the consolidations should have been accomplished, if at all, without increase of capital obligations, how serious have been the results?

Receiverships have wiped out millions of the original capitalization. There were many receiverships and many drastic reorganizations of railroads prior to 1894, but during that year 210 railroads, or twenty per cent of all the railroads in the United States, were in the hands of receivers and their reorganization was later effected by the wholesale scaling down of their original capitalization. There are no statistics available to show whether in the aggregate this was equivalent to squeezing out all the water originally contained; but many of the best informed statisticians believe this to have been the case.

Earnings which could have been paid to stockholders, as is the custom in some other countries, have on American roads been put into the property without increase of capitalization. The old rule of the Pennsylvania Railroad Company was a dollar expended for improvements for each dollar disbursed in dividends to stockholders, and for years this practice was emulated by many of the most prosperous and conservative roads. In the twenty years, 1891-1910, the amount expended for terminal improvements and charged to income account aggregated no less than $459,839,061. The rigid accounting system of the Interstate Commerce Commission was not put into effect until the fiscal year 1908, and in the years before that large sums were expended on the property and charged to operating expenses which now are required to be assigned to capital account.

Stock again, instead of being given as a bonus "representing nothing but blue sky," has to a large amount been sold for cash above par. The economist, Floyd W. Mundy, cites three cases, the New York Central, Baltimore and Ohio, and Pennsylvania, which, in 1913, he estimates had a total capital stock of $934,242,088. Of this, $547,770,653 was issued since 1900, upon which the cash realized was $620,788,035. Three of our largest roads, he means, got an average of more than eight per cent premium on at least sixty-one per cent of their total stock now outstanding. Among other effects of this policy it has served in the case of these companies to wipe out, many times over, any increases of capitalization through unearned stock dividends.

As a result of these two sets of forces—the sins of the fathers and the penance of the sons—is the burden of interest and dividends sufficiently excessive to require a readjustment of that situation before the matter of reinforcing railway credit and reinvigorating railway progress is undertaken?

Let us seek an answer by sweeping away the cobwebs of par value and per mile of line, which may mean anything or nothing, and applying a test, perhaps rarely used, but a test fundamental, comprehensive and conclusive. Let us ask: Are payments to capital excessive? There happens to be one foreign country, Great Britain, which has a considerable railway system, privately owned and operated, and yielding statistics comparable with those for the United States. How does our burden of payments to stockholders and bondholders compare with the British? What share of the receipts goes into dividends and interest on funded debt? The figures are as follows:

RAILWAY RECEIPTS AND PAYMENTS TO CAPITAL.

United Kingdom, 1911.

Receipts (returns to British Board of Trade, p. xix)	£127,199,570
Total capital (do, p. xxiv)	1,324,018,361
Average rate interest and dividends (do, p. xxvii)	3.59 per cent.
Amount of interest and dividends (computed from above)	£47,532,259

United States, 1910.

Operating revenue (Interstate Commerce Commission Statistics of Railways, p. 70)	$2,750,667,435
Net revenue from outside operations (do, p. 70)	2,225,455
Total receipts	$2,752,892,890
Net interest (do, p. 69)	370,092,222
Net dividends (do, p. 69)	293,836,863
Interest and dividends	$663,929,085

Comparison.

Interest and dividends percentage of receipts:	
United Kingdom	37.3
United States	24.1

If capital had received from American railways the British proportion of total receipts, 37.3 per cent, instead of 24.1 per cent, as was the fact, the American distribution of interest and dividends in 1910 would have been $364,772,072 more than it actually was.

Does this test of whether capitalization is or is not excessive afford an overwhelming motive for staying railroad progress in this country, while returns to owners and creditors of our roads are being scaled down?

To many, like the attorney above mentioned who wanted to call Mr. Adams and ask him about a specific road averages for all the lines of each country compared may not be conclusive. To these, perhaps, one fact in the hand is worth two in the bush. Average statistics is the bush, and the particular instance known to him is the bird in hand. How can we tell but that a considerable number of the principal American lines are carrying too heavy a burden of interest and dividend disbursements? Let us examine for his benefit an Eastern and a Western road which have been most criticized—Alton and Erie. What are the figures? Here they are:

NET DIVIDEND AND INTEREST PERCENTAGE OF RECEIPTS.

United Kingdom (1911)	37.3
United States (1910)	24.1
Alton (1910)	25.8
Erie (1910)	17.3

These figures do not excuse wrongdoing, if wrongdoing there has been, but on the other hand do they furnish reason for blocking American railway leadership as a whole in the development of American industry, commerce, agriculture and territory?

Par value of capitalization should be mentioned, lest the omission be misintepreted. Par value affords no secure basis of comparison. The usual

Digitized by Google

method is to assign capital per mile of line. This is faulty, because it leaves unanswered the question, What is a mile of line? A mile of line on an average in Texas has only 58.7 per cent as many lines of track as has a mile of line in the statistical group situated in New York, New Jersey, Pennsylvania, Delaware and Maryland, only 23.2 per cent as many locomotives and only 15.7 per cent as many cars. So of terminal cost figures; the per-mile-of-line basis means little unless we know how many miles of line there are per terminal. If two roads have each two terminals, worth $1,000,000 apiece, and one is 1,000 miles long while the other is but 500, then the 1,000-mile line has capitalization charged to its two terminals of $2,000,000, or $2,000 per mile of line, while the $500-mile road has a capitalization charged to its two terminals of $2,000,000, or $4,000 per mile of line. Cost of road construction again may be as low as $20,000 a mile on the prairie and as high as $250,000 a mile through the mountains, or $1,000,000 a mile through the city. For this and other reasons comparison of capitalization is unsatisfactory. The facts, however, for what they are worth, are creditable to American railways by such a margin as fairly to raise the question whether any conceivable allowance for difference in conditions would offset it.

The Interstate Commerce Commission, by eliminating duplications, finds as the average net capitalization outstanding in the hands of the public a figure which is given in Statistics of Railways for 1910, page 52, as $62,657 per mile of line. This compares as follows with capitalization in the principal foreign countries, the reduction to terms of American money, in view of the amounts involved, being figured on the precise basis laid down by the United States Bureau of Standards—$4.8665 to the pound sterling, 19.3 cents to the franc, 23.8 cents to the mark—and reckoning 0.62137 mile to the kilometer:

	Amount.	Excess Over U. S. (Per Ct.)
United States, 1910 (Interstate Commerce Commission Statistics of Railways, p. 52)	$62,657	
Germany, 1911 (Statistik der Im Betriebe Benefindlichen Eisenbahnen Deutschlands, p. 13) ..	113,855	81.7
France, 1910 (Statistique des Chemins de Fer Francais, pp. 334, 335)	144,683	130.9
United Kingdom, 1911 (Returns to British Board of Trade, p. xxiv)	275,156	339.1
England and Wales, 1911 (Returns British Board of Trade, p. xxiv.)	328,415	424.1

These figures, showing an excess over American capitalization ranging from 81.7 per cent in Germany to 424.1 per cent in England and Wales, are averages for all roads. "Net capitalization," on the basis used by the Interstate Commerce Commission for all the roads consolidated in one account, is not easy to compute for individual American roads, owing to the interweaving network of subsidiary corporations. To deduct from the total for the given road the securities of other roads held in its treasury still leaves a sum higher than the "net" actually is, because there would remain to be deducted the securities held in the treasury of every subsidiary, and so on in an all but endless chain. But consider the primary elimination, deducting from the total for the parent corporation only those securities of other companies directly held by it. This shows that there is no American road of considerable size which is not capitalized at less than the British average. Of American roads two hundred or more miles long, that having the highest gross capitalization per mile is the Erie. Its net figure, after making the partial deduction above defined, is $239,573. The United Kingdom shows an average for all lines 14.9 per cent higher than the Erie; England and Wales 37.1 per cent higher. The Alton net, thus figured, stands at $129,413. The French average for all roads shows 11.7 per cent higher than the Alton; United Kingdom 112.6 per cent, England and Wales 153.7 per cent higher than the Alton.

Suppose it were the railways of the United States instead of the European lines which showed excess of capitalization per mile of line 81.7, 130.9, 339.1, 424.1 per cent; would not the country visit condemnation upon our roads in good round terms? It is not good form in the United States to applaud railways. I would not suggest the indecorum of Americans throwing up hats over their impressive accomplishment in keeping down the capitalization charges on transportation; but may not one reasonably ask whether "over capitalization," according to world standards, has really been so flagrant in the United States as to constitute a national emergency? To meet it, ought the replenishment of equipment and the building of terminals for the accommodation of freight to wait?

Is the question of capitalization, then, as related to actual investment, to be ignored and railway managers left foot-free? The problem is receiving assiduous attention. Railways operating five hundred miles or more of lines which pass through States having statutes for the regulation of railway securities aggregate 198,854 miles, which is 94.6 per cent of the total in the five-hundred-mile class. The Interstate Commerce Commission is at this moment, under mandate of Congress, inquiring into railway capitalization.

Is capitalization, in view of these elaborate and concerted efforts to regulate it, a problem which absolutely must be solved as a condition precedent to revision of freight rates, stiffening of railway credit and provision for handling the expanding business of a great and growing country?

Even when instrumentalities for the regulation of security issues shall have been perfected, how certain is it that capitalization, or the return thereon, has very much to do with freight rates or can be made to have? The Baltimore and Ohio, the Pennsylvania, the Erie and the New York Central operate for the most part under a rate structure, the basis of which is the through rate between New York and Chicago, identical for all four. This rate was fixed in competition but once established it has been accepted as a standard of reasonableness, and rates between points where there is no competition are automatically influenced by that rate through custom and through the long-and-short-haul clause of the Interstate Commerce Act. The whole population served by these roads is, therefore, paying for its transportation at what may be termed the same rates. Assuming that the valuation now under way shall provide a means of judging accurately the cost of the properties, what prospect is there that these roads will prove to be "worth" even approximately the same? One has

Digitized by Google

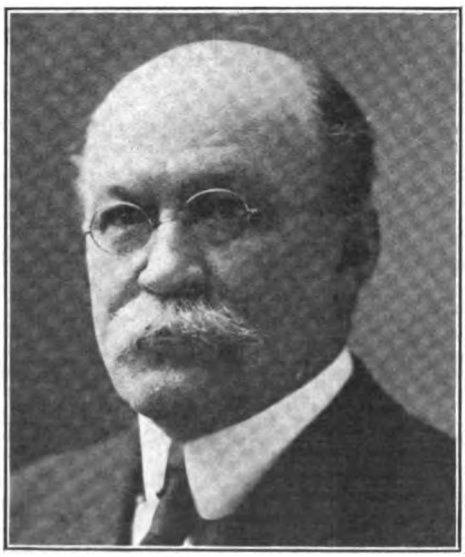
enormously expensive terminals in Chicago and New York, another not; one passes through many large cities where land is valuable and where elevated, depressed, tunnel and other costly structures have been frequent, another less so; one had to be carried over or under mountains, another traverses mainly a level country. Measuring the actual cost of the roads to the public by the sure test of the percentage of receipts paid to owners and creditors we find that the New York Central distributed in 1910 in net interest on funded debt and in dividends 11.2 per cent of receipts; Erie, 17.3 per cent; Pennsylvania, 13 per cent, and Baltimore and Ohio, 23 per cent. What, in the light of these figures, can capitalization have to do with freight rates?

The Interstate Commerce Commission, as it observed in the Eastern Trunk Line rate advance case, handed down through Commissioner Prouty, "is called upon to deal with rates as they exist, and in so doing we ordinarily consider them, not from the revenue standpoint, but rather from the commercial and traffic standpoint." He went on to declare, discussing the Baltimore and Ohio, Pennsylvania and New York Central: "Under rates reasonable for these three systems there may be lines whose earningss will be extravagant, but that is their good fortune. There may be lines which cannot make sufficient earnings, but that is their misfortune." The need of the average road was adopted by the Commission as the test. Anxious citizens, who come to see that poverty for their railway means a handicap to those it serves, may inquire what an average road is. They will at least want the door left open for making the rate level adequate for the particular road on which they depend.

Possibly we have been splitting hairs. A new railway question confronts us requiring statesmanship for its solution. When it becomes clear to enough people that the railroads have before them, in enlargement of facilities and provision for safety, a task which must be done, and which cannot be done with money now available, the Interstate Commerce Commission will have before it the demand that this work be accomplished and that conditions be made such that the roads can obtain the capital. No single adjustment for one territory or for one year will suffice. What is required is a permanent policy of protection to railway revenues.

It is to be hoped this may become a national policy. To this end business men may well study the question of capitalization for themselves. Should they perceive that it is largely irrelevant to freight rates let them frankly admit it, they and their representatives in the legislative councils of States and Nations.

Relation of the Press to the Railways



W. W. FINLEY.
President, Southern Railway.

IN a recent address before the North Carolina Press Association at Asheville, N. C., President W. W. Finley, of the Southern Railway Company, spoke on the above topic, calling particular attention to the value of co-operation between the press and the railways in community development. He pointed out that their interests were in many ways substantially identical in that they were both interested in attracting additional population and a higher average level of general prosperity. President Finley asserted that while they were thus natural allies, it did not follow that there should not be fair criticisms of the railways, but that such criticism should take account of the economic conditions under which these agencies must work, and should be of a helpful and educational character rather than tending to create unreasoning prejudice.

He pointed out that largely because the railroad must maintain business relations with a large number of widely separated communities, and because it is impracticable for its principal officers to maintain relations of personal acquaintanceship with all of the people along its lines, it is easy to excite prejudice against it. Its position therefore, can only be secured when the economic conditions surrounding its operation and the importance of its functions to development and to the enlargement of opportunity are appreciated by the people of the community which it serves. This appreciation is dependent upon enlightened citizenship and, as President Finley pointed out, the press has a moral responsibility in this connection as it is a recognized and influential agency in the molding of public opinion.

Continuing, President Finley said in part:

"In our modern system of civilization no community which lives to itself can prosper. Transportation is an essential factor to profitable production, and, economically speaking, production is not complete until goods are put in a position for consumption. It would be the height of folly for any man or set of men to establish a factory and pile goods up in a warehouse in a locality from

Digitized by Google

which it would be impossible to market them. Goods stored in a warehouse in this way would be without value. It is only when they can be moved to localities in which they are in demand that they have value. The railways are thus, in a real sense, creators of value and are an indispensable part of the producing equipment of every community and of every farmer and manufacturer in it, and it would be just as logical to carry on a campaign of unjust criticism against manufacturing enterprises and farmers as against the railways. The editor, being in constant touch with the news of the world, is in a position to take an exceptionally broad view of the relations of his own locality to other parts of the United States and to foreign countries. He knows, for instance, that cotton grown in a North Carolina field and manufactured in a North Carolina mill may reach the final consumer in a remote part of the United States or in some far off village in the interior of China or of Central Africa. He can realize that, without efficient railway service to the domestic market and to the seaports, neither the farmer nor the cotton manufacturer could prosper. Illustrations such as this might be multiplied indefinitely and it might further be pointed out that the railways of the United States are themselves large consumers of an almost infinite variety of materials and supplies and afford employment directly and indirectly to millions of our fellow citizens whose wages find their way into local channels of trade and contribute to the general prosperity of every community.

"In considering the present relations of the railways to the public, we should not be unmindful of the fact that there was a period in the history of the United States when the railways were appealed to on patriotic grounds to support principles believed to be for the best interests of the country. Under the higher standards of the present day such participation in politics is no longer required or supported by public opinion, but it is still the right of the railways, just as of any other business enterprise or individual citizen, to present their cause fully and freely before courts, administrative tribunals, legislatures, and the bar of public opinion. Enlightened public opinion in the United States will not justify the relegation of the railways to the status of the Jew in England in the Middle Ages, when, as we read in Madoxe's History of the Exchequer: "Josce Quarterbuch gave forty marks that his son Hakelin might be dealt with according to justice"; and "Jurnet of Norwich, gave 1,800 marks that he might reside in England with the King's good will."

"The railways are asking for no special favors. They ask only that their importance in the development of the country and that the interest which each individual has in their efficiency shall be frankly recognized. They ask that differences which may arise between them and individuals or communities shall be subjects of full and free conference to be adjusted in accordance with sound business principles, or that, failing such adjustment, they shall be adjudicated by the tribunals constituted by law.

"In what I have said I have endeavored to outline the condition which I believe to be necessary to the most effective co-operation between the press and the railways for community development. Such co-operation is essential to the fullest development and prosperity of any community. Intelligence and transportation are fundamental factors in our present-day civilization. It is the function of the press to disseminate the first and of the railways to provide the second."

Some Aspects of the Railway Problem

IN a recent issue of the Proceedings of the Engineers' Club of Philadelphia, Lieutenant Colonel J. E. Kuhn, of the Corps of Engineers, presented a paper on "Some Aspects of the Subject of Transportation." After dealing with the question as a whole, largely from a historical point of view, he has the following to say with regard to the present day railway situation, and the possibilities for greater economy and efficiency:

"In 1910, the railroads of the United States were equipped with 59,000 locomotives 2,300,000 cars, and employed 1,700,000 people in their service. Their outstanding capital was 18,000 millions of dollars, and their gross revenues 2,750 millions of dollars, which amounts to an average annual payment of $30 for each inhabitant for railway transportation. Successive economies in operation and administration, as well as increased volume of traffic, have reduced transportation charges to an astonishingly low figure, which has been maintained for a long period notwithstanding increasing wages, higher priced materials and increased taxes. The average freight rate of 20.9 mills per ton mile which obtained in 1865 fell steadily until in 1888 it reached the figure of 7.7 mills per ton mile, a reduction of nearly two thirds in twenty-three years. Since 1888, the average ton mile freight has remained practically stationary, being given as 7.48 mills for 1911 in Poor's Manual.

"The fact that railway management has been able to maintain freight rates in the face of the marked rise in prices of labor and material, and still pay dividends, is no mean tribute to the wisdom, energy and ability of the officials.

"Since 1890, most of the trunk line railroads have practically reconstructed their systems. Heavy expenditures, both of capital and of surplus earnings, have been invested in reducing curvature and grades, rebuilding bridges, supplying heavier equipments and in improving terminal facilities, all of which have conduced to economies in operating expenses and have enabled the railroads to maintain the present low rates. The question of greatest concern to the public at the present moment is whether we may look for a still further reduction of freight rates. On the basis of the traffic reported for 1910, a reduction of one mill in the average ton mile freight rate would effect a saving of $255,000,000 annually to the public. In view of the world-wide rise in prices, it seems hardly possible that there will be any material reduction in the cost of railway transportation. In fact, the immediate future threatens an increase of freight rates, as evidenced

Digitized by Google

by a number of applications to the Interstate Commerce Commission with this object in view.

"That further economies in railroad transportation are still practicable cannot be questioned. While we appear to have about reached the economical limit of reduction in train resistance, with our present system of track and rolling stock, there are still possibilities of considerable economies in the matter of train operation and terminal expenses. In 1880, the average freight train load was only 129 tons. In 1910, this had increased to about 350 tons. Considering the power of the modern locomotive to haul heavy loads, there is still room for considerable improvement in train loads with resultant economy. Further improvement in car capacity in comparison with car weights may also be looked for. At present freight cars have a rated capacity of from 2 to 2½ times their weight, which means that even with fully loaded cars about one third of the train is tare weight, bringing no revenue. The Norfolk and Western Railway has recently put into service a coal car of 200,000 pounds capacity, weighing 62,500 pounds, giving a ratio of 3.2 of capacity to weight. As indicating the possibilities of train loads, it may be mentioned that about a year ago a single Mallet locomotive hauled a total load of 9,120 tons on the Virginian Railway, of which 6,600 tons was paying freight. The train consisted of 120 loaded coal cars containing 55 tons each, and the haul of 120 miles was made at an average running speed of 15 miles per hour.

"In general the larger the container, the greater the proportion of the net weight of contents. Unfortunately, limitation of clearances and stability with the present gauge have placed a limit upon the height and width of cars, and the increase of but one linear dimension will not have any very marked effect in improving the ratio between net and tare weights of freight car loads. In this connection it is open to argument whether a broader gauge than standard, permitting the use of larger cars and heavier loads, with shorter trains, would not afford more economical transportation. Were it a matter only of long haul through traffic, there could be no question as to the superiority of a broader gauge, but considering transportation as a whole, the unsuitability of unduly large equipment for feeder lines and the advantage of an interchange of cars, the present standard gauge is perhaps not far wrong.

"In the matter of efficiency of freight car equipment, much remains to be desired. In 1890, statistics of 1,000,000 freight cars in service showed that the average daily distance moved was only from 17 to 25 miles, a two hours' run. In a recent article by the General Superintendent of Transportation of the Illinois Central Railroad, there appears to have been but little improvement in this particular, the average movement of all freight cars on that line being but 27 miles per day. The records showed that as an average for each month, 13 days were spent in loading and unloading, 3½ days in moving, and 13½ days standing. Even a slight increase in the daily car mileage would result in large economies, both in first cost of equipment saved, and increased revenue from equipment in use. This is a question of operation and terminal facilities, which constitute the chief fields for the practice of further economies. In comparison with haulage charges the terminal freight charges in large cities are unduly high. Congested freight stations, antiquated methods of loading and unloading cars and high cost of land are laying a heavy embargo on transportation to and from the largest cities. To remedy these conditions will call for heavy expenditures, but unless terminal facilities keep growth with the ever increasing volume on tonnage the traffic capacity of the railroads will soon attain its limit, and this long before track capacity shall have been reached. Since 1890, railroad mileage has increased 50 per cent, while the ton mileage has increased 400 per cent, and the density of traffic is susceptible of still further increases, but only on condition that freight terminal facilities and the efficiency of freight equipment be increased correspondingly.

"Whether we may ever expect any radical change in track construction is problematical. Systems of construction like the mono-rail, overhead and gyroscopic, or the sliding railway exhibited at Paris in 1889, afford promising possibilities in the way of reducing tractive resistances, but the cost of their installation has so far prevented any economical results. The question of a change of motive power, from steam to electricity is an open one. For city terminals electricity has certain advantages which have led to several notable installations, and there are indications of its extension to main line traffic where hydro-electric plants offer attractive rates for power. For the time being the question of electricity or steam is more a question of convenience than of economy, and we may expect the steam locomotive to hold its own for some time in the future. To sum up railroad transportation, further improvements in haulage costs will probably not be material, but in the matter of operation and of terminal charges there is still room for important economies."

The Reins to Those Who can Drive—A Plea for Saner Railroad Regulation

By HOWARD ELLIOTT.

MANAGER'S OFFICE, SALT LAKE ROUTE, LOS ANGELES.

THIS article is written for the benefit of one man. You see him every day. On the car to the office this morning he sat beside you. You noticed that he was neatly dressed, of dignified bearing, and that he was reading a magazine of public opinion on current events. You could tell by his appearance that he was a man of intelligence and culture, one of those whom we

Digitized by Google

class as desirable citizens, neither overeducated nor ignorant, not a radical nor a conservative, neither wealthy nor poor, not seeking publicity nor unduly modest, neither overzealous in religion nor a scoffer at the pious and devout, not so aristocratic as to be snobbish nor so democratic as to be careless of his associates—in fact, he impressed you as one of those whole-souled creatures who is content to "live in his house by the side of the road and be a friend to man," who is the bulwark of our institutions, and upon whom rests the perpetuity of the Government under which we live. His name? He is called the "Average Man," the "Representative Citizen," and with respect to his attitude on public questions, the "Man Up a Tree."

The Representative Citizen observes, as he moves among his fellows, that one of the most popular subjects of discussion relates to railroads, and he is posted on those phases of the question usually featured in the press. He reads the accounts of wrecks and notes the nation-wide demand for greater safeguards. He reads some of the decisions of the railway commissions, particularly those affecting his own immediate interests. He has read about the 28-hour law for stock and the 16-hour law for men. He remembers vividly the account of an interview with a famous railroad chief who is said to have remarked, "The public be damned." He recalls clearly the testimony of a certain freight agent to the effect that rates were made on the basis of all that the traffic will bear. He shares the opinion that railroads are grossly overcapitalized and that he is paying tribute to them in order to maintain fictitious values. He knows, too, about the evils of rebating, for has he not himself, before the passage of the Elkins bill, been a recipient of such favors, and did he not regard it as right and proper that the railroads should follow the Biblical admonition, "It is more blessed to give than to receive"? Indeed, he is "loaded" with information in regard to railroads, and has his own notions as to the best methods of financing and operating them.

Of his own business he has made a profound study and a signal success. His associates know and appreciate the value of his experience and consider themselves fortunate in having with them a man of such sound wisdom and discretion. To him they go for counsel. But his knowledge of other businesses—and this includes the railroad business—has been gained not from any actual experience, but from what he has seen, heard and read, and railroad men do not come to him for advice.

With his information on the railroad question has come much misinformation. Most of what he knows has come from reading articles in the daily papers and monthly magazines which were written by men who, like himself, had seen no service on the railroad. He has seen the same arguments against railroads reiterated so often that he has come to the conclusion that the dense volume of smoke is indicative of the presence of fire. In spite of his inherent belief in fair play, these articles have created a pronounced prejudice against the railways, because he has not seen the arguments refuted by railroad men, and he considers that silence is equivalent to acquiescence. When occasionally they do speak, he believes them biased and incapable of telling the truth. Whether or not they know what the truth is he considers of secondary importance, and while he would keenly resent any imputation of unfitness or insincerity so far as he and his business are concerned, he thinks it but natural that in seeking information on the railway problem he should go not to the fountain heads of knowledge, the railroad officials, but to others whose ideas are purely theoretical, and who give him information some of which is right, much of which is incomplete, and most of which is false. Are his ideas about his own business supported by any such foundation and superstructure as this?

The Man Up a Tree does not know that the uncomplimentary reference to the public which is accredited to Vanderbilt was probably never uttered, but was a distorted report of a disgruntled reporter. He does not know that the general freight agent who testified as to how rates were constructed did not say, "All that the traffic will bear," but did say, "What the traffic will bear," meaning that a rate was applied which would cause the traffic to move freely and leave a profit for both the shipper and consignee. He referred not only to the maximum but to the minimum, and the definition is still considered an excellent one. The Man Up a Tree does not know that the railways of the United States could not be duplicated for their present capitalization, and that capitalization has no appreciable connection with rates, nor rates with the cost of living. He does not know, and he does not ask railroad men to tell him.

The Man Up a Tree regards the regulation of railroads by Governmental authority as a distinct forward step in the march of civilization. In the light of the knowledge which he possesses, he is satisfied not only that such regulation is proper, but that without it the nation's business would be completely dominated by the transportation interests, and the many exploited for the benefit of the few. He believes, of course, in the principle of a square deal, and is willing to admit that it applies even to railroads. But he believes that under governmental supervision the roads are prospering and will continue to thrive. He reads about the enormous gross income of railroads, and the unprecedented crop movement, and he figures that if railroads are not making money under these conditions it is due to inefficient management of the properties themselves.

The Man Up a Tree thinks that instead of curtailing the powers of the commissions they should be broadened until railroad men shall be so impressed with the idea that they are public servants that they will—like the serfs of old—prostrate themselves and bare their backs for the lash imposed by their masters. They must be taught, says the Man Up a Tree, that we, not they, are the arbiters of their destiny.

Mr. Average Man, methinks railroad managers have learned their lesson and learned it well. Who knows better than they, that their powers are limited—that their business is being control-

Digitized by Google

led by others, and that while they have the responsibility without the authority the commissions maintain the authority without the responsibility. The managers need no further punishment to make them alive to the duties of their positions. But it should be remembered that the Supreme Court of the United States has said: "The public is in no proper sense a general manager." Evidently the court of last resort in this country is not in entire accord with the trend that events have been taking.

Mr. Representative Citizen, I should like to present to you a new idea, and that is that the public consider itself the vice-president of the railways. The vice-president has greater authority than the general manager. To him the manager reports. Surely this suggestion should be received with open arms. But if the public conducts itself as most vice-presidents in charge of operation do, the general manager will have nothing to fear. Nor does this invite the inference that the ordinary vice-president is a figurehead. Far from it. He is actively engaged in the operation of the road.

But let us see how the vice-president acts with respect to the general manager. Does he show his authority by vetoing everything the general manager suggests? I venture the assertion that nine matters out of ten that are passed up to the vice-president are carried out exactly as the general manager has recommended. Yet there is no question about his higher authority, and the fact that he agrees with the general manager does not lessen his control over him or the respect which the general manager entertains for his superior. The vice-president figures, and rightly so, that the road is governed best which is governed least, and that if the general manager is not running the road properly he should be removed, that the way to produce results is not to take the lines out of his hands, but to give him the reins. He can drive. Let him.

Now, Mr. Man Up a Tree, in your capacity as vice-president you know that your interests and those of the railroad are identical. Your purpose is to produce good service at reasonable rates and with profit to the stockholders—such profit as they have a right to expect from an investment in any legitimate enterprise. You know that you can make a good showing only so long as you earn a dollar by spending less than that amount, and that if reports show that the operating ratio is continually going up, you must do something to stem the tide and insure the solvency of the property. As a business man you know that there are only two ways of making a profit, either reduce the cost of production or increase the selling price, and if you have convinced yourself (as many vice-presidents have already) that the cost of production cannot be further reduced, then you owe it to the road of which you are an officer to adopt the other alternative, and raise the rates. And remember, this is something which you can do, and which the general manager, under present conditions, cannot do. Here is one method by which you may show that your authority is superior to that of the general manager, and which will inure to the benefit not only of the stockholders, but also of the country at large whom you represent in the management.

As a vice-president you deal directly with the general manager. Do you see any real necessity of interposing a "go-between," a "middle-man" to represent you in your negotiations with the general manager? It will add to the cost of superintendence, and the stockholders will be apt to say that the road is topheavy with supervision.

Your relations with the general manager can be made perfectly harmonious, and it would only "muss up the water" to appoint an intermediary. Yet you have in nearly every State in the Union (Utah and Wyoming are the exceptions) appointed such a "fifth wheel," and have so far disregarded all rules of propriety and precedent, you have to such an extent gone "contrary to established customs" as to select men who never spent a day in the railroad business and give them authority over the general manager.

And the strangest part of it is that you try to defend this system, herald it as an unqualified success, point to it with pride, yet you do not extend it to any other business which is supervised by an appointive body. There are boards of medical examiners, dental, law, pharmacy and insurance. Do you appoint insurance men to serve on boards of pharmacy, or druggists to comprise the insurance commission? Would you have much respect for a medical board composed of lawyers or a board of law examiners made up of doctors?

But the policy you reject in those appointments you employ with respect to railroads—a greater science than any of the others—for the naked fact remains that with a very few exceptions every appointee on a board of railroad commissioners in this country is a man who never spent an hour in the employ of the business he assumes to govern. The greatest railroad commission in the United States has one member who was formerly a brakeman, and he is the only railroad man out of the seven.

On a road of fifty thousand employes—and we have several such in America—there is only one president. He must have risen over the heads of 49,999 others, many of whom were nearly as well qualified as he. His selection was the result of years of application to duty which developed business acumen and sagacity of a high order. By all known laws governing the conduct of human affairs, it is right and proper that this should be so. Yet by amending and repealing those laws, men are placed on these commissions and given far greater control over the railroad business than the presidents have, who not only are not as capable as the president—they are not as well qualified as most of the 49,999 others. Is it right? What think you, Mr. Average Man?

You remember the fable of the Greek Hero who drove the chariot across the heavens from sunrise to sunset, and how his son, Phaeton, an impetuous youth, implored the father to let him drive one day. He could do it, he knew. It looked so easy. And you remember how he found the task greater than he could perform, how the steeds became unmanageable, and how both chariot and driver plunged headlong to the earth below.

I ask you, Mr. Average Man, Mr. Representative Citizen, Mr. Man Up a Tree, why not be reasonable about this matter? Why not let men do that which they are qualified to do? Instead of handing over the railroad chariots and the great iron horses to our favorite sons, why not leave them in the hands of the experienced fathers? Why not give "the reins to those who can drive?"

Railroads and Farming

By FRANK ANDREWS,
DEPARTMENT OF AGRICULTURE, WASHINGTON, D. C.

RAILROAD companies are making and for a number of years have made special efforts, apart from strictly transportation business, to promote agriculture. Within the past decade these special efforts have increased in importance. Railroad after railroad has undertaken agricultural promotion work, and region after region has been added to the territory reached by this growing movement. Early in 1912, the mileage operated by companies engaged in agricultural promotion was more than three-fourths of the total railroad mileage of the United States, and the territory affected was nine-tenths of the area of the country and contained more than nine-tenths of the total area of farm land.

During the past year (1912), this work has been extended further. New roads are being added to the list of those engaged in trying to make greater the yield of farms, and roads already so engaged are broadening the scope of their efforts. The railroads are working for the increase in traffic which naturally results from increased farm production. Better farming means more tonnage for transportation lines. About one-fifth of the gross earnings from freight carried on United States railroads is due to hauling agricultural products, and by more efficient farming, this class of traffic promises greater returns in the future. Such commodities as fruits, vegetables, and dairy products yield a comparatively high rate of return to the producer and pay higher rates of freight than such commodities as grain and hay can afford to pay. Hence these products receive much attention on the part of the railroads' agricultural experts, although other branches of farming are by no means neglected. Good country roads is a subject exploited systematically by some railroad companies. One company has for years run "good roads" instruction trains through different sections of its territory.

Most of the lines of work undertaken by railroad companies for the promotion of agriculture may be divided into two general classes. The first of these classes consists of efforts to increase the number of farmers in the regions along the railroads concerned; while the second class of work may be called educational and looks to an increase in the production of farms already established.

Efforts to Increase Farming Population.

All railroads are interested in the increase of population along their lines and a large portion of them have officials whose duty it is to solicit new settlers, especially settlers for farm lands. The title of the official at the head of such work is frequently "immigration agent" or "commissioner of immigration," but his duties are not necessarily limited to soliciting immigrants from foreign countries; in fact, that may be but a small part, or no part at all, of his work. Most of the farmers who move to the regions advertised by these immigration agents come from other parts of the United States and only a small proportion from foreign countries.

This "immigration" work was begun by some railroads as far back as 1861, and possibly ten years earlier. The Erie Railroad Company is said to have run its first immigrant train from New York to the West in 1851. In 1870 the land department of the Union Pacific Railroad was in operation, advertising 12,000,000 acres of farming and mineral land for sale. "Land-exploring tickets" were advertised. The purchaser of such a ticket was entitled to travel over a given route with the privilege of stopping over at a number of points, so that he might see the lands advertised. In case he bought a farm from the Union Pacific Railroad Company, he was to be credited with the amount he paid for his ticket.

During the construction of the Northern Pacific Railroad, its land and immigration agents were employed in soliciting settlers for the new territory that was being opened up. In 1872 the company reported to Congress that there were on file applications for 95,000 acres of the company's land in Minnesota and 45,204 acres in Washington territory.

THE FIELD PRODUCTS CAR OF THE PENNSYLVANIA RAILROAD.

Displayed in this car are 582 specimens of fruits, vegetables, grains, hay, cotton and tobacco, grown along the lines of the Pennsylvania Railroad.

The efforts of railroad companies to attract new settlers are now concerned chiefly with three general divisions of the country: One of them lies west and south of the Missouri River and west of the lower part of the Mississippi River, and extends to the Pacific Coast; the second division extends from the Ohio and Potomac rivers southward to the Gulf of Mexico, and from the Mississippi River to the Atlantic Ocean; while the third and smallest division includes New England and eastern New York. There is more or less work being done to attract settlers to other parts of the United States, included in the territory north of the Ohio and Potomac rivers and extending from eastern New York and the coast line of New Jersey, Delaware and Maryland, to the Missouri River, but this region is regarded by the railroad immigration officials rather as a source from which to obtain new settlers than as a place for them to settle. Land values in this region are relatively high, the average per acre for individual States, according to the census for 1910, ranged from $25.69 to $95.02, and the mean for all States in this region was $45.89 per acre. The mean values per acre of farm land for the other three groups of States mentioned in this paragraph were $27.79 per acre for the west and southwest; $17.21 for the south; and $25.09 for the northeast.

The most general line or phase of immigration work is the issuing of literature describing the regions to which settlers are invited. In addition to booklets and circulars, press notices are prepared for newspapers and are printed with other reading matter. Advertisements are inserted in numerous magazines and newspapers, and in some instances regular magazines are published by railroad companies. Authors and publishers are furnished with photographs illustrating something of interest concerning the agricultural advantages of certain regions. While it is to be expected that such literature would naturally call attention to the best side of the story and place little or no emphasis on the disadvantages in the regions advertised, it is nevertheless true that it is to the advantage of the railroad company to secure a satisfied settler, and much to its disadvantage to have him become dissatisfied, return home, and spread abroad unfavorable accounts of the country where he failed.

Agricultural Instruction Trains.

The second principal class of agricultural promotion efforts, it has been noted, is educational. One of the most popular of these educational features is the instruction train. This "college on wheels" is said to have been instituted some fifteen or twenty years ago by one of the most active of the present-day industrial and agricultural commissioners, and the institution has developed greatly within the past decade.

Agricultural instruction trains are examples of the co-operation of railroad officials with Government authorities. The lecturers accompanying such trains are usually members of the faculty of a State agricultural college or experts from a State experiment station or the United

Digitized by Google

States Department of Agriculture The railroad company provides the train, frequently at a low rate or no charge at all, plans or helps to plan the intinerary, and by advertising and press notices helps to attract people to the various stations where lectures are given and where opportunity is afforded to look at the exhibits in the train. Sometimes an agricultural expert in the employ of the railroad company accompanies the train and assists the lecturers and demonstrators.

The topics discussed by these train lecturers relate to many phases of agriculture. Among the subjects common to the lectures in most sections of the country are dairying, orchards, fertility of the soil, seed selection, insect pests, plant diseases, marketing, and domestic economy. In the Middle Atlantic States, from New York to Virginia, inclusive, alfalfa and potatoes have been prominent among the subjects, while in the region south of the Ohio and Potomac rivers truck growing, diversified farming, good roads, and the cotton-boll weevil have been given considerable attention. The topics in North Central States include grain, bacon production, and silos. In the Southwest, truck farming, cotton, live stock, fruit growing, and dairying have been discussed from these trains, while in the Rocky Mountain and Pacific Coast regions some of the topics were fruit growing, rotation of crops, conservation of moisture, and chemistry of the soil.

A given trip of an instruction train may be devoted to a single topic, such as good roads or seed selection, while another trip may include a variety of topics. The subjects treated by the work of one train in January, 1912, included dairying, seed selection, soil fertility, alfalfa, poultry, fruit raising, silage, marketing and soy beans.

The length of a trip of an agricultural instruction train varies from a few days to several months. The number of daily stops for instruction also varies. Some recent trains made one or two such stops a day, while other trains have made eight, nine, or more a day.

Experimental Farming.

A newer and possibly more efficient factor in agricultural promotion than the instruction train is the experimental plot worked on a private farm by the farmer himself, but under the direction of the railroad agriculturist. Hundreds, possibly thousands of such plots were worked during the past season, and probably many more will be worked in 1913. By this plan, the experimenting farmer and his neighbors are given opportunity to try new things, and often to try them entirely at the railroad's expense. The area used is small, often not over an acre. In some instances, the farmer is paid for the use of his acre, is furnished with seed, may be loaned some special implement, as a subsoil plow and is given the crop. But he must follow the directions of the railroad's agriculturalist in cultivating the plot. Some of these plots are located in New Mexico and Arizona, some along the lines between St. Paul and the Pacific Coast, and still others in the cotton belt between the Mississippi River and the Atlantic Ocean. In this southeastern quarter of the country, the farm demonstration work has recently received

a new impetus. One of the largest railroad systems serving that territory has organized a department of farm improvement, with a corps of field agents whose territory extends into every State east of the Mississippi and south of the Ohio and Potomac rivers.

Some railroads conduct their own farms to serve as experiments or demonstrations. Among the States in which railroads are conducting experimental or demonstration farms are Maine, New York, Delaware, Virginia, North Carolina, Montana, and Texas, according to recent re-

Prizes for Agricultural Exhibits.

Prizes are frequently offered by railroad companies for exhibits at agricultural fairs. One railroad gave a series of prizes for corn. One prize was awarded to the successful competitor from each county in a certain State, and a grand prize was given for the best exhibit in the State. Another company offered seven prizes, of $100 each, to competitors from the farms in the region served by the railroad.

The management of at least one system offers fine live stock as prizes. The successful competitors in boys' corn clubs are given thoroughbred boars. On another road of this system a Percheron mare was given as a State prize in each of two States, and a registered Berkshire boar as a prize in each county within a given region.

Another kind of reward offered by a railroad for success in farming is a free scholarship for a short course in agriculture at a State college. One company has offered such a scholarship to one person in each county reached by its lines, within a given State, and nearly all the scholarships were awarded the first year the experiment was made.

Work of the Railway Agriculturist.

The agricultural representative of a railroad is often engaged in work connected with farmers' associations and with special public meetings held in the interest of farming, but not necessarily connected with any permanent agricultural organization. The part he may take depends upon various conditions. He may be asked informally by officers of an association for some advice on a special topic, he may make an address at a public meeting, or he may simply attend a meeting to learn more of agricultural conditions in his territory and to get better acquainted with the farmers. Again, he may take a leading part in forming associations. One railroad company recently sent an official over its lines to organize live-stock breeders' associations in nearly every county entered by the road. These associations once formed were encouraged by the railroad to hold sales of registered stock.

The agriculturist of still another road devotes part of his time to organizing co-operative marketing associations and to helping them find markets for their produce. In one of the South Atlantic States there were in 1911, five alfalfa clubs organized, partly through the efforts of a railroad agricultural official. Two other similar officials, one in the Southeast and the other west of the Mississippi River report considerable activity in promoting boys' corn clubs.

In at least one old farming region, where there is a considerable number of newly arrived farmers, a railroad company endeavors to bring old and new residents together by means of public agricultural meetings, in order to promote a neighborly feeling and make the new residents better satisfied with their homes.

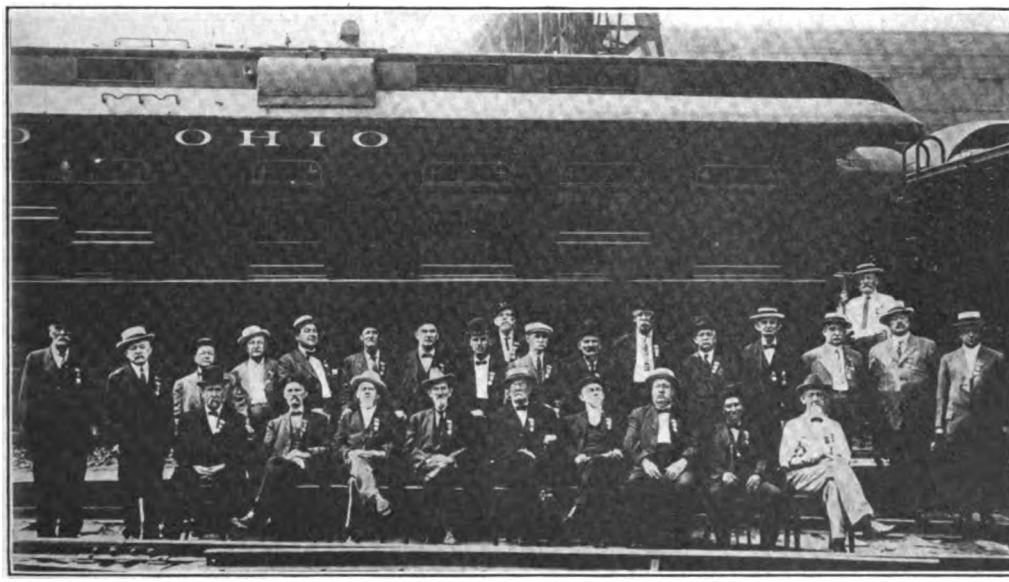
The agricultural promotion work of railroads is primarily intended to increase traffic. Large crops mean large tonnage. Prosperity for the farmer results in him making greater purchases, thus adding another increment to tonnage carried by rail; and prosperity also gives the farmer and his family more opportunity to travel, thus tending to increase railroad earnings from passenger traffic.

There is an indirect effect of such promotion work, which may become important in the future, if it has not already made itself felt. The co-operation of railroad companies with farmers, where both parties are seeking a common end—to get more out of the soil—tends to develop a mutual good will. And it is natural that the good will growing under such conditions may contribute toward the solution of some of the present-day economic problems, in which railroads and farmers appear to have opposing interests.

The Baltimore and Ohio's Sixtieth Anniversary

DURING the semi-centennial celebration at Wheeling of the admission of West Virginia as an independent State of the Union, the Baltimore and Ohio Railroad commemorated the sixtieth anniversary of its completion to the Ohio River. The old locomotives that ran from Baltimore to Wheeling sixty years ago were taken out of storage and exhibited at Wheeling, under steam, and were run by veteran railroad men now retired, who returned to active service for this occasion. The total years of service of those who took part in the celebration were 775.

With the single exception of the horse-drawn



BALTIMORE AND OHIO VETERAN LOCOMOTIVE ENGINEERS AT WHEELING, W. VA.,

on the occasion of the semi-centennial celebration at that city. Though now all on retired list, these men returned to active service for the week of the celebration and manned early types of locomotives and cars. 775 years of total service are represented by the group.

car of 1830, every example was the original locomotive. Realism thus accentuated was further heightened by the movement under steam, this being pre-eminently the age of "seeing the wheels go 'round." The old engines were run under steam in the old Hempfield Yard, where they remained during the week, and on one of the days all were marshalled in a parade presenting a spectacle the like of which may never be witnessed again.

Old types of locomotives that in their day marked progress in railroad development as suggestively as the "Mallet," "Mikado" and "Pacific" of these times, once more came to life and were living, breathing things. Stacks that had not vomited smoke, fireboxes that had known no heat, boilers that had remained cold and piston rods motionless from a quarter to a half century showed that they could "come back," as the sporting phrase has it, and great was the wonderment of the younger generation. Not only to the younger generation but to their elders was it an unforget-

able lesson in advancement. The comparison of these little engines with the monster ones of the Mallet type was most striking.

The old Hempfield Yard, a square now in the very heart of the city, into which came the Baltimore and Ohio years ago, could not have been

better located for the showing had it been planned as a stage in a great amphitheatre. Its tracks abutting on a main thoroughfare directly opposite the City Hall and with wide avenues affording equally ready access, there were no crossing of tracks and the usual complexities of railroad yards to encounter in getting from one part to another. The yard contributed a huge level stage and upon it flocked thousands, not only curious as to the old manner of train propulsion but deeply impressed with what 80 years have wrought in its development.

For the parade the locomotives were backed down the residence-skirted track over which the Baltimore and Ohio trains to Pittsburgh pass. Interest was absorbing, for the head-on return was to illustrate in chronological order the progression from the shanty on wheels that antedated the locomotive to the amazing "Mallet" of to-day, which in length and bulk dwarfed the adjacent houses.

The old horse-car headed the pageant, drawn by a grey horse, its driver perched high in front with one foot on the bar for controlling the car as in the stage coach of the period.

Then came the "Atlantic" of 1832, the oldest locomotive on the continent in its original form. The upright boiler with its bunched mechanism provoked curious comment and its queer feature of the high-jointed perpendicular piston rods caused one to instantly think of a huge grasshopper jumping along.

Next in line was the "Thomas Jefferson" of 1834 of the same type as the "Atlantic," but with cab and otherwise improved as she was during a service extending over 40 years, drawing an old four-wheel passenger coach of 1838. This coach is in the form of a road stage coach in vogue about 70 years ago, its rounded body and two cross-wise seats facing each other, with a carrying capacity of about six or eight persons.

Immediately behind the "Thomas Jefferson" and coach was the "Mississippi" of 1837, the first locomotive seen west of the Mississippi. She was designated by the crowds that thronged the yard as "the engine that is all stack," and upon seeing it for the first time it certainly did impress one that way.

The Cumberland Valley "Pioneer," the Seth Wilmarth type of 1847 locomotive, followed, drawing an old combined passenger and baggage coach of 1855. The "Pioneer" in 1860 made a special run from Harrisburg to Chambersburg drawing her regular train of one or two coaches in 68 minutes, including two stops of eight minutes each for wood and water, averaging very close to a speed of a mile a minute.

The North Western "Pioneer" of 1848 came next. The line that she ran upon was the old Chicago and Galena road, now a part of the Chicago and North-Western System, and was the first locomotive seen in Chicago when put in service.

Then came the "Dragon" of 1848. This locomotive was an early eight-wheel passenger type of the period, built by the Baldwin Company for the Baltimore and Ohio Railroad and saw many years of service.

After the "Dragon" was the "Camel" of 1850 and the type of freight power in use on the Baltimore and Ohio when completed to Wheeling. Many of the old railroaders around that section of West Virginia still remember seeing this class of engines in active service.

Bringing up the rear of the pageant was the enormous three hundred ton mountain grade locomotive, the "Mallet." The "Mallet" in full working order weighs 43 times as much as the Grasshopper "Atlantic."

Future of Panama Railroad

AT a meeting of the Board of Directors of the Panama Railroad Company, held in Washington, on June 19, to consider the future of the railroad, and its steamship line, the vice-president laid before the board communications from thirteen directors of the Panama Railroad, and of the Naval and Military Board, setting forth, in response to a request of the company, their individual views as to the advisability of continuing the operation of the railroad and steamship lines, and their conduct under the private charter of the company.

After a full consideration of these several views, it was unanimously concluded that the operation of a railroad over the Isthmus was both a military and a commercial necessity, and that for the purpose of maintaining a constant and adequate supply of provisions and materials upon the Isthmus for use in connection with the Canal and railroad, and of establishing reasonable prices with respect thereto, and for the purpose of maintaining a line of transportation at reasonable rates between the United States and the Isthmus, available to the employes, officers, and soldiers of the United States, and their families, domiciled upon the Isthmus in connection with the maintenance, operation, and protection of the Canal and railroad, it was highly advisable, if not necessary, that the Government should maintain a steamship line either directly, or through the agency of the Panama Railroad Company, between New York and Colon.

It was further the opinion of a large majority of the directors submitting opinions, and of all present and participating in the discussion, that for legal and practical reasons, it was inadvisable for the Government of the United States to surrender at the present time the charter of the Panama Railroad Company. This charter was granted by special Act of the Legislature of the State of New York in the year 1849, and which charter conferred valuable privileges not easily obtainable at the present time, including the right to operate a steamship line in connection with the railroad. Moreover, the title to land grants conferred upon the Panama Railroad Company by the Republic of New Granada in connection with the original concession, and the concessionary rights for the exclusive maintenance and control of all railway and water transportation routes across the Isthmus of Panama, were vested in the railroad company. These rights so vested have been subsequently recognized by the Republic of Colombia, and the Republic of Panama. It was further considered that the Panama Railroad by reason of its exemption from governmental restrictions with respect to advances, and the collection and disbursing of funds, was capable of discharging a general transportation duty toward the public in the operation of its railroad and

Digitized by Google

steamship lines, which could not be discharged by the Government of the United States operating directly without substantial amendments to the general statutes.

It was the opinion of the majority of the directors that, in the absence of an expression to the contrary by Congress, no good reason was perceived, why, in connection with the operation of the railroad and steamship lines, they should not be allowed the use of its available space for the transportation to and from the Isthmus of commercial cargo. It was considered in this connection that the establishment of local rates between New York and Panama might have an indirect bearing upon the prices at which commodities might be handled by private merchants, and others upon the Isthmus, and thus indirectly redound to the benefit of the American population resident upon the Isthmus in connection with the operation, maintenance, and protection of the Canal. It was finally unanimously agreed, inasmuch as Congress under various Acts and Resolutions had recognized the continued activities of the Panama Canal, and in the Act of August, 1912, had authorized the continued use of the Panama Railroad Company for the purpose of discharging the duties and functions assumed by the Government in connection with the operation of the Canal, or thought desirable in reasons brought forth in the discussion, that no change of policy in the operation of the Panama Railroad and steamship lines should be declared until such time as experience may have demonstrated that a change were advisable, or until such time as Congress may have indicated by legislation that the policy of the Government with respect to this company should be modified or reversed.

Thereupon it was unanimously

Resolved, That, except as the emergencies of the company's traffic may make changes necessary, there be no change in the present method of operating the Panama Railroad and its steamship line.

The Relations Between Local Agents and the Traffic Department

By EDWIN H. LEA.

WE are all in a sense members of one great family, to each branch of which is assigned certain duties and responsibilities, the combined faithful performance of which tends to perfect methods and adjust conditions on politic lines. Thus equipped and working as a unit transportation troubles will be few and our tons and friends be many.

In the local agent is concentrated a larger percentage of representation of the other family branches than perhaps any other subordinate employe; he is, at times, the sole representative on the spot, and on his line of judgment, manner or action, is adjusted the pivotal point of public opinion for or against the family at large. It is sometimes erroneously conceded or individually assumed that the local agent is responsible only to the transportation branch of our family, and that so long as his duties pertaining to this branch are satisfactorily performed his position is reasonably safe. While an agent may for a time be successful in accomplishing this end under such a misapprehension of his full duty, he is like the seed sown in stony places: "He endureth only for a while," and fails to grow in individual influence, either in his own branch, in the family or among the patrons with whom he comes in contact. The greater his knowledge of and his interest in the other branches, the better fitted he is to represent the family at large, dispense information, and exercise tact in the performance of his duties.

Among the larger branches of our great family is the Traffic, or originating, department, on whom devolves the responsibility of encouraging and securing for transportation, a sufficient tonnage volume of various commodities moving in all directions, to maintain a revenue income of such proportions as will meet reasonable operating expenses and leave something for the stockholder. The heads of this branch are largely dependent for success in the direction indicated, on the individual efforts of every other member of the family at large, each of whom has, or can exercise, an influence directly or indirectly, favorably or unfavorably, on the revenue results. The necessity then for hearty co-operation with this branch is apparent to any sensible and loyal employe, and to none more than to the local agent who in his position, has so many opportunities to encourage and develop traffic and make friends for the entire family. The following simple rules suggest themselves to my mind as great helps towards increasing an agent's influence as a traffic representative:

First.—Personal affability, thoroughly impregnated with knowledge of all details properly pertaining to his position.

Second.—Absence of deception and the presence of personal interest in all transactions with the public.

Third.—Maintenance of a standard of subordinate efficiency.

Fourth.—The enforcement of the rules of politeness towards the public among those under his supervision.

Fifth.—Keeping the Traffic Department posted as to local conditions, tonnage variations, and prospective freight movements.

The adoption of, and compliance of these rules, will develop an up-to-date, influential agent, whose qualifications will embody traffic representation of a high order and create for him an influence among the family at large that will result in meritorious reward, returning to him a high rate of interest on the investment of years of training along the line of intelligent, energetic, conscientious, and co-operative work. He should remember always that in every revenue dollar there is an element of cost that can be appreciably increased or decreased in proportion as his traffic qualifications are tactfully exercised in securing new business.

This question of co-operative work is deserving of thoughtful consideration, the result of which should be an individual determination on the part of each local agent to become from now on a brighter traffic light in his home territory, so that the combined reflection therefrom would not only brighten the traffic canopy of his own line but that of the whole transportation world.

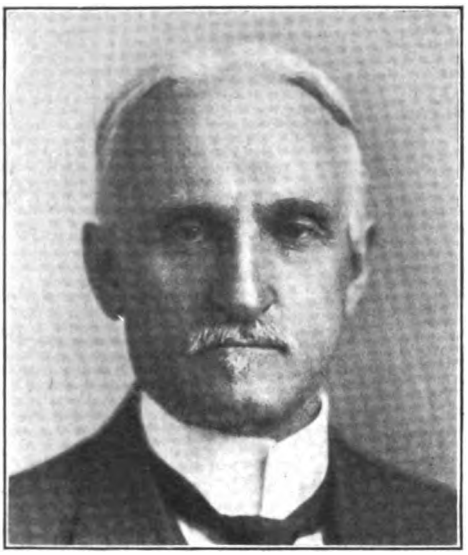
Personal



WILLIAM P. CLOUGH.

William P. Clough.

WILLIAM P. CLOUGH, who for more than a year has been first vice-president of the Northern Pacific Railway, has been made chairman of the board of that road, this new office being created on account of the resignation of Howard Elliott as president. The elevation of Mr. Clough to this position constitutes an expression of appreciation on the part of the Northern Pacific directors of the responsible executive duties which he has been discharging during the past twelve years, but does not indicate, to any radical extent, the change in such duties.

Mr. Clough was born in New York State, and entered railway service on October 1, 1880, as general counsel in the west for the Northern Pacific, occupying that position until June 1, 1887, when he entered the executive department of the St. Paul, Minneapolis and Manitoba as assistant to the president, soon after becoming a director and the second vice-president of that company.

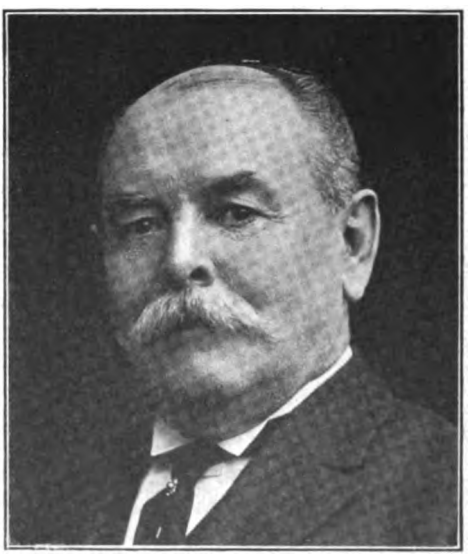
February 1, 1890, when the St. Paul, Minneapolis and Manitoba was taken over by the Great Northern, he became a director and the first vice-president of the latter company, and remained in those positions until the summer of 1901, when he resigned them to become a director of the Chicago, Burlington and Quincy, and a director and a member of the executive committee of the Northern Pacific, which positions he has continued to hold, and which, for the past twelve years, have chiefly occupied his time. On July 1, 1912, he became first vice-president of the Northern Pacific.

Jule M. Hannaford.

JULE M. HANNAFORD, who has recently been selected for the presidency of the Great Northern Railway Company, is a self-made man and one who has gained the respect and admiration of his fellow men by his close application to duty and his desire to deal fairly with the employes of the great organization with which he is identified. He was born in 1850, and at the age of sixteen entered railway service, a poor boy, without money or influence.

In May, 1872, he entered the services of the Great Northern, with which road he has remained until the present day, constantly advancing until he has reached the highest position in the service of his company. His career, briefly sketched, is as follows:

From May, 1872, until May, 1879, he was chief clerk in the general freight office; May 1st, 1879, to May 1st, 1881, he was assistant general freight and passenger agent. May 1st, 1881, to August 1st, 1883, he was general freight agent of the Eastern division. August 1st, 1883, he became assistant superintendent of freight traffic, holding that position until March 1st, 1884, and from that date until May 1st, 1886, he was the general freight agent of the Main Line and branches. May 1st, 1886, to March 15th, 1893, he was the traffic manager, and from March 15th, 1893, to February 1st, 1899, he was the general traffic manager of the road. April 1st, 1890, Mr. Hannaford took the office of general traffic manager of the Wisconsin Central Lines, during their lease to the



J. M. HANNAFORD.

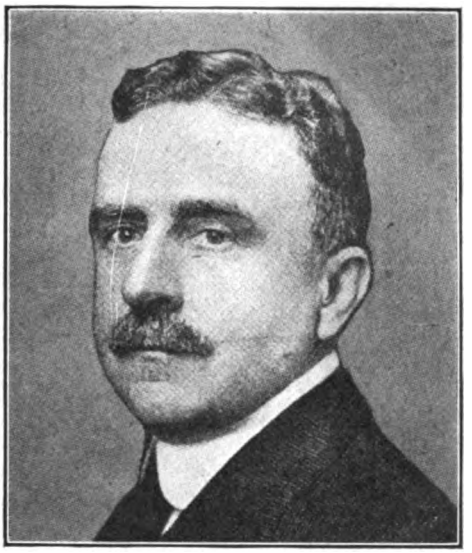
Northern Pacific Railroad Company. February 1st, 1899, he became third vice-president, and on April 1st, 1902, he was advanced to the office of second vice-president of the Northern Pacific Railroad Company. He is also president of the Northern Express Company.

J. M. Johnson.

J. M. JOHNSON, vice-president in charge of traffic of the Missouri Pacific and the St. Louis, Iron Mountain and Southern, who has been appointed vice-president in charge of traffic also of the Western Pacific and the Denver and

Digitized by Google

J. M. JOHNSON.



JAMES H. HUSTIS.

Rio Grande, was born May 13, 1845, at Cincinnati, Ohio. He was educated in the public schools, and began railway work January 1, 1871, as station agent for the Indianapolis, Cincinnati and Lafayette at Franklin, Ind. He was successively general freight and ticket agent of the Cincinnati and Martinsville and traveling auditor of the Indianapolis, Cincinnati and Lafayette until 1877, when he was placed in charge of the local freight traffic of the latter road. From November, 1879, to January, 1883, he was assistant general freight agent of the Indianapolis, Cincinnati and Lafayette, and the Cincinnati, Lafayette and Chicago at Lafayette, Ind. He was then made assistant general freight agent of the Cincinnati, Indianapolis, St. Louis and Chicago in charge of freight traffic originating in Chicago and the Northwest, and on March 1, 1884, went to the Chicago, Rock Island and Pacific as first assistant general freight agent. Four years later he was promoted to general freight agent of that road; from March, 1896, to March, 1899, was freight traffic manager, and on the latter date he became third vice-president. Mr. Johnson left the Rock Island on April 1, 1903, to accept the position of assistant to the vice-president of the Gould Lines, and on November 1, 1907, he was made vice-president in charge of traffic of the Missouri Pacific and the St. Louis, Iron Mountain and Southern, with headquarters at St. Louis, Mo. His jurisdiction is now extended over the Western Pacific and Denver and Rio Grande, as above noted.

James H. Hustis.

JAMES H. HUSTIS, vice-president of the Boston and Albany, who is to become president of the New York, New Haven and Hartford, on November 1st, subject to the approval of the board, succeeding Howard Elliott, who, on that date will become chairman of the board, was born in New York City, in 1864, and began railroad work as office boy in the general manager's office of the New York Central and Hudson River Railroad. In 1891 he was appointed trainmaster on the Harlem division, and two years later was made assistant superintendent. In 1900 he was appointed superintendent of the Harlem division was later made superintendent of the River division (the West Shore), and served as superintendent of the Rome, Waterloo and Ogdensburg, of the Hudson division and of the Putnam division. In 1907 he was made general superintendent of the western district, and in October of the same year was given charge of the Boston and Albany with the title of assistant general manager. In June, 1911, he was given the title of vice-president, and the operation of the Boston and Albany was put entirely in his charge.

Mr. Hustis is a member of the board of directors of the First National Bank of Boston, and of the Newton Trust Company of his home town. He is also a member of the Boston Chamber of Commerce.

Mr. Hustis' record with the Boston and Albany has proven him eminently fitted for larger responsibilities. The improvement of the road has been continuous under his management, and he has succeeded in establishing a standard of service which might well present a model for the rest of the country. He has the rare quality in an executive of commanding the respect of his subordinate, while never for an instant standing aloof from him. With two such men as Mr. Elliott and Mr. Hustis in active control of the future developments of the New Haven, it can confidently be predicted that within a short time New England will be in possession of one of the most progressive and efficient transportation plants of the country.

C. E. Perkins.

C. E. PERKINS, the new freight traffic manager of the Missouri Pacific-Iron Mountain System, was born in Chicago, in 1871, and moved to Kansas City as a child, and there began his railroad service in 1891 as office boy in the freight office of the Kansas City, Fort Scott and Memphis. After five years of service with that line he went to the Frisco as chief clerk for the general agent at Kansas City. In 1897, Mr. Perkins became chief tariff clerk for the Kansas City, Pittsburgh and Gulf, now known as the Kansas City Southern. He was made chief clerk in the

Digitized by Google

C. E. PERKINS.

freight department and later assistant general freight agent. For a time he was stationed at Texarkana as assistant general freight agent and also as general freight agent for the Texas line of the road. He was brought back to Kansas City as assistant general freight agent at headquarters in 1906, and in March, 1909, came to St. Louis as assistant general freight agent of the St. Louis, Iron Mountain and Southern Railway. On January 1, 1910, he was made general freight agent of the Iron Mountain. On June 1st of this year he was made assistant general traffic manager of the Missouri Pacific-Iron Mountain, and on August 1st became freight traffic manager of the system.

W. A. Barrows.

W. A. BARROWS, who has recently been appointed general passenger agent of the Boston and Albany Railroad, has been

W. A. BARROWS.

with this road for the past twenty-one years, serving it in various capacities, principally in the freight traffic department. At the time of his appointment he was assistant general freight agent, but owing to his long association with the road, had an intimate knowledge of its passenger business as well as its freight. He has a wide acquaintance throughout the territory in which the road operates, and it is believed, will prove a strong factor in increasing the good will of its patrons.

W. W. Croxton.

WARNER W. CROXTON, who recently became general passenger agent of the Atlanta, Birmingham and Atlantic Railroad, was born in Virginia, in 1881. After a high school education, he entered the freight department of the Southern Railway as stenographer at Richmond, Va., on June 1, 1900. He remained stenographer and clerk in various offices of the

W. W. CROXTON.

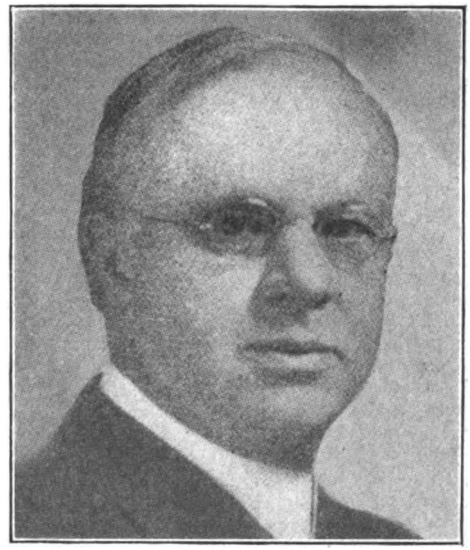
Southern until October 1, 1902, when he was appointed secretary to Mr. S. H. Hardwick, then general passenger agent. Since then he has held the following positions with the Southern: April 1, 1904, passenger agent at Norfolk; October 1, 1905, traveling passenger agent, New York City; April 1, 1907, transferred to Norfolk, Va., to handle Jamestown Exposition traffic; September 1, 1908, traveling passenger agent at Baltimore, Md. On September 1, 1909, he accepted appointment as assistant general passenger agent of the Norfolk Southern, with office at Norfolk, and one year later was made general passenger agent of that road. The latter position he held until his appointment as general passenger agent of the A., B. and A.

A. C. Shaw.

A. C. SHAW, who was recently elected general passenger agent of the Canadian Pacific Railway, with headquarters at Winnipeg, Man., was born in Detroit, in 1865. After receiving a normal school education, he entered railway service in 1880 with the Great Western Railway Company of Canada, as ticket clerk. In 1882 he left railway services to engage in commer-

Digitized by Google

A. C. SHAW.



EDSON P. RICH.

cial business, but re-entered it again in 1886, as stenographer to the district passenger agent of the Canadian Pacific Railway at Toronto. The latter part of the same year he was transferred to the general passenger department of this road at Montreal, where he occupied several positions until December, 1900, when he became general agent of the passenger department, which position he held until November, 1910, when he was made assistant general passenger agent. In July of the present year he became general passenger agent.

Edson P. Rich.

EDSON PROSPER RICH, who recently was made assistant general solicitor of the Union Pacific, in addition to his duties as general attorney for the States of Iowa and Nebraska, as has already been announced in these columns, was born August 15, 1858, at Griggsville, Ill. He was graduated from the University of Nebraska in 1884, and took a post-graduate course at the Johns Hopkins University in 1884-1885. Mr. Rich was made assistant attorney of the Union Pacific for Nebraska in 1900, and from 1903 to 1904 he held the position also of general claims attorney for the entire system. In 1908 he was appointed general attorney for the States of Iowa and Nebraska, and effective July 1 this year he was made assistant general solicitor, still retaining the title of general attorney for Iowa and Nebraska, as above noted. The headquarters of Mr. Rich are at Omaha, Neb.

Financial

General Developments During August.

WHILE the present financial situation leaves much to be desired, the improvement noted in July continued during August. The money situation is in far better shape than it has been for some time, relief coming from various quarters, notably from Washington and Europe. The more recent reports from the West with regard to the grain crops have also produced an easing influence in that it is now certain that such crops will be moved with less strain than had been expected. During the month the Secretary of the Treasury apportioned to the banks in the South and West over $46,000,000 of the $50,000,000 promised these sections to assist in moving the crops. Whether or not the Secretary's action is subject to criticism on the basis of inflation, the fact remains that it has been successful in bringing about an easier condition in the money market causing freer offerings of time money and a lowering of rates. The new currency bill, although likely to be subjected to many changes before its final passage, stands in its present shape for a more elastic form of currency than we have under the present law. How far Congress will go in adopting the modifications suggested by the bankers at the conference which they held in Chicago last month, would be hard to foretell, but there is every indication that before Congress completes this work it will have provided a currency bill far in advance of anything heretofore attempted.

Other developments during the month were the declaration of peace between the warring countries of Europe and the growing belief that our intervention in Mexican affairs would not be necessary. The latter situation is, of course, still charged with uncertainty, but hope is growing stronger that a peaceable solution will be found. In upholding with firmness the principles of strict neutrality and a determination on the part of this country to refrain from invasion, the President has taken a position which meets with the general approval of the American people, and places the country on a firmer moral foundation should intervention become unavoidable later.

Both the stock and bond markets have shown

Digitized by Google

some recent improvement but the future is still being viewed with considerable uncertainty and conservatism. The marked deterioration in the corn crop has proved a disturbing factor, while tariff developments continue to cause a cloud of uncertainty to envelop many industrial and manufacturing enterprises. Reports are also being awaited regarding the cotton crop and later grain estimates, as well as unfilled tonnage statements of the United States Steel Corporation. So far as the steel situation is concerned, it is reported that a decidedly better tone is evidenced in finished lines and consumers are buying more heavily with the conviction that prices have about reached the lowest point. Railroads are not heavily in the market, but there have been enough recent orders to show a fair activity. Taken as a whole, it is believed that the United States Steel Corporation's business for August is likely to show a slight improvement over the July orders, while independent companies for the most part report a similar condition.

Railway Dividends.

AUGUST developed two important reductions in railway dividends; one by the Cleveland, Cincinnati, Chicago and St. Louis and the other by the Chesapeake and Ohio. The action by the directors of the Big Four involved passing the quarterly dividend on the preferred stock, while the Chesapeake and Ohio, by declaring a quarterly dividend of 1 per cent, reduced such dividend from the 1¼ per cent base which had been in effect since 1911. The directors of the Hocking Valley Railroad, however, which is controlled by the Chesapeake and Ohio, have declared a quarterly dividend of 2 per cent as compared with one of 1¼ per cent previously in effect.

The reasons given for passing the Big Four dividend are concerned with the enormous repair bills and higher costs incidental to the great floods which occurred in the Middle West during March. Regarding the reduction in the Chesapeake and Ohio Railroad's dividend Chairman Trumbull, of the board, states that in view of last year's conditions the 4 per cent rate was conservative, and asserted that the outlook for the current year indicated that the company would earn fully 7 per cent. "During 1912-13," said Mr. Trumbull, "the floods and coal strikes in the territory served by the Chesapeake and Ohio reduced the earnings on the stock by about 2 per cent. The direct property loss was $350,000, but attendant losses in traffic, etc., brought this figure up to practically $1,000,000, all of which had to be taken out of earnings."

The current calendar year thus far has witnessed the reduction or passing of dividends by eight prominent railroads with a loss to their stockholders of almost $9,400,000 per annum—a sum equal to 5 per cent on almost $200,000,000 of invested capital.

Below is tabulated the railroad dividend cuts of the year thus far.

	Stock outst.	Old rate.	Pres. rate.	Act. div. reduction.
Bangor and Aroos	$3,198,600	4%	2%	$64,000
Boston and Maine	39,505,000	4	..	1,580,000
Bost n and Me. pfd	3,149,800	6	..	189,000
Ches. and Ohio ..	62,792,000	5	4	628,000
C. C. C. St. L. pfd.	10,000,000	5	..	500,000
Illinois Central ..	109,288,000	7	5	2,185,700
New Haven	180,000,000	8	6	3,600,000
'Frisco 1st pfd. ..	5,000,000	4	..	200,000
West. Md. pfd. ..	10,000,000	4	..	400,000
Total				$9,346,700

September Disbursements.

TOTAL dividend and interest disbursements for September, 1913, are estimated by Dow, Jones and Company at $114,000,000, as compared with $108,000,000 last year.

Up to the present time dividends declared payable in September by New York City banks and trust companies and the various corporations of the United States aggregate $63,096,646, based on a total capitalization of $3,069,394,985.

Interest payable in September on the bonds of railroad, industrial and miscellaneous companies, as well as those of cities, states and counties in the United States and the Government debt totals $50,896,456. The total of bonds of every class outstanding upon which this interest is payable in September is $2,085,011,000.

The following table gives the interest and dividend disbursements for September, 1913, in detail, showing the capitalization on which the various payments are made:

Companies.	Capitalization	Dividends.
Railroads	$1,205,530,335	$25,536,586
Industrials and misc. ..	1,637,590,000	33,468,500
Electric railways	199,274,650	2,421,560
City banks and trust cos.	27,000,000	1,670,000
Total	3,069,394,985	63,096,646
	Bonds.	Interest.
Railroads	$1,315,653,000	$28,819,039
Industrial and misc. ...	323,772,000	8,023,145
Street railways	242,316,000	5,987,375
State and city	153,270,000	3,291,897
Government	50,000,000	375,000
New York City	.....	4,400,000
Total	$2,085,011,000	$50,896,456

TOTAL DISBURSEMENTS.

	Capitalization	Disbursements
Dividends	$3,069,394,985	$63,096,646
Interest	2,085,011,000	50,896,456
Grand total	5,154,405,985	113,993,102

The Bond Market.

THE bond market showed distinctly encouraging signs of improvement during the latter part of August. This was aptly illustrated in the sale to Kuhn, Loeb and Company and Speyer and Company by the Pittsburgh, Cincinnati, Chicago and St. Louis Railroad, of $7,000,000 of consolidated mortgage 4½ per cent bonds. These bonds were first offered to the investor at par and later 100½ was asked in the New York market. It is reported that the public was quick to realize the advantage of getting these bonds at par and that in a short time few were left in the hands of brokers. Easier money is responsible for this improved tone, which it is anticipated will continue through September. Bonds are generally holding the price gains made over the low of the year and floating supplies are believed to have been pretty well absorbed. This indicates that if any considerable buying movement should start in, prices would undoubtedly harden.

The two issues which now have almost the clear field in investment bankers' attention are the Southern Pacific stock offering and the New Haven 6 per cent convertible debentures. Some of the members of the Southern Pacific underwriting syndicate are expecting that 40 per cent to 50 per cent of the $48,000,000 will be left for them to dispose of. The amount will be known after September 2. The New Haven debentures are expected to be in better demand among New Haven stockholders, and the underwriting bankers seem likely to get few of them. A policy of going slow

Digitized by Google

in the matter of bringing out new issues is recommended by practically all bankers. This would allow the improvement in the market to continue until it reached such proportions that there would be no danger of new issues swamping the market

New York transactions for a number of weeks are indicated by the following figures:

August 16....	$7,727,500	July 26.....	$9,339,500
August 9....	7,556,025	July 19.....	6,805,500
August 2....	7,652,000	July 12.....	7,730,500

While these totals indicate comparatively small sales, the fact remains that bond prices generally, have had a good rise in the past two months, the average advance since the middle of June having wiped out at least a third of the decline which occurred from the opening of the year to June. There is reliable testimony that capital has been accumulating and while there is still an absence of liberal credit particularly in its application to railroad bond issues, conditions are improving. How long it will take, however, to reach a normal market is something which even the shrewdest bankers feel they cannot discuss with any assurance.

The Situation Abroad.

REPORTS from abroad are generally favorable. London reports the development of many favorable influences which may be the herald of one of the most active and prosperous autumns, which the stock exchange has yet encountered. The international situation no longer causes any anxiety, and the latest threat of Turkey against Bulgaria in connection with the former's re-occupation of Adrianople is not taken seriously in any direction. The belief is still confidently held that if Turkey loses her head and endeavors to unduly exploit the temporary weakness of Bulgaria she will be brought to her senses by a demonstration of the Powers at Constantinople. For the rest, peace has been formally re-established between Bulgaria and her former allies. The Chinese rebellion has collapsed, and better news is coming to hand from Mexico.

Meanwhile the monetary situation goes on rapidly improving. The gold influx into the Bank of England has become heavier than ever. Floating supplies of cash are being increased by heavy home railway dividend payments.

Broomhall's review of the grain trade in foreign countries gives imports of wheat and flour by Germany for the season ending with July 31 as 101,761,600 bushels and exports of less than 22,656,000 bushels, leaving net imports of 74,105,600 bushels, or 5,000,000 bushels less than was estimated last September. Combining the native crop with net imports, the total available supply for four seasons in quarters of eight bushels each is as follows.

	1912-13.	1911-12.
Native crop	160,240,000	149,416,000
Net imports	73,546,000	58,080,000
Total available	233,786,000	207,496,000
	1910-11.	1909-10.
Native crop	141,416,000	138,016,000
Net imports	70,800,000	75,200,000
Total available	212,216,000	213,216,000

Germany's wheat year of 1912 had a good deal of damaged product, and this is taken to account for large net imports in the year of large native production.

No large supplies have as yet burdened the market from Russia. About the middle of August the Russian situation cleared up considerably, resulting in large arrivals at Odessa and Rostoff, with expectations of good deliveries at Nicolaieff. Similar clearing in Roumania restored threshing operations. In Hungary the rains caught the country near the end of harvesting. Later wet weather interrupted threshing and reduced arrivals. The quality is said to rank high, but the crop will be about 145,256,000 bushels, compared with 173,328,000 bushels in 1912.

Scarcity of labor and the wet condition of fields delayed harvesting in France. Meanwhile threshing has extended, but the progress of quality of grain is irregular, being superior in the west but less satisfatcory in the cenetr.

General rains have fallen in Australia and prospects are again favorable with some exception in South Australia and a district or two in Victoria. In India offerings are freer and somewhat lower. There have been floods in Bengal of a severe character, inflicting damage on native food crops.

Optimism and improvement practically throughout the entire active list of shares are the dominant notes on the Paris Bourse at present. The outlook for a strong and active business season as soon as the August settlement is over and business begins its autumn movement is now so positive as to amount to certainty.

New Haven Developments.

THE New Haven Road seems to be having more than its share of misfortune recently. On top of the reported deficit for the year of $4,630,000 came newsaper account of the rear end collision at North Haven, one of the most disastrous of its kind within recent years. In addition to these unfortunate developments J. Pierpont Morgan and Company have given notice of their intention to end their connection as fiscal agents of the road. This notice, which was made public by the New Haven's Executive Committee, calls attention to the fact that in the existing fiscal agency agreement, it is provided that the arrangement shall continune until the lapse of ninety days after either party shall have given notice to terminate it. It is suggested, however, that it may be terminated at an earlier date if such action should prove agreeable to the New Haven interests.

As briefly stated in the preceding paragraph a preliminary report of the New Haven for the year ended June 30, based on a compilation of the four quarterly statements, shows a deficit for the year of $4,630,000 after payments of $13,552,237 in dividends. This compares with a deficit the previous year of $929,989, and of $1,267,540 in 1911.

Gross earnings were greater, being $68,613,502, as against $64,033,005 in the previous year. Net after outside operation and taxes was $18,310,835, as compared with $10,424,330 in the year before. Charges increased from $17,341,887 to $10,458,402. The surplus available for dividends was $8,022,237, compared with $13,383,551 the year before.

The heaviest loss was in the last quarter ended June 30. The balance for that quarter available for dividends amounted to $5,060,933, a decrease from the previous year of $2,273,856. The stock sold to a new low record yesterday on publication of the year's record, totaling 96¾.

Digitized by Google

This poor showing of the New Haven has led to widespread rumors of a reduction in the dividend rate and has caused a sharp decrease in stock values. Mr. Elliott's recent remark before the stockholders to the effect that in trying to protect the New Haven's future, there might be some disturbances for the present, has been so generally construed to mean that dividends would again be reduced, that he found it advisable to issue the following explanatory statement:

"This remark was not based on results or expectations on the New Haven road alone but on the general situation in the United States. It is a matter of common knowledge that the margin between income and outgo on the American railroad is very narrow, and too small for the best interests of the country, which needs the very best kind of transportation facilities.

"Circumstances sometimes compel changes in dividends. This great Chicago, Burlington and Quincy road at one time had to reduce its rate from 8 to 4 per cent. The Pennsylvania road had to reduce at one time to 5 per cent, and so had the New York Central and Chicago, Milwaukee and St. Paul. Only recently the Chesapeake and Ohio had to reduce its rate and the Big Four had to pass its preferred dividend. The Wabash, Frisco and Pere Marquette roads, all serving important parts of the United States, have not been able to make enough to keep out of court and all are in the hands of receivers.

"The result on the New Haven road for the year ended June 30, 1913, as published in the newspapers, show that the road failed to earn the dividends paid by $4,630,000. There are twenty-seven directors of the road and the decision about dividends rests, of course, with them. I have not discussed this question with them and do not know their views, but it seems obvious that dividends cannot long be paid unless earned and that it is wise to look the situation fairly in the face.

"It is conceivable that a somewhat reduced corn crop in the West, some disturbance in the manufacturing business because of the readjustment of the tariff and some slackening of business generally may produce conditions that will make it necessary or wise to change the dividend rate.

"I most earnestly hope that such conditions will not arise and I have great faith in the future growth of all kinds of business in the United States and New England. I have faith also in the strength and stability of our railroads in the long run, but if earnings decrease to a greater extent than it is possible to reduce expenses, then it would seem to be better to face the issue and consider the ultimate welfare of the property even at the cost of temporary loss and inconvenience.

"Gross earnings have increased since 1910 to the extent of $7,910,834, but at the same time expenses and taxes have increased $8,932,534, so that the net earnings show a decrease of $1,012,690. These figures emphasize some of the difficulties confronting railroad owners and managers at the present time."

The New Haven has filed an amendment with the Massachusetts Public Service Commission broadening the scope of its two earlier petitions for approval to issue $67,552,000 of indebtedness. The amendment omits all limitations and descriptions, and stipulates that $15,000,000 instead of $12,000,000 is wanted for future additions and improvements. It substitutes the words "evidence of indebtedness" for "debenture bonds," and omits several provisions, including rate of interest, and the date of issue, which appeared in the previous petitions. It is reported that a complete examination of the New Haven's finances is to be made by the State Commission before final action is taken on this application. Chairman McLeod asserts that it is the most important undertaking which has ever been before that body.

Railway Earnings.

RAILWAY earnings continue to show two marked characteristics, one an increase in gross and the other an increase in operating expenses, which often is so great as to make net revenue compare unfavorable with the corresponding month of last year. By this comparison the increase in gross of the Baltimore and Ohio for July was $785,000, while the increase in net was but $300,000. On the Erie, the gross increase was over $1,000,000 but the net fell more than $100,000 below that of 1912. On the Lehigh Valley, July's gross indicated an increase of $86,000, while the operating income showed a decrease of $266,000. On the Buffalo, Rochester and Pittsburgh, the gross showed an increase of $179,000, while the net corporate income increased by only $42,000; on the Southern Railway, July's gross fell below that for the corresponding year by $30,000, the decrease in net, however, being over $160,000; on the Mobile and Ohio, the gross improvement was considerably over $100,000 while the net amounted to but $27,000; on the Atchison, the increase in gross was $183,000, and in net $98,000; on the Chicago Great Western, the gross increase amounted to $636,000, and net increase to $19,000; on the Chicago and North Western, July's gross showed a gain of over $600,000 and a net of $20,000; on the Chicago, St. Paul, Minneapolis and Omaha, the gross increase was $142,000, while net declined nearly $6,000; on the Illinois Central, the gross improvement was $260,000 and the net $153,000; on the Colorado and Southern the gross gain was $155,000 and the net $10,000; on the Southern Pacific, gross showed a slight decline of a little over $1,000, while net fell to the extent of nearly $800,000; on the Union Pacific a similar condition was noted, the decline in gross being $4,000 and that of net $671,000.

Annual Report of the Lehigh Valley Railroad.

IN the annual report of the Lehigh Valley Railroad recently made public, President E. B. Thomas states that continued increases in the taxes railroads must pay annually, the steadily advancing cost of labor, and incidentally the new so-called "full crew laws," as well as the important and necessary betterment of the system and the added expense of handling an increased volume of business, are factors causing the advance in the cost of operation during 1913. President Thomas called especial attention to the tax accruals which every year are showing a steady increase and which now amount to 3.74 per cent of the company's gross operating revenue. In the past five years taxes have increased 43.31 per cent whereas the gross operating revenues have increased but 21.21 per cent.

The net revenue of the road for the year was $13,935,552.32 as against $12,185,685.40 last year, an increase of $1,749,880.92. The gross revenue was $43,043,371.89, against $36,905,935.21 for the

Digitized by Google

preceding twelve months, an increase of $6,137,436.68. This was offset, however by the increased cost of operation, the total operating expense amounting to $29,107,819.57 against $24,720,249.81 for the year ending June 30, 1912.

The transportation of coal furnished the chief revenue of the company. The income from the handling of this commodity amounted to $20,385,389.09, an increase of $4,084,072.85 over the preceding year. This increase, however, is something more than a normal one, according to President Thomas, who explains it as having been due to the fact that for eight weeks last year labor difficulties in the anthracite coal fields compelled a complete suspension of business of this sort. The rush following the resumption of business furnished the special increase in business.

The total revenue from coal and merchandise freight carried by the Lehigh was $36,725,138.06, an increase of $5,832,582.26 over last year. A total of 5,518,524 passengers was carried during the year, and from this source the revenue amounted to $4,867,554.03, an increase of $163,820.51.

The preliminary statements of other roads for the fiscal year which are now coming in, possess the same general characteristics of recent monthly statements, that is, they generally show a favorable increase in gross which is often partially or more than offset by a corresponding increase in the cost of operation.

Operation

The New Haven Wreck.

IN accepting the position of chief executive of the New Haven lines, President Howard Elliott has assumed responsibilities which might well have caused a less resourceful man to hesitate. It was on the first day that he actively assumed the office of president that the disastrous wreck occurred in which the Bar Harbor express was rammed by the White Mountain night express near North Haven, Conn., and twenty-one persons killed and fifty injured.

The cause of the disaster has been thoroughly investigated by the Interstate Commerce Commission, by the State authorities of Connecticut and by the Railroad, and while it appears there was unquestionable negligence on the part of the flagman of the train rammed, in not installing precautionary signals at a distance sufficient to insure safety, and on the part of the engineer of the second train in maintaining excessive speed under conditions of fog, it was clearly shown that the banjo signals, still employed by this road to a large extent, are far from satisfactory in developing the same degree of safety as do the semaphore signals now used on a great majority of the country's railroads. The investigation showed that the engineer of the White Mountain express had a clear right of way over the tracks where he was running on the morning of the wreck. The Bar Harbor Express, second section, the train which was wrecked, ran by the banjo signal 23 at North Haven, and thereby tripped the signal which gave Miller the right of way over the three-mile tangent preceding.

This fact was established by the admission of the engineer of the second section of the Bar Harbor Express, who did not hesitate to say that he had run by banjo signal 23. He gave as his reason for this the excessive speed at which he was traveling, and the fact that the fog obscured his view of the banjo signals until he was almost upon them. He said, however, that he had a signal to proceed two minutes after he stopped, but he waited six minutes, believing it was better to give his flagman ample time to protect his rear end, after having tripped the signal.

President Elliott has acted promptly in the matter and has been quick to assert that nothing will be spared to make the system one of the safest in the United States. It is the intention of the present management to have all its sleeping cars of steel before January 1st, if the Pullman Company can furnish them, and rush orders have been sent to other car builders, who now have steel cars for the company under contract, calling for the expenditure of $6,500,000. Orders have also been given to rush work on the new signal system which is to replace the old banjo type.

The wreck has occasioned a vast amount of bitter newspaper criticism, a part of which, unfortunately, has been far from fair. For example, the system's lack of steel car equipment has received the strongest censure, and it has been made to appear that the New Haven was far behind other systems in the employment of such equipment. With but two or three exceptions, however, steel passenger cars are used at present to only a limited extent, and while all roads are desirous of producing a maximum of safety in train operations, steel passenger equipment is a comparatively new development and can only be taken advantage of as the present rolling stock is either worn out or advantageously disposed of in some other manner.

The record of the New Haven road for the past four years is one which has been far from satisfactory, and undoubtedly requires a drastic remedy which it is believed the new chief executive will vigorously apply. An examination of the Company's record for the past ten years, however, shows that for the first six, the road maintained a high degree of immunity from accidents under conditions of road equipment and traffic similar to those existing when the fatal accidents occurred. While this constitutes no reason why every effort should not be made to develop a maximum of safety, it does illustrate how adventitious railway accidents are.

Results of the Tyrone Wreck Investigation.

THE Interstate Commerce Commission has issued a report covering its investigation of the rear end collision which took place between two passenger trains on the Pennsylvania Railroad at Tyrone, Pa., on July 30th. The Commission squarely places the blame upon the shoulders of three men on the locomotive which caused the damage, for failing to observe the signal which had been set against the approaching train.

The accident resulted in the death of one employe and the injury of one hundred and twenty-

Digitized by Google

six passengers, twenty employes, five postal clerks and two Pullman employes.

The trains were being operated under the automatic block system, which was in good working condition. The report says there is no excuse for the failure of all three men to observe the signal.

"A consideration of accidents of this character," says the report, "leads inevitably to the conclusion that even the most complete and modern system of fixed signals is not adequate and calls attention to the necessity of automatic train stopping devices."

The report says that "the substantial construction of the modern steel cars of these trains is, without doubt, the reason that none of the passengers were killed."

British Railway Accidents.

REPORTS to the British Board of Trade by the railways of Great Britain show that in 1912, 1,010 persons were killed by train accidents, and 8,700 injured, as compared with 1,070 killed and 8,345 injured in 1911. Not only was there a smaller number of fatal accidents in the last year than in the preceding, but the record was also encouraging when compared with the average yearly mishaps in the period from 1901 to 1910. In the decade 1.046 persons were killed each year. The average of injured in the ten-year stretch, 7,348 per year, was, however, lower than in either 1912 or 1911.

Of the total killed last year from accidents to trains only nineteen were passengers. Passengers injured in mishaps to trains numbered 683. Ninety passengers were killed from other causes while traveling and 2,146 injured. Of "other persons" there were 2,458 trespassers to meet death, including suicides, and 127 injured, and 69 were killed while crossing the tracks and 32 hurt. In addition to accidents connected with the running of trains and the movement of cars, a large number of mishaps occurred on railroad property, which accounted for the deaths of 107 and injury to 23,920 persons.

Change in Promotion Rules on the New Haven.

THIRTY days' notice has been given the brotherhoods of locomotive engineers and firemen by the New York, New Haven & Hartford for the division of engineers into six grades and the seniority rule governing promotions in service will be abolished. This action may produce a somewhat serious labor situation, as the employes' organizations, through their leaders, are canvassing the general situation and are not likely to give way without a protest.

President Willard Bars Liquor from Private Car.

PRESIDENT DANIEL WILLARD, of the B. & O. Railroad, has banned the use of intoxicating liquors on his private car. No matter what the taste of his guests on tours in his car, no liquor is served. Graps juice is the staple beverage, aside from water, milk, coffee, tea or cocoa. The president aims to set his own total abstinence as an example for all the employes of the road. The road has rules forbidding the drink habit among the men.

Quick Lunch Trains.

THE Pennsylvania Railroad Company is going to make an experiment in the quick-lunch-on-wheels business. A steel passenger car is being fitted up and equipped for service as a quick-lunch car. The company will try it out on trains that do not carry dining cars, believing that it will answer a long-felt need. The car is intended to cater to the wishes and tastes of the traveling public who do not wish an elaborate meal.

Sanitary Inspection of Railway Trains.

REPORTS from Washington state that all sanitary inspectors of public buildings of the office of the Supervising Architect of the Treasury have been detailed to make sanitary inspection of railroad trains throughout the United States. These sanitary reports will be sent to the Public Health Service for action.

In announcing the new orders, Acting Secretary of the Treasury Allen explained that because of the great measure of protection obtained for the entire people through train and steamship sanitation the work is to be extended. The railroads had shown a willingness to co-operate, he said, and to remedy any conditions complained of.

Telephone Dispatching.

AT the recent Western Electric Telephone Specialists' Conference, G. H. Heyer, railway telephone engineer of New York, said:

"There are approximately 285,000 miles of railroads in the United States and Canada. Train movements from 1851 to 1908 were governed by telegraph. The first telephone dispatching was tried in October, 1907. To-day there are some 70,000 miles of railroad operated by telephone. Many large roads are now nearly fully equipped. Among them are the Lackawanna, New York Central Lines, Lehigh Valley and Atchison.

"Forty per cent more work can be done by dispatchers with the telephone. Some roads report a saving on an average of an hour and a half in running time on all freight trains. This amounts to about $14,000 a year for each 150-mile section.

"Trains are being equipped with portable telephones so that the train crews can talk with the dispatcher. Iron box telephones at the sidings speed up the freights and save overtime. On many of the lines all but the through traffic is handled by the telephone."

The Car Movement.

THE latest report of the American Railway Association regarding the car surpluses and shortages in the United States, shows that on August 15th, there was a total surplus of 69,253 cars as against 69,716 cars for August 1st, and 58,623 cars for August 15th, 1912. Compared with the preceding period, there was a decrease in the total surplus of 463 cars, made up as follows: An increase of 3,083 in box, 163 in flat, and a decrease of 517 in coal, and 3,192 in miscellaneous car surplus. The increase in box car surplus is in Groups 1 (New England Lines), 4 (the Virginia and Carolinas), 5 (Kentucky, Tennessee,

Digitized by Google

Mississippi, Alabama, Georgia and Florida), 6 (Iowa, Illinois, Wisconsin and Minnesota), 8 (Kansas, Colorado, Oklahoma, Missouri and Arkansas), 10 (Washington, Oregon, Idaho, California, Nevada and Arizona), and 11 (Canadian Lines). The increase in flat car surplus is in Groups 2 (New York, New Jersey, Delaware, Maryland and Eastern Pennsylvania), 4 (as above), 7 (Montana, Wyoming, Nebraska and the Dakotas), 9 (Texas, Louisiana and New Mexico), 10 and 11 (as above). The decrease in coal car surplus was in all groups, except 2, 7 and 9. The decrease in miscellaneous car surplus is in all groups, except 2, 7 and 10.

As for shortages, the record for August 15th, 1913, was 14,828 cars for August 1st, 11,261 cars and for August 15th, 1912, 14,722 cars. Compared with the preceding period there was an increase in the total shortage of 3,567 cars, of which 127 is in box, 414 in flat, 3,009 in coal and 17 in miscellaneous car shortage. The increase in box car shortage is in all groups, except 7, 8 and 9. The increase in flat car shortage is in Groups 2 and 3 (Ohio, Indiana, Michigan and Western Pennsylvania), 4, 5 and 6. The increase in coal car shortage is in all groups, except 6 and 9. The increase in miscellaneous car shortage is in Groups 1, 3, 5, 6, 10 and 11.

Compared with the same date of 1912 there is an increase in the total surplus of 10,630 cars, of which 8,197 is in box, 650 in flat, 3,148 in miscellaneous, and a decrease of 1,365 in coal car surplus. There is an increase in the total shortage of 106 cars, made up as follows: An increase of 2,335 in coal, and a decrease of 697 in box, 812 in flat and 720 in miscellaneous car shortage.

Darius Miller on the Car Situation.

IN reply to an editorial assertion in a Chicago newspaper that the annual car shortage is a puzzle Darius Miller, president of the Burlington system, said:

"There is nothing mysterious about alleged car shortages, as a matter of fact there has not been for several years any real shortage in the number of cars needed at any time. The trouble is that cars are not kept moving. This is caused by unnecessary delays in loading and unloading shipments, and by some smaller roads in detaining for their own use cars of other systems, but it is not always the smaller roads that are guilty of this so-called 'car steal.'

"Another factor is the way goods are marketed, particularly grain. During July, much of the grain of the entire country served by the Burlington road was sent to market. In July of last year, we loaded 8,682 cars with grain while for the month just closed we loaded 15,100 cars. All of the growers of grain apparently wanted their product to market during the one month and such unusual concentration would cause a car shortage on most any road. If all business were concentrated in this way in a brief period there would never be cars enough made to answer the condition. And this is a condition we cannot control.

"Barring this unusual concentration of traffic offerings, which do not occur often, there is comparatively little complaint. If all of the cars in the country were promptly handled by railroads, shippers, and everybody having to do with traffic, there would be no shortage; there are enough cars. The real trouble is not mechanical but human, that is, lack of co-operation. Last year the Interstate Commerce Commission, recognizing that the railroads were not the only factors in alleged car shortages, urged the shippers of the country to help keep the nation's business moving by prompt loading and unloading of their goods, releasing cars quickly to railroads and to keep them moving. The railroad commissions of California, Illinois, Oregon, Washington and other States gave similar assistance. Shippers are coming to realize this condition and are responding by putting their shoulders to the wheels of co-operation. For several years railroads have been buying equipment as fast as it could be manufactured, and careful statisticians say the total number of cars if kept moving would take care of all business. With co-operation among railroads, shippers, public authorities and the press, car shortages would be practically unknown."

Safety on the New York Central.

THE New York Central Lines continue to give increasing attention to the question of safety. The latest issue of their enterprising magazine on this subject shows improvement both as to subject matter and illustrations, and is replete with information tending to help employes develop a more consistent and effectual safety habit.

That the efforts of the company have borne a satisfactory fruitage is indicated by the fact that on the New York Central road a total of eighteen fewer employes were killed on duty during the first four months of 1913, than during a similar period in 1912, indicating a decrease of 31 per cent in the casualty record; while there was a total of eighty-eight fewer employes injured by a like comparison, or a decrease of 12 per cent. This record becomes more significant when it is understood that the decrease in injuries which it represents, was made despite a considerable increase in business transacted. On the Lake Shore and Michigan Southern Railway even a greater improvement is noted.

Two photographs are presented herewith illustrating the interior of the New York Central Lines safety equipment car. This car was put into commission on July 30, and is being sent over the entire system for all employes to inspect. It contains a large number of models showing how machinery should be safeguarded, with photographs illustrating the right and wrong way of performing work. On the first two days that the car was opened it was visited by 600 men. Lectures are given in another special car accompanying the exhibit.

The exhibit car was constructed from a standard baggage car, is finished in white enamel, and has a floor covering of linoleum. Along both sides, about three feet from the floor, is a shelf which is finished in mahogany, and on which the various models are placed. On the side walls, a couple of feet above the shelf, is a double row of neatly arranged photographs. On one side of the car are a number of photographs which show unsafe practices which commonly cause accidents resulting in injuries to the employes and others. Alongside of each picture is another one showing the safe practice which if it had been followed would have prevented the accident. This collection of photos is based on those causes which statistics covering the past two years show to have been the most prolific sources of accidents.

The models which are shown cover safeguards to shop machinery and also include water gauge glasses of an approved and safe type, and models showing the proper way of applying railings to engine house turntables and to transfer tables; also of safeguarding stairways. There are a number of signs in the car which are intended to catch the visitor's eye and emphasize certain facts in connection with safety first. Among these are the following:

"It pays to do your work the safe way."

"The most important machine is man. Get the safety habit."

"Thirteen thousand miles of railroads—150,000 employes. We aim to make them all safe."

"Statistics show that by far the greater number of injuries are caused by unsafe practices on the part of employes."

The following illustrations of defective tools shows the manner in which the New York Central Lines are calling their employes attention to the danger connected with the use of such tools. Attention is called to the fact that tools in this condition should never be used, and that hundreds of shopmen have been injured because of their neglect in making reports regarding defective implements.

Another photograph, herewith produced, strikingly illustrates the protective effectiveness of goggles worn by employes in the performance of certain classes of work. The cracks and breaks in these goggles show where hard material has hit

them with such force as to probably have destroyed the sight of the man wearing them, had his eyes been unprotected at the time. In referring to this illustration the safety committee calls attention to the fact that dozens of other pairs of broken goggles could be shown in the same condition if space permitted. These goggles are now supplied chippers and grinders in shops to reduce eye injuries, and the company urges men engaged in this work to avail themselves of the protection afforded by the glasses, which are furnished free of charge. The necessity for their use is evidenced by a statement that on a single line of the New York Central system last year, there were more than 500 cases of eye injuries to shopmen.

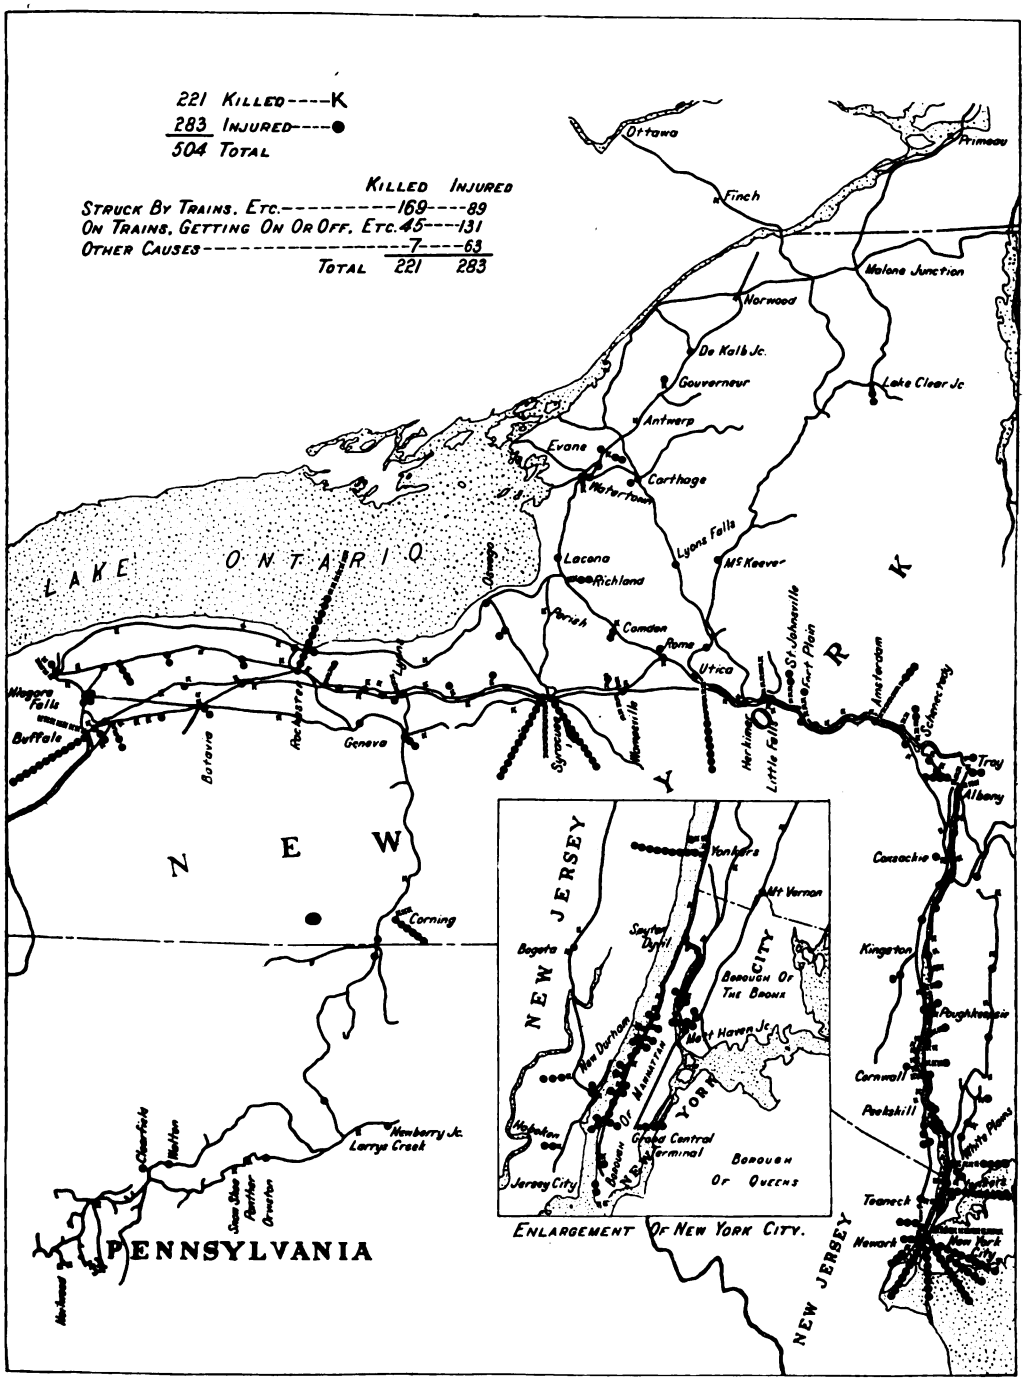
Trespassing Casualties on the New York Central.

THE following chart, prepared by Frank V. Whiting, general claims attorney of the New York Central Lines, graphically illustrates the injuries to trespassers during the calendar year 1912.

The New York Central has been making a strong effort to prevent accidents to trespassers, but the results have not been highly encouraging owing to the lack of co-operation on the part of local authorities. The worst feature of the trespassing evil is that the majority of those injured or killed, are not of the tramp or hobo variety



LOCATION OF ACCIDENTS TO TRESPASSERS ON THE NEW YORK CENTRAL AND HUDSON RIVER RAILROAD DURING THE CALENDAR YEAR 1912.

Digitized by Google

as is commonly supposed, but are in many instances, regularly employed and well-to-do respected citizens. Thus the problem may be seen to be a local one, and one in which local authorities should take an active interest.

Up to the present time, however, it appears largely impossible to have magistrates deal with this question in such a way as to discourage further trespassing. Other roads besides the New York Central are giving this matter increasing attention, and it is to be hoped that public officials will show a livelier appreciation of their responsibility by a more active and effective co-operation. Surely with so much criticism against railway casualties, much of it emanating from official sources, those in authority should be more than willing to employ every means by which a greater part of such casualties can be avoided.

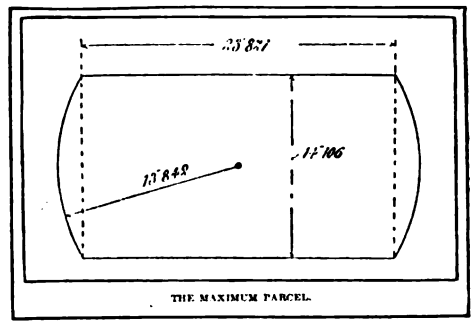
Maximum Parcel Size Under the Parcel Post.

IN discussing the maximum size of a package which may be carried under the parcel post regulations, Naval Instructor D. W. Taylor, writing to the *Scientific American*, has the following to say:

"If we have a rectangular package and take as its length the perpendicular distance between the planes of the ends, we are using for the length not the 'greatest' distance in a straight line between two ends, but the 'least' distance between the two ends. The greatest distance in a straight line between the two ends of a rectangular package is obviously the diagnoal of the solid.

"In this case the largest rectangular package that can be accepted under the literal wording of the parcel-post regulations is, using dimensions to three decimal places, 10.286 inches square and 27.214 inches long on an edge; the diagonal being 30.857 inches. Such a package will contain 2,879 cubic inches only.

"The very largest volume that can be accepted for parcel-post transmission under the regulations will be a cylinder with spherical ends, as indicated in the enclosed sketch, which gives an axial section of the solid.

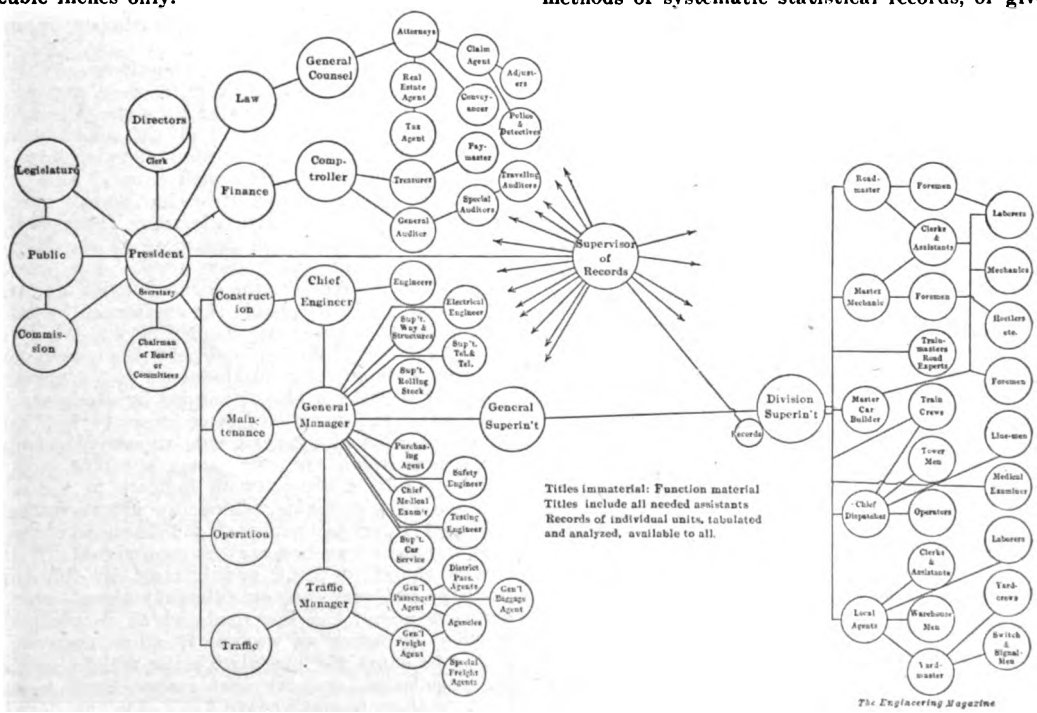


THE MAXIMUM PARCEL.

"The diameter of the cylinder will be, to the third decimal place, 14.106 inches, and the length of the side, to the third decimal place, will be 23.821 inches, the cubical contents being 4,032.19 inches."

Standardizing Railroad Records.

IN the *Engineering Magazine* for August, Mr. F. Lincoln Hutchins discusses a practical plan for standardizing railroad records. He points out that the only criterion of efficient management, is transportation produced with the least expenditure of power or productive effort, and that such results cannot be obtained without systematic railroad records to be used as a basis for corrective effort. While the roads all have an overwhelming abundance of reports, there is scarcely one, he asserts, that complies with the methods of systematic statistical records, or gives



SUGGESTED SCHEME OF ORGANIZATION FOR STANDARDIZATION OF RAILWAY RECORDS

From the "Engineering Magazine."

Digitized by Google

a true indication of the operation it is supposed to represent. He points out that the purpose of systematic records is to clearly bring out all evidences of waste so that correct methods might be applied. This necessitates standards, which may be theoretically established by evolving the typical cases of operation based upon potential possibilities.

Mr. Hutchins believes that the remedy for wasteful methods is to be found in the establishment of a systematic record bureau which will be able to place on the managerial desk from day to day, a current record of all operations, with a statement of the waste incurred. He believes that the manager having a daily, weekly or even monthly comparison of all divisions, each with respect to its own past performance, arranged upon the twelve month average plan (whereby all climatic and seasonable trade elements would be equalized) will have a larger understanding of the operation, a better knowledge of the comparative efficiency of his division officials, and a more perfect means of control, than any amount of personal observation could give him

He believes railroads are peculiarly adapted to develop the required records and that the first necessity is to divorce records of operation from financial records and that it is important the parties who are to be judged by the records, should not have control of them or their compilation. The present universally pursued plan of departmental records under the control of the departments themselves, leads, he asserts, to duplications, misapplied units and confusion in final results.

The absence of any definite plan in the organization for a record bureau, is one of the obstacles to the adoption of a scientific plant by which unit records may be obtained, tabulated and analyzed, and Mr. Hutchins suggests that a scheme of organization as outlined in the following diagram, would make it possible so to co-ordinate and handle records as to make it well nigh impossible to ask any questions regarding operations, which the record bureau could not immediately answer from its accumulated units without necessitating special reports and inquiries.

Railway Signalling on the Pennsylvania Railroad.

IN an address before the Railway Club of Pittsburgh, Mr. A. H. Rudd, signal engineer of the Pennsylvania Railroad, discussed at length, the new system of signals which have been put in operation on this great system. In view of the high standard of safety in train operations on the Pennsylvania, Mr. Rudd's description is of more than ordinary interest. He said, in part:

"We have started a new system with certain fundamental principles, the first of which is that a signal imperfectly displayed or the absence of a signal at a place where a signal is usually shown, must be regarded as the most restrictive indication that can be given by that signal. We have tried to design the signal so that if it is imperfectly displayed it will show in itself that it is not properly displayed. I will explain that a little later.

The second principle is that a red light or arm horizontal indicates stop unless qualified by a more favorable color or angle of arm. When this scheme was first proposed there was a great deal of opposition to it because it required an engineman to run past a red light in almost every case —in every case, in fact, where a signal indicated a clear block with one exception. It had been done for years with interlocking signals, but we had not done it with automatics and it was thought probably a bad thing to extend the use of the red light to the automatic signals. I think results have proved that it is not much of a mistake. Remember, then, that a red light means stop, unless qualified by a more favorable color indication.

Third: A given aspect conveys the same information at all places, at all times and under all conditions, so that an engineman knowing the physical characteristics of his road and the location of his signals may always be sure that he is obtaining the same information with the same signal aspect.

Fourth: The signal must indicate where and when trains must stop and the action to be taken after stopping—whether or not it indicates the condition of the block and, if it does, whether the block is occupied or clear. It must indicate when to prepare to stop or slow down and how fast trains may run under the changeable conditions at interlockings. It must show in itself when it is properly displayed.

Fifth: This information is all that is needed as to conditions ahead to enable an engineman to run safely, confidently and expeditiously if he obey the indications.

To give this information the signals are divided into four classes—stop, caution, proceed and permissive. The stop signals are all red. The proceed signals show a white light in combination with red or green. The caution signals show a green light in combination with a red. And the permissive signal shows two horizontal green lights in combination with the red. The permissive signal is probably needed more on the Pennsylvania than on any other road. The great majority of the roads of the country under manual block issue a card to enable the engineman to pass a stop signal to enter an occupied block. We give a signal for it. We do not permit a passenger train to enter an occupied block; we do not permit a freight to enter a block occupied by a passenger train; and this practice has been pretty well extended, so that as a general rule on some divisions preference freight is run under absolute block. We have felt it necessary to indicate to the enginemen of fast trains, which are not permitted to accept a permissive signal, a difference between that signal and an ordinary caution signal. It is a stop signal to them, and it must be different from the ordinary caution (distant) signal, which they can accept. A few roads which do use permissive operation as we use it allow passenger trains to enter the block with the freight under the permissive, and for that reason there is no need for them to make any difference in the signal.

Digitized by Google

Stop signals are divided into two classes, stop and proceed, and stop and stay. Stop and proceed signals are the ordinary automatics to be passed as per Rule 504, looking out for a train in the block, switch open, broken rail, etc. These are identified by the staggered lights, diagonal lights, with pointed arms. The pointed arm may not be necessary, but the New York Central has used it a long time. In order to get a system which would be uniform on the Pennsylvania and the New York Central and some of the other roads which operate with us jointly we adopted the pointed arm.

The stop and stay signals have vertical lights, either two or three, with square or round end arm, so that when an engineman comes to a signal with a pointed arm at stop he can stop and proceed; if he comes to another with a square or round end arm he knows he must stop until he receives further instructions.

Caution signals are divided into two classes. First, those indicating one block clear, the next signal stop; second, those indicating the position of the next signal, but also indicating that they give no information as to the occupancy of the block. In automatic blocks a clear signal indicates that the track is clear to the next home and that the next home is clear. In manual block territory under permissive operation you might have a clear distant, but there might be a train between the distant and the home. So that we have added the fishtail arm with vertical green lights. These signals are distant signals purely and never go to stop and never indicate the position of the block, and therefore they do not show a red light. The rule is that a signal imperfectly displayed or the absence of a signal must be regarded as the most restrictive indication that can be given by that signal. Now if the active light goes out and this signal is a stop signal, the most restrictive indication is stop. Therefore we display a red light with the active light out. With the distant signal the most restrictive indication is caution; therefore we show a green light if the active light is out, so that the signal in itself shows what its most restrictive indication is.

Permissive signals indicate positively to a man that the block is occupied. The clear signals indicate clear track, except the clear fishtail distant, which does not indicate anything about the track.

Now clear signals may govern, and do govern, the speed at which trains may pass an interlocking. The top arm is the top speed, the bottom arm is the bottom speed, and the middle arm is the middle speed. In practice the top arm clear governs the authorized speed at that point, the bottom arm clear not to exceed 15 miles an hour, and the middle arm clear not to exceed 30 miles an hour. The old scheme of signaling routes has been abandoned, and we have come to what may be known as speed signals at interlocking, where conditions change on account of the changed position of switches. We do not attempt to signal speed out on the road, where the curvature is fixed and the grades and the stations, etc., are established. But where the conditions change at interlocking we signal the speed.

(Note diagram on preceeding page.)

The indication "Proceed at slow speed" is given for movements not exceeding 15 miles an hour with traffic when next signal is clear. An aspect with the bottom arm at 45 degrees is what we call the "know nothing" signal, or anything you please. Proceed with extra caution prepared to stop. It may govern to an occupied track, it may govern against traffic over a short crossover; at any rate, it indicates that you may pass the stop signal above it, which governs the through movement, but you must look out for yourself.

The dwarf signals govern the same way as low-speed signals—stop; proceed with caution, looking out for anything ahead; and proceed with traffic, your next signal is clear.

The fishtail signals do not indicate the condition of the block.

You will notice that they are all consistent, they all display a red light in combination with others, where they indicate block conditions, except the one with the green over white, and that bothers more people than anything else in the signal business. It is a poor aspect, it is inconsistent. But it is the best we can get. It is a pretty valuable signal on the P. R. R. The Lines West do not use it; they claim they do not need to use it. A great many others do not. The Pennsylvania does and the New York Central does, and I believe the B. and O. does.

This system as it stands I believe will remain unchanged on the Pennsylvania Railroad for a considerable time. Experience has shown that it is all we need, except for some few changes which I hope they will let us make. We have adopted a purple light to show the siding derail open. Some years ago the General Manager issued instructions that switch lights on sidings and in yards should not be red, that they were liable to confuse the main line runners; and that left us when we came to study it only one color to use for derails, and that was purple. It is a short-range light, similar to red, and yet it cannot be mistaken for it. We still have the red for the dwarf signal light next to the main track, governing movements against traffic on the main track and to the main track from sidings and yards. I hope some time to see these changed to purple, removing all low red lights except on main line switches.

And I have another "hobby," and that is green for clear and yellow for caution. A good many railroads in the country have adopted it, and to my mind it has very decided advantages over the present practice. That is where we have a white light in our diagrams, substitute green, and where we have a green light substitute yellow, making in that case the yard lights yellow and lunar white and the main line switch lights red and green, so there will be no confusion to main line runners with any siding switch light.

Our Lines West and a good many of the western roads omit the middle arm and just have two arms, using the top arm as shown in these drawings, and the second arm at 45 degrees for low speed and vertical for medium speed. I do not see how any road that still has a home and distant signal can adopt that, because the home and distant signals show red and green, and that would mean the same as proceed at low speed. The green light in the stop signal must be eliminated before any road can adopt the simplified two-light system all the way through. But that is ideal, to have two lights and never less than two. Then if an engineman comes to a one-light signal he knows it is improperly displayed. At present with us he knows that if he gets one light on a signal it is improperly displayed. All the automatics have two lights, all the distant signals and manual blocks have two lights, and at certain interlockings he has three, and the fact that there are three there is shown him by the display of two arms on the distant signal, so when he comes to a two-arm distant signal he knows the next signal is a three-light signal. It helps the engineman to determine whether he has a light out at the home, and when the system is well learned there will not be very many enginemen running by signals because there is a light out.

We also have slow and stop boards and track tank signs showing lunar white and green. Then we have the coon tail. The coon tail is a very valuable adjunct to a coon. It is a very valuable adjunct to us in spots. We issue instructions that a man should slow down and then we put a coon tail up to show him where he should slow down. It is quite a good deal of assistance in marking slow points along the road.

As to the means taken to insure the accuracy of the indications, we are installing all our new automatic work with alternating current track circuits, because we find that power and current from trolley road lines interferes with our direct current track circuits. There are precautionary measures that can be taken with D. C. circuits, such as double relays and cutting circuits up, which have been tried with fair success. The real cure for the foreign current is the A. C. track circuit, and we are not only installing all new work that way, but changing over some of the old. This carries with it electric lights on the signal and A. C. motors.

The cost of installation is heavy. It runs for double track about $3,000 per block, 4,000 or 5,000 or 6,000 feet long; for the two tracks probably $8,000 a mile. I suppose some of the expense end of that will come out of the 5 per cent. advance in rates!

Operating and maintenance costs are below anything we have had. The electro-pneumatic signal runs about $160 a year per block. That on a four-track road is $640 a mile. The D. C. motor runs about $90, and in some fortunate cases we have had $75 quoted, but we are from Missouri. The A. C. runs not over $60. This means a saving of $400 a mile over the old electro-pneumatic. While it is more expensive than the D. C. motor, when the difference in cost of installation is considered, we think it is safer.

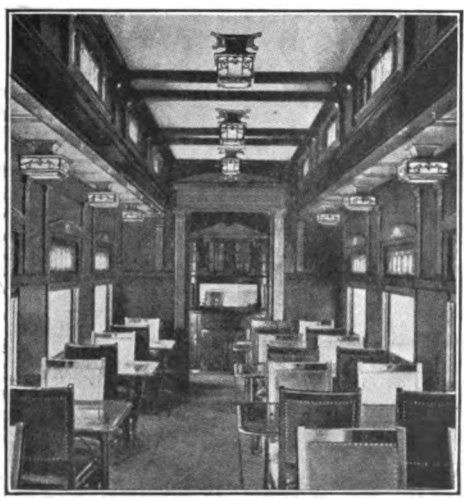
Mechanical

The Illumination of a Modern Passenger Car.

IN an article by Mr. L. Schepmoes, appearing in the "Safety Heating and Lighting News," the practical side of illuminating engineering on railway cars, is dealt with at length. Mr. Schepmoes holds that the value of psychology in the study of illuminating engineering, must not be entirely ignored. As an illustration we invariably find the point of most brilliant illumination in a room produces the greatest attraction to the eye. If the dining table is brilliantly illuminated, we are instinctively drawn to notice it; but even with a dainty service and a fresh arrangement of flowers, the effect is lost if the illumination is so arranged as to direct a maximum light on the wall, or other part of the room, away from the dining table. It is, therefore, important that the lighting of a dining car be so arranged as to make the dining table the center of composition and the most attractive part of the room.

After discussing the various methods by which this can be best accomplished, and in which indirect lighting, table lamps and bracket fixtures are disregarded as being either inadequate or containing no particular advantage, Mr. Schepmoes arrives at the conclusion that the most satisfactory method used to illuminate dining cars is the one wherein the reflector-plate type of fixtures are mounted under the side decks over each table. A large number of cars are now equipped with this type of fixture and give very good satisfaction. The illustration shows a dining car equipped with one form of this type of fixture. The light source is entirely screened from the vision of the occupant of the dining table chair. When we say "entirely screened" we mean that all active light is screened from the vision although colored art glass is employed at the sides of the fixture to give a slight color effect to the fixture as well as adding to the cheerful appearance of the car.

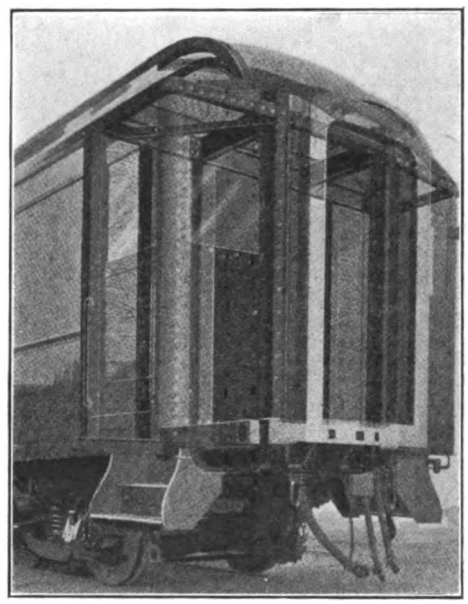
I am convinced that no better illumination on the dining tables of a railway dining car can be obtained with any other method. The advantages of this method of illumination by reflector-plate units is due to the absolute control of the light rays, by re-directing the maximum flux of light from the lamp downward on to the dining table, producing an even illumination over the entire top of the dining table.



DINING CAR EQUIPPED WITH REFLECTOR-PLATE FIXTURES LOCATED OVER DINING TABLES, AND BOX TYPE FIXTURES IN CENTER DECK.

New End Construction for Pullman Cars.

THE Pullman Company has recently developed a much more substantial end car construction for both wooden and steel equipment, which, it is believed, will better withstand the shearing effect that a heavy steel underframe of one car has upon the superstructure of another, when this underframe laps over that of the car ahead in a collision. The accompanying illustration gives an idea of the method involved.



THE PULLMAN COMPANY'S NEW END CONSTRUCTION FOR BOTH STEEL AND WOODEN CARS.

The principal feature of this new design, which is the invention of Richard Deam, general manager of the Pullman Company, is that of an I-beam bent in the form of a "U," the legs of which extend upward from apertures in the platform casting. Two of these U-shaped I-beams are applied to each end of the car in the manner shown, one leg forming the door post at the entrance of the car, while the other forms the door post for the opening between the cars at the platform end sills. The U-shaped members are made from one continuous I-beam instead of being made up of riveted sections, in order to eliminate any possibility of riveted joints failing. With this construction it is readily seen that in case of collision, should one underframe override that of the next car, its progress will first be obstructed by the legs of the U-beam at the bumper sill, which as they bend will tend to lift the whole car body, thereby offering greater resist-

Digitized by Google

ance to further advance of the overriding car. If these should fail there would still be the second leg of the U-shaped member, together with the strengthened car end, to further retard the progress of the overriding underframe.

FIRE FIGHTING CARS ON THE CANADIAN PACIFIC.

THE Canadian Pacific has recently constructed two tank cars specially equipped for fire-fighting. Apart from the end arrangement of the auxiliary equipment, they are identical in construction. Each car carries a tank of 8,428 gallons capacity, and on the end of one car is a duplex fire pump using steam from the locomotive boiler and on the corresponding end of the other car, a rack construction on which can be carried 6,000 feet of 2½-inch fire hose. As indicated by this equipment, the cars are to be operated together.

In both tanks the suction is through a 3-inch pipe near the bottom and to one side of the center line forming a U-bend, the open end of which drops down to within an inch of the bottom of the tank. The suction pipe, from the point it leaves the tank, passes along the side of the tank on the deck to the open platform end. In the rack, this terminates in a cap end, to which can be connected a short section of 6-inch rubber hose supplied with the car for connecting up with the pump car, in which pump car the connections are somewhat similar with a capped end pipe, but this short length of pipe from the tank to the capped end, contains a 6-inch "T" connection to the pumps. In both cars the connecting length has a globe valve.

FIRE-FIGHTING TANK CARS, THE FIRST EQUIPPED WITH HOSE RACK AND THE SECOND WITH DUPLEX PUMP.

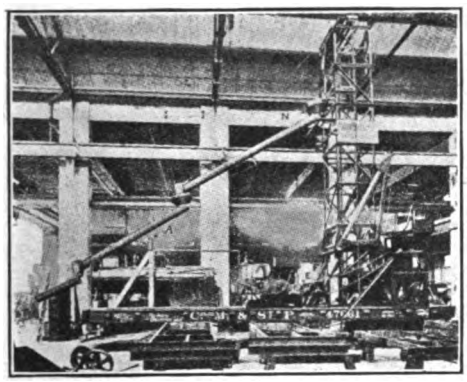
A Portable Railway Concrete Plant.

ENGINEERING AND CONTRACTING, contains an interesting account of a portable railway concrete span recently constructed by the St. Paul Railway, for use in elevating its tracks along a stretch of 2.4 miles in Chicago. In the promotion of this work, the retaining walls proper are built independent of the footing construction and any time afterward, with an entirely separate plant.

The forms are constructed in a central yard and are shipped on flat cars to the work. A locomotive crane on the track handles the form panels.

In the concreting of the walls, however, the employment of a car-mounted chuting tower and mixer was put into service and constituted the special plant feature of the work, as shown in the illustration. It consists of a mixer and steel hoisting tower mounted at one end of a 40-foot flat car on which, at the opposite end, is a boiler,

Digitized by Google



THE ST. PAUL ROAD'S PORTABLE CONCRETE PLANT, SHOWING CHUTING TOWER AND MIXER READY FOR USE.

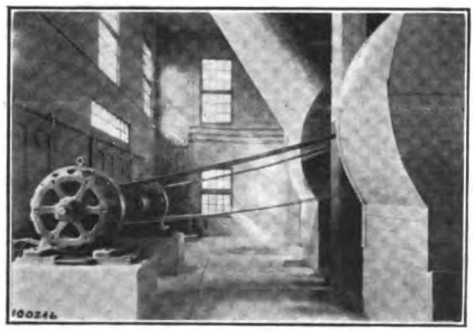
and between boiler and tower an engine. The tower is hinged 6½ feet above the car floor and the upper part can be tipped down onto a support "A" above the boiler, so that its extension above the car floor is only 11½ feet. The mixer is arranged to discharge into a bucket "B" at the tower foot and this bucket is hoisted and empties into a hopper "N," from which chutes lead to the wall forms. The total height above rail of the tower erect is 36 feet and when the tower is lowered the clearance required above rail is 16 feet.

Pre-Cooling Refrigerator Fruit Cars.

FOR some time Pacific Coast railroads, which are engaged in the transportation of perishable fruits over long distances, have found it highly desirable to pre-cool the fruit before starting it upon its extended journey. More recently it has been determined that the pre-cooling of the cars themselves in which the fruit is transported, assists greatly in their preservation and operates as an economy in connection with the quantity of ice employed in refrigerating the cars.

The following illustration shows one of two sets of two 7-foot Sirocco blowers driven by 75-H. P. Westinghouse motors which are used by the Pacific Fruit Express Co., Roseville, Cal., for pre-cooling fruit cars previous to filling their refrigerators with ice.

Air is drawn from cooling rooms, in which the temperature is kept at about 18 degrees F. by direct expansion ammonia coils, and is forced into the cars, thus reducing their temperature.

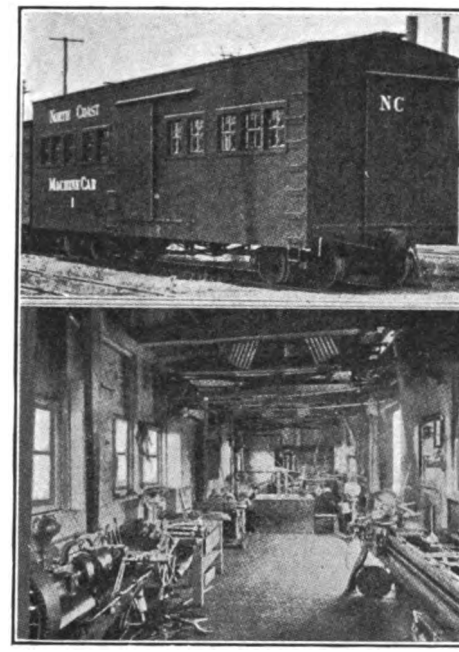


BLOWERS USED FOR PRE-COOLING FRUIT CARS.

By means of specially designed valves, also driven by Westinghouse motors, the air current can be reversed so that the fans can exhaust foul air from the cars previous to pre-cooling.

Machine Cars for Construction Work.

THE utilization of reconstructed or specially constructed cars to aid in the development of various railway operations, is on the increase. Not only are cars used for instruction purposes, such as those in which farming and dairy displays are made, and more recently for the purpose of safety appliance exhibits, but there appears a growing tendency to employ such cars, wherever possible, in the actual performance of railway work. In this connection, a machine car recently built by the North Coast lines in Washington, is an example. The car provides repair shop facilities for general use in connection with the laying of new track or other construction work, remote from such facilities.



EXTERIOR AND INTERIOR OF MACHINE CAR OF THE NORTH COAST LINE.

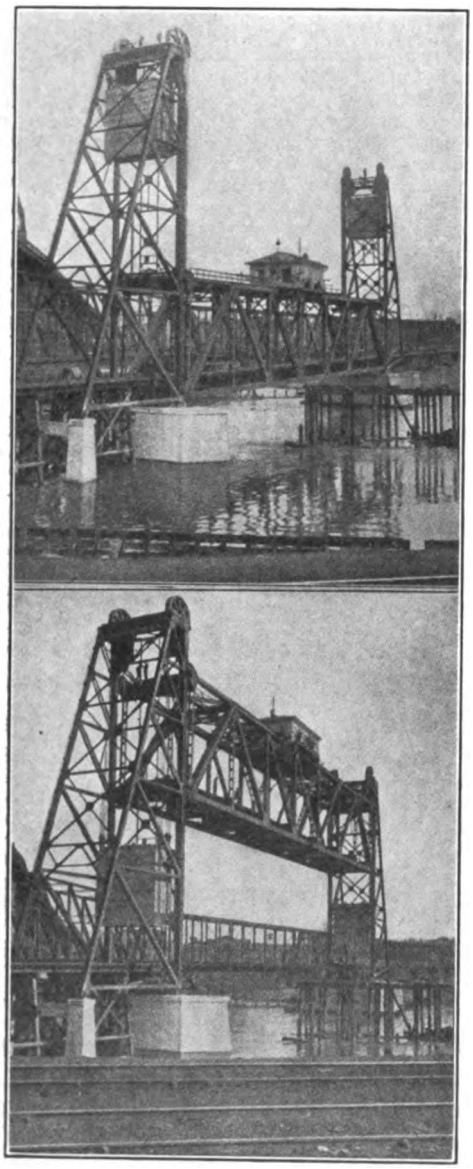
The accompanying illustrations give some idea of both its exterior and interior appearance. The equipment includes an old-cooled vertical gasoline engine, which is connected to a friction clutch and to the wheels of the car by sprockets and chain, making the car self-propelling, and permitting it to be moved from one station to another under its own power. The tool equipment is of such a character as to permit practically all kinds of repair work incident to track laying and ballasting operations.

New Mississippi River Bridge at St. Paul, Minn.

THE new Mississippi River bridge recently put in operation by the Great Western Railway at St. Paul, Minn., consists of

Digitized by Google

seven 79-foot deck plate girder spans; one 192-foot vertical lift span which will give a clear height of 55 feet above water; 170 feet of temporary trestle on the south end and 220 feet of temporary trestle on the north end, which is on a ten degree curve.



NEW MISSISSIPPI RIVER BRIDGE AT ST. PAUL, MINN., SHOWING THE NORMAL AND RAISED POSITIONS OF THE LIFT SPAN.

The new bridge replaces an old 412-foot draw span and three 225-foot through tress spans, all built in 1885 and reinforced in 1901, which on account of their light design and the increased weight of rolling stock, had to be replaced with a stronger structure. The accompanying photographs show the lift span in its normal and raised positions.

A Novel Extension Car Step.

THE following illustrations show the Crofut extension car step invented by U. E. Crofut, of Scranton, Pa. An important safety feature of this contrivance is that it can never be put down while the train is in motion or before the train has stopped. Another advantage lies in the fact that the step cannot be made to stay down when the trap door is closed, as the trap door is seated on a latch when closed allowing the step to automatically go up under the lower step on the car, and thus making it necessary for the train to be stopped before the trainman can reach the ground and operate lever on side of step. On account of the spring tension which is compressed to put the step down, the step would automatically remain up if the spring became inoperative.

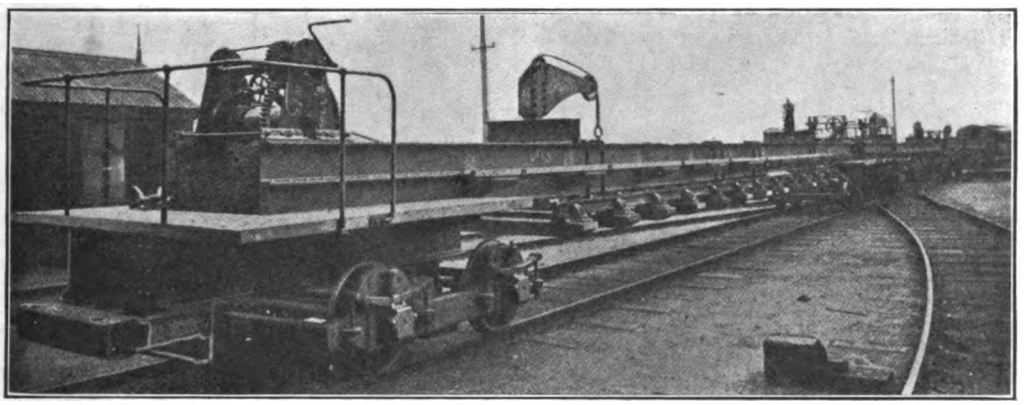
HAULING THE KEEL OF AN OCEAN LINER.

"CURRENT MECHANICS" presents the following interesting picture of an English railroad hauling the keel of a new 50,000 ton ocean liner. The carriage of such material constitutes one of the big problems facing British railway operations, as the steel parts of such vessels are made inland, while the actual construction work is done on the coast. In the accompanying picture, a specially constructed flat car in which the steel is really a part of the car is shown. It will also be noted that two cars with hoisting apparatus are also in attendance for the purpose of removing the keel at the end of its journey.



SPECIAL STEEL CAR CONSTRUCTED IN GREAT BRITAIN TO CARRY THE KEEL OF THE 50,000-TON STEAMER AQUITANIA.

Steel and Steel Underframe Passenger Equipment.

THE Special Committee on Relation of Railway Operation to Legislation, has issued a bulletin which covers, in a brief way, the development which has occurred in the employment by railways since 1909, of steel and steel underframe passenger equipment. The bulletin states that:

Four bills are pending in Congress requiring the replacement of wooden passenger equipment in steel. The periods suggested during which this is to be done, vary from January 1, 1915, to January 1, 1918.

In order to ascertain the progress of the building of steel and steel underframe passenger equipment, and to develop the cost of reconstruction in steel of the present wooden passenger equipment in the country, Circular No. 40 was issued to the railways on January 10, 1913.

Replies to that circular have been received from 247 companies, operating 227,754 miles in the United States, and 57,493 passenger equipment vehicles, with 1,649 under construction on January 1, 1913.

Replies have also been received from eleven companies, operating 24,718 miles in Canada, and 4,891 passenger equipment vehicles, with 517 under construction on the same date.

The estimates and percentages given hereafter apply only to the equipment operated by roads in the United States.

Attention is called to the following:

ACQUIRED.

	Total Number.	Percentages. Steel.	Steel Under Frame.	Wood.
1909	1,880	26.0%	22.6%	51.4%
1910	3,638	55.4	14.8	29.8
1911	3,756	59.0	20.3	20.7
1912	2,660	68.7	20.9	10.4
January, 1913 (Under construction)	1,649	85.2	11.5	3.3

Between January 1, 1913, and July 1, 1913, orders have been placed by railways for 1,140 passenger equipment vehicles. Of these 1,064, or 93.3 per cent, are of all steel construction, and 76, or 6.7 per cent, have steel underframes.

It will, therefore, be noted that the construction of wooden passenger equipment has practically ceased.

APPROXIMATELY IN SERVICE.

	Steel.	Steel Underframe.
January 1, 1909	629	673
January 1, 1910	1,117	1,098
January 1, 1911	3,133	1,636
January 1, 1912	5,347	2,399
January 1, 1913	7,271	3,296
Increase 1913 over 1909	6,642	2,623
Increase 1913 over 1909	1,055%	389%

APPROXIMATE COST OF REPLACEMENT.

	Number.	Average Cost.	Amount.
Postal	680	$11,000	$7,480,000
Mail and Baggage	2,724	10,000	27,240,000
Mail, Baggage and Passenger	679	10,000	6,790,000
Baggage and Passenger.	3,757	10,000	37,570,000
Baggage or Express	7,431	8,500	63,163,500
Passenger	23,692	12,800	303,257,600
Parlor, Sleeping, Dining	6,864	22,000	151,008,000
Business	774	15,000	11,610,000
Motor	325	20,000	6,500,000
Total	46,926		$614,619,100
Annual Int. charge at 5%			30,730,955

The charge to operating expenses under the classification of accounts of the Interstate Commerce Commission, assuming a value of $4,000 per vehicle replaced, will be $187,704,000.

Engineering Department of the University of Illinois Reports on Broken Rail.

THE railway engineering department of the University of Illinois, has recently made a report analysis on a broken rail from

Digitized by Google

the Terminal Railroad Association of St. Louis for the Railroad and Warehouse Commission of Illinois.

The rail was of 80-lb. A. S. C. E. section, and apparently of recent rolling, the fracture occurring slightly more than two feet from the heel or joint, and perhaps about one foot from the end of the splice-bars. Whether the fracture was located over the tie or between ties, is not known.

The character of the break indicated brittleness of the steel, but no evidence of unsoundness, piping or other physical defect, was to be found by a minute examination of the fracture.

The only striking fact found by a chemical analysis of the rail, was the high percentage of carbon which was substantially twice the allowable amount. This, as it is pointed out, taken in conjunction with the low manganese and a normal phosphorous constituent (for Bessemer steel) would tend to make the rail brittle.

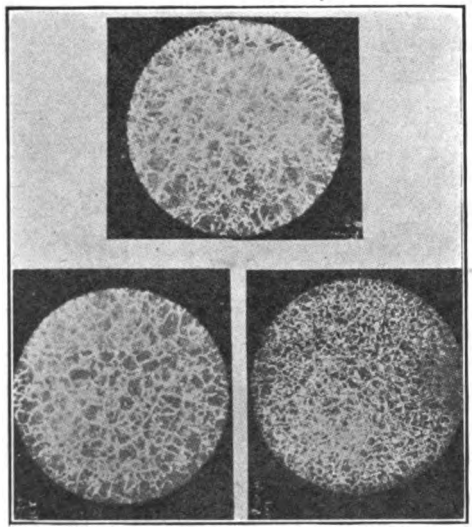


FIG. 1. Micro-photographs, showing structure in parts of broken rail.

The micro-photographs herewith shown (Fig. 1), were obtained by polishing the steel, etching with picric acids and photographing through a microscope of 100 diameters magnification. One photograph which was taken of the head web and base is indicated by circles A B and C in Fig. 2.

A Brinell hardness test was made upon the failed rail at the several points indicated in Figure 2, with the results as shown in the following table:

Brinell Hardness Tests on Failed Rail.
(For location of test spots, see Fig. 1.)

Location of Impression	Impression Millimeters Diameter of	Hardness Number
1	4.11	216
2	4.19	208
3	3.77	260
4	4.05	223
5	4.03	225
6	4.19	208
7	4.23	204
	Average	220

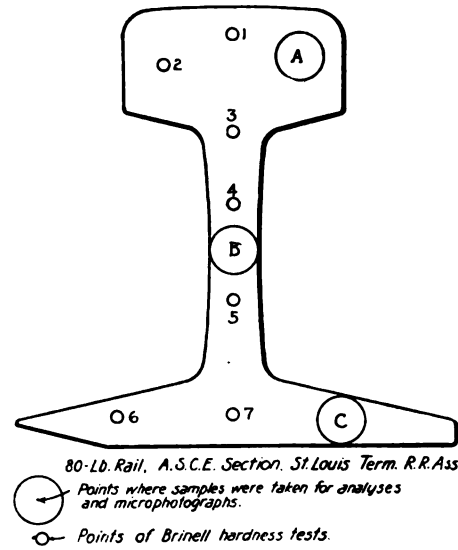

FIG. 2. Location of samples for an analysis and tests of broken rail.

Table 4.

Brinell Hardness Tests on 80-lb. Service Rail.

1	4.05	223
2	4.03	225
3	4.00	228
4	4.10	217
5	4.05	223
6	3.95	235
7	4.20	207
8	4.20	207
	Average	221

The Brinell test which is now a standard rail test, was made by a Brinell machine which presses a steel ball of 25-64 of an inch in diameter under a load or pressure of 6,614 pounds against the surface of the steel. The diameter of the impression left in the steel is measured, and the hardness number is proportional to and fixed by the diameter of this impression.

The following diagram graphically illustrates the results of the test:

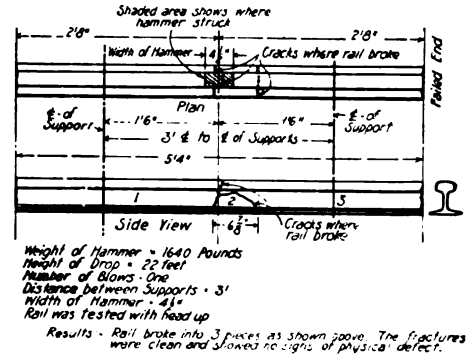

FIG. 3. Results of drop test on piece of broken rail.

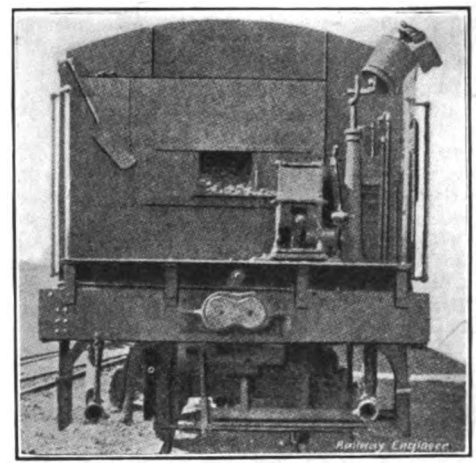
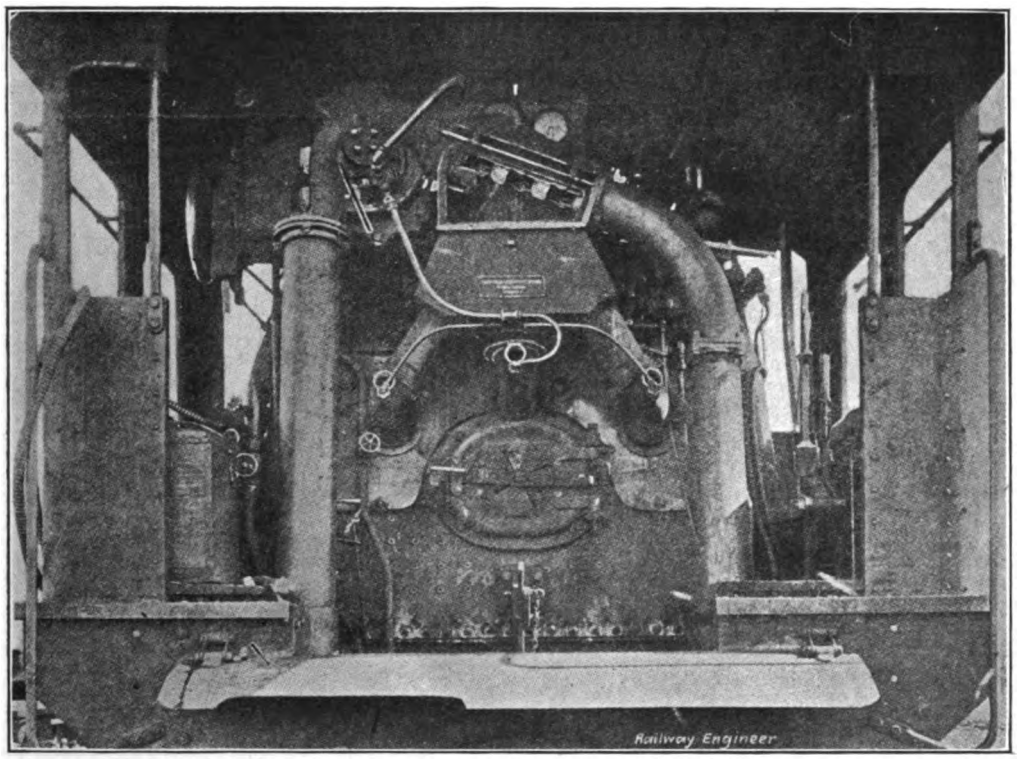
SOUTH AFRICAN LOCOMOTIVE FITTED WITH STREET MECHANICAL STOKERS.

THE publicity department of the South African Railways have recently issued a statement regarding the fitting of 2-6-6-2 mallet engines with street mechanical stokers. These engines are of the compound variety, with no superheater. The driving coupled wheels of the high and low pressure engines are of different sizes, in order to increase the hauling power on the heavy gradients.

The tender is of the ordinary type and is provided with a crusher of the moving bar type, worked by an engine placed behind the brake pillar. The fireman shovels the coal into the hopper of the crusher (shown in Figure 1) which reduces it to a uniform size. The coal falls from the crusher through a chute, into a receiver fitted behind the rear buffer beam of the engine, whence it is picked up by buckets working on a belt in the type shown in Fig. 2, and discharged into the central hopper on the fire box above the fire hole door. The buckets rise full on the left hand side and descend empty on the right hand side, and are worked by another smaller engine placed on the top of the fire box on the left hand side. There are three trays either to the middle or to the right or left coal-feeding pipes, whence it is blown into the fire box by the steam jets, the force of which is regulated by the cams, so as to deposit the coal just where it is required.



COAL CRUSHING HOPPER OF STREET MECHANICAL STOKER.



CAB OF 2-6-6-2 MALLET ENGINE FITTED WITH STREET MECHANICAL STOKER; SOUTH AFRICAN RAILWAY.

It appears to be a decidedly complicated machine, and while it is reported as giving better results so far as the locomotive is concerned, it should not be overlooked that the fireman has to attend to two auxiliary engines in addition to handling the same amount of coal. While the labor of shoveling the coal in the tender is avoided, every ounce of coal burned has to be transferred by hand into the crusher. In addition, the noise caused by the various operations is very great.

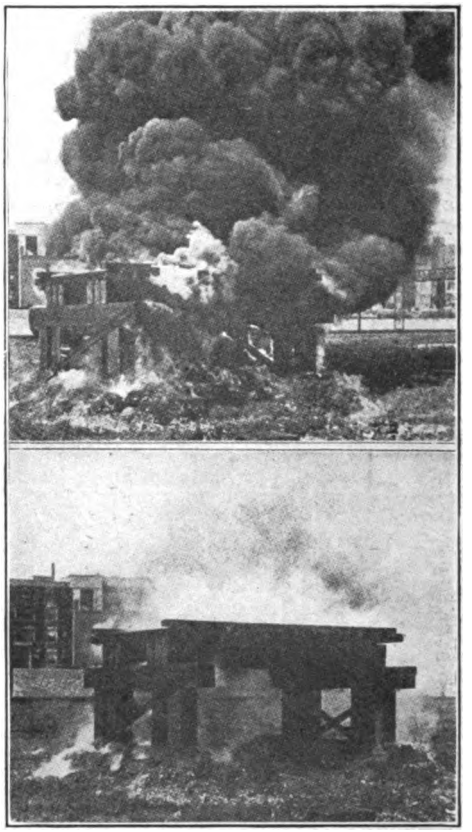
FIRE RESISTING PAINTS.

A NUMBER of interesting tests have recently been made on the Missouri River Bridge of the Illinois Central Railroad at Council Bluffs, Ia., in connection with a fire resisting paint. The floor of this bridge consists of a three-inch plank deck on which one coat of this paint, put on at a boiling temperature so that it would penetrate the wood, had been applied. After an interval of four weeks, it was tested by placing live coals at five different parts of the deck. These coals burned for an hour and ten minutes before going out, and an examination made immediately afterwards showed that the planking was only charred to a depth of 1⅜ inches and that the fire had not spread over the original areas covered. The following photograph illustrates the result of the test:

RESULT OF FIRE RESISTING PAINT TEST ON MISSOURI RIVER BRIDGE, SHOWING SLIGHT CHARRING OF WOOD.

On the following day, a test was also made of a one span structure specially erected for such purpose at Chicago. One coat of paint had been applied about three weeks previous to the test. Six large sacks of shavings, three bales of hay and one bale of straw, were scattered under the structure and it was fired. The following photographs illustrate the fierceness of the fire and the comparative lack of damage done to the structure. Although the stringers, ties and bents were a solid mass of flames shortly after the fire started, as soon as the paint began to come out of the wood, it formed a hard crust which soon extinguished them.



UPPER ILLUSTRATION SHOWS AN ATTEMPT TO BURN A SECTION OF TEST TRESTLE AT CHICAGO. LOWER PICTURE INDICATES EFFECT OF FIRE; SURFACE ONLY SLIGHTLY CHARRED.

Electrical

Norfolk & Western Railroad to Electrify.

THE Norfolk and Western Railroad has contracted with the Westinghouse Electric & Manufacturing Company to supply all the electrical apparatus required to electrify the Bluefield-Vivian section of its line some 85 miles in length.

The carrying out of this contract will give form to one of the most important projects of steam railroad electrification yet undertaken. The contract calls for the manufacture and delivery of twenty-six 130-ton electric locomotives of the single phase—two phase type, together with all required power house generating machinery and transmission apparatus.

Single phase alternating current of a frequency of 25 cycles and at 11,000 volts pressure will be supplied to the locomotives through an overhead suspended trolley wire and will be the identical type of the overhead system that has long been successfully used by the New York, New Haven and Hartford Railroad on its main line, by the Boston and Maine in the Hoosac Tunnel, by the Grand Trunk Railway in the Sarnia Tunnel and by the New York, Westchester and Boston Railway and for which installations the Westinghouse Electric and Manufacturing Company has furnished over 100 locomotives. The Norfolk and Western single phase-two phase locomotives, besides being very large and of enormous hauling capacity, will embody

Digitized by Google

many unique features and requirements of design, which, it is expected, will result in their showing unprecedented flexibility and economy of operation.

The Bluefield-Vivian Section serves the celebrated Pocahontas coal region, one of the largest coal fields in the world. The tonnage of coal handled amounts to 65,000 tons per day, necessitating trains weighing as high as 3,250 tons. It is to facilitate the handling of this heavy traffic that the electrical operation has been decided upon.

There are a number of grades on this section, the maximum being two per cent, and at the present three Mallet locomotives (the most powerful type of steam locomotives built) are required per train. One locomotive is used at the head of the train and two for pushing.

Only two electric locomotives will be required for this service and the present speed will be doubled. The extent to which this quick train movement will enlarge the capacity of the railroad is quite apparent.

One of the present impediments to rapid operation of this section of the road is the extension of a 3,100 foot tunnel which is difficult to ventilate. This tunnel under electric operation will of course, owing to the absence of smoke and noxious gases offer no impediment to frequent train movement.

Since the Norfolk & Western locomotives are intended for handling what is known among railway men as "tonnage trains" they will be built for running speeds of approximately seven, fourteen and twenty-six miles per hour.

Power for the entire electrified section will be generated in a central power house located at Bluestone, West Virginia, with an installed capacity of 27,000 kilowatts in turbo generators, supplied by the Westinghouse Company.

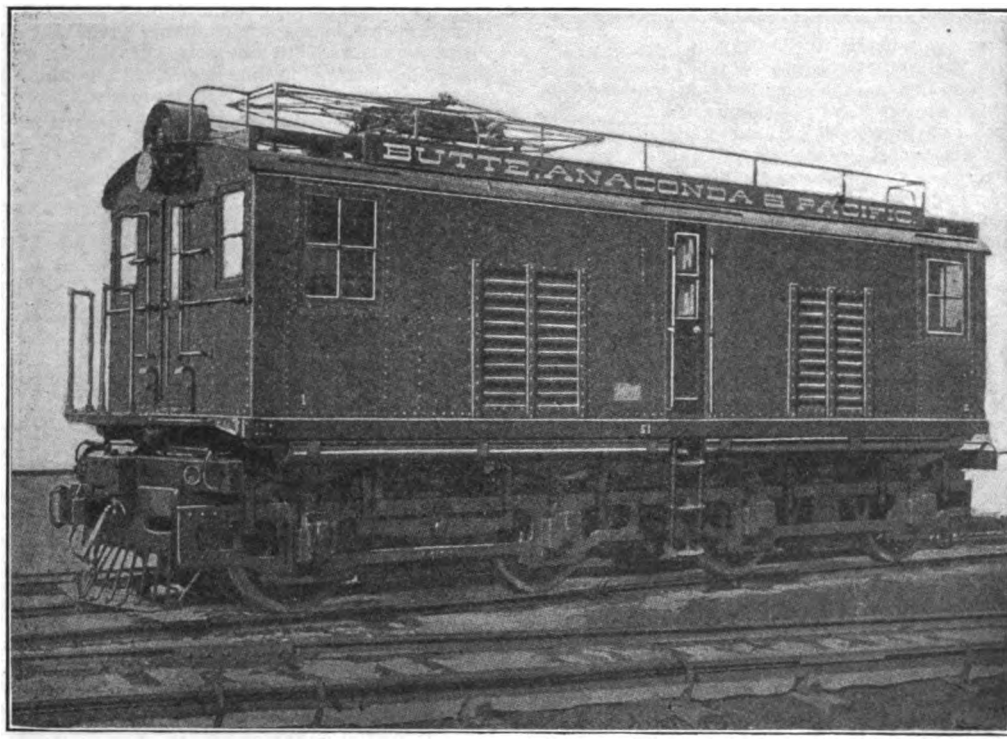
The traffic conditions of this section of the road are especially well adapted to electrical operation. It is in reality a separate engine division at present, and can be operated electrically without affecting the cost of engine service on other sections of the line.

ELECTRIFICATION OF THE BUTTE, ANACONDA AND PACIFIC RAILWAY.

ACCORDING to "Railway and Locomotive Engineering" the electrification of the Butte, Anaconda & Pacific Railway is one of the large installations of electrical equipment for steam railroad service and is of exceptional interest because it is the first in this country where direct current locomotives operating on as high a potential as 2,400 volts will be employed.

The adoption of the 2,400-volt direct current system for this railway was determined after a comprehensive study of local conditions and requirements. Service consists principally of hauling long trains of copper ore over heavy mountain grades. By the use of 2,400 volts unusual economies in initial expenditures were possible as the high voltage decreases the number of substations and amount of copper wire several times below that required for 600 volts.

The section of the road that has been equipped



BUTTE, ANACONDA AND PACIFIC RAILWAY TYPE OF ELECTRIC LOCOMOTIVE.

Digitized by Google

lies between Butte and Anaconda, Mont. It comprises 30 miles of main line single track and numerous sidings, yards, and smelter tracks, aggregating a total of about 90 miles on a single track basis. The haulage of copper ore from the Butte mines to the smelters at Anaconda, together with all mine supplies, lumber, etc., moving in both directions, amount to practically 5,000,000 tons of freight per year. Complete freight trains weighing 3,400 tons are made up of fifty loaded steel ore cars and will be handled against a ruling grade of 0.3 per cent by two of the locomotives coupled together and operated as a unit. Only one locomotive will be used for making up trains in the yards.

The initial equipment consists of seventeen locomotives of the 0-4-4-0, fifteen for freight and two for passenger service. Two of these freight locomotives will haul the 3,400-ton trains at a maximum speed of 15 m. p. h. against the ruling grade and at 21 m. p. h. on level tangent track. The passenger locomotives are of the same design as the freight locomotives except they are geared for a maximum speed of 45 m. p. h. on level track. A schedule of eight passenger trains per day, four each way, is maintained, the average train being composed of a locomotive and three standard steam road passenger coaches. All the locomotive equipment, as well as the sub-station apparatus and overhead line material, was designed and built by the General Electric Company.

FREIGHT LOCOMOTIVE FOR BRITISH COLUMBIA ELECTRIC RAILWAY COMPANY, VANCOUVER, B. C.

FIVE fifty-ton electric locomotives have recently been built for the British Columbia Electric Railway Company, Vancouver, B. C. These locomotives are intended for freight service, and are similar to a number of sixty-ton locomotives recently constructed for the Southern Pacific Company. They are standard gauge, and are of the double track type with a central cab of the steeple type. This type of locomotive, because of its flexibility and simplicity of construction, is proving very successful in freight, switching and industrial service where severe operating conditions are frequently met. Each locomotive is equipped with four Westinghouse No. 308-D-3 box-frame commutating-pole 600-1200 volt railway motors, and Westinghouse type HB Unit Switch Control.

The 308-D-3 commutating-pole motors are adapted to subway, elevated and trunk-line railroad service. Since this motor is high powered and of the commutating-pole type, heavy loads can be handled without encountering motor troubles that are incident to such conditions. The No. 308-D-3 motor is well adapted where 1200-volt direct current operation is desired, and for such service, two motors are permanently connected in series. The box-frame construction offers decided advantages on account of its solid mechanical construction, effective protection, and the alignment of all parts. The commutating-pole feature of this motor makes it operate reliably and economically, for heavy overloads can be handled safely, and also a large range of over-voltage is permissible without serious consequences, which is incident to such heavy service in which this equipment operates.

The Westinghouse Unit Switch Control used is similar to the control used extensively by many electric railways and electrified steam roads. This control is especially adapted to locomotive service where currents of high value are to be handled and broken, for due to the inherent construction of the unit switch, there is positive action in the making and breaking of circuits carrying heavy currents, and due to the high pressure between contacts made possible by closing all switches by compressed air, no overheating or burning is experienced.

This control has a great many advantageous features, and last, but not least, it is extremely simple and accessible for inspection, reliable in operation, and economical to maintain.

Principal items of the control equipment consists of the following apparatus:

2 Master Controllers,
2 Switch Groups,
2 Reservers,
1 Series-Parallel Switch,
1 Line Switch.

CANADIAN PACIFIC RAILWAY STATION AND ROYAL ALEXANDRA HOTEL, WINNIPEG, AS THEY WILL APPEAR WHEN EXTENSIONS CONTRACTED FOR ARE COMPLETE.

similar dimensions, and ten private dining rooms.

The station accommodation will be rearranged so as to provide special waiting rooms for immigrants; a complete rearrangement of the space allotted for the handling and checking of baggage, and the construction of a subway with connecting stairways between the hotel and the station.

THE MOUNT ROYAL TUNNEL OF THE CANADIAN NORTHERN RAILWAY.

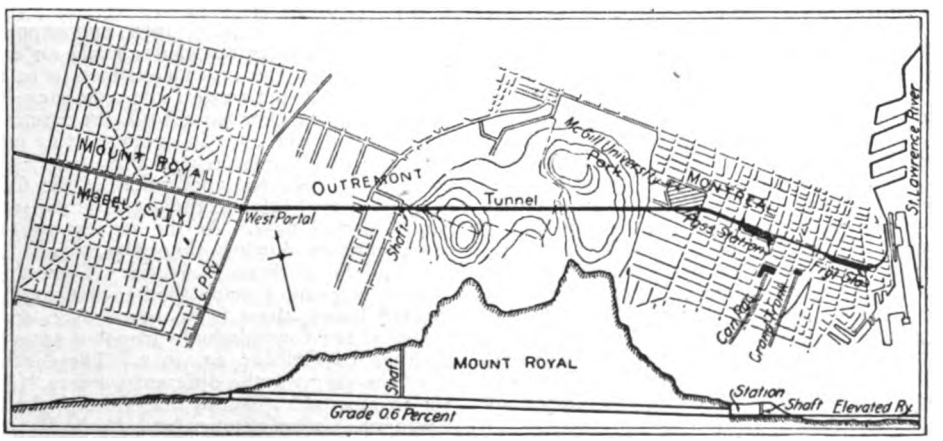
THE "Canadian Railway and Marine World" contains an interesting article by S. P. Brown, chief engineer of the Canadian Northern, Montreal Tunnel and Terminal Company, regarding the new Mount Royal Tunnel being built to connect Mount Royal and Montreal.

Discussing the general features of the project, Mr. Brown says:

"The natural location of the business centre of Montreal, between Mount Royal and the river, made the problem of entry at first appear complicated. To enter from either end of this strip meant a detour that was undesirable, and might have resulted in two separate stations for the eastbound and westbound traffic. A study of the topography and economic distribution of the city and island showed that a tunnel was the logical, as well as the economical, method of entry. It was found that the railways coming from the west could be brought from a convenient site for yards, shops, etc., near the Back River, to a junction point with the Quebec lines near the present Jacques Cartier Union Railway (G.T.R.) and thence at a very flat grade to a tunnel portal at its crossing with the C.P.R. belt line, about a mile from the Outremont yard. Thence the line will pass through a twin tunnel 3.25 miles long, down a 0.6 per cent grade to a passenger terminal in the very centre of Montreal.

"From the main passenger terminal the tracks may be extended across to the lower town on a viaduct at a level grade to connect with a viaduct along the harbor front, proposed by the Harbor Commissioners of Montreal, and a possible bridge across the St. Lawrence River. Such an extension would also include in the commercial part of the town an elaborate freight distributing depot, a department to which the C.N.R. is giving most serious thought at present. In connection with this freight department, large sorting and transfer yards are being developed back of the mountain and east of the city, where most of its shunting and mechanical part of the freight transference will be accomplished.

"The city of Mount Royal, or as it is locally termed, the "model city," is laid out on a rectangular plan, with four diagonal boulevards radiating from the railway station, which forms the centre of the town site. There is also a meandering boulevard connecting a series of parks and playgrounds distributed over the city, in general midway between the central park and the station site and the city limits. The land, consisting of a gently sloping plane, makes the situation ideal for drainage and sanitation. The



LOCATION OF THE MOUNT ROYAL TUNNEL ON THE CANADIAN PACIFIC BETWEEN MONTREAL AND MOUNT ROYAL.

Digitized by Google

streets will be paved principally with asphalt and macadam, the stone for which will be taken from the tunnel excavation. Street car service and lighting have already been arranged for with local companies in Montreal, which assures excellent service, and through trolley connections with Outremont, Westmount and Montreal proper are contemplated. The lots are being sold under very rigid building restrictions, as it is desired to produce a quarter of town for the better class of people who are rapidly being crowded out of the more desirable parts of Montreal, as well as for the city's rapidly growing population. A short multiple unit train service through the tunnel will bring the Mount Royal station within a very few minutes of the main passenger terminal in the city proper and trolley cars will tie the street car lines of the 'model city' with those of Outremont and Montreal. A small freight yard near the west portal of the tunnel will serve for the delivery of local freight and express and for the manipulation of multiple unit trains during the rush hours. The entire terminal scheme is to be utilitarian from the Back River to the waterfront. The idea is to produce structures and developments that will be attractive to the eye and so designed and disposed as to be self-supporting in themselves without the assistance of the ordinary railroad traffic."

Interstate Commerce Commission

Abstract of Express Rate Decision.

THE recent decision by the Interstate Commerce Commission reducing express rates throughout the country, and its effect upon the interests involved, are discussed in another section of this issue. The following is the official abstract of the Commission's report:

The report and order of the Interstate Commerce Commission in the Express Investigation (written by Commissioner Marble) lays the following requirements upon the express companies:

The adoption and observance for two years of a schedule of rates applying between all points in the United States. (This is the schedule which was submitted to the carriers by the Commission in the report of Commissioner Lane on June 8, 1912.)

The adoption of the block system of stating rates, which was set forth in the report of June 8, 1912.

The establishment of a uniform classification, which is contained in an appendix to the order.

The publication of a joint directory of express stations, fixing the location of each such station by block number.

The publication jointly of the pick-up and delivery limits at each station.

The adoption of revised rules and regulations.

The adoption of a new form of express receipt.

The requirement of the order of June 8, 1912, that a label shall be attached to each parcel, is modified to the extent that, in case of shipments or perishable property, consisting of two or more packages, the label need be attached to only one package.

The order includes five appendices consisting of classification, directory, and rate tables, and covering more than 1,000 pages of matter.

Under the present method of compiling tariffs some 900,000,000 separate rates are published by the express companies. Under the block system of statement prescribed by the Commission this number is reduced to less than 650,000 rates. At the argument it was stated by representatives of the carriers that the block system is practicable and satisfactory. It is considered by the Commission that its simplicity and intelligibility will afford the means for satisfactory publication of express rates.

A table attached with the decision shows comparatively present express rates, proposed express rates and present parcel post rates between various selected points. Representative cities have been selected, and rates between each such city and 75 other points have been shown. The order provides that as between any two points rates shall be the same in both directions, and shall be the same whether one or more carriers participate in the haul. That is to say, the rates prescribed are joint rates in all cases where the route between any two points is over the lines of more express carriers than one.

The most important change in rates made by the Commission's order is by way of modification of the present graduated scale of parcel rates. The 100-pound rates for short distances have either been but slightly reduced or have been left unchanged. For long distances the 100-pound rates have been somewhat reduced. By the changes in the graduated scale, however, the rates for packages weighing 50 pounds or less have been practically all reduced. A comparison of the rates prescribed with the parcel post rates now in effect discloses that the prescribed express rates for packages over 4 pounds when carried for distances of more than 200 miles and less than 3,000 miles are generally lower than the parcel post rates. For distances of more than 3,000 miles the parcel post rates and the prescribed express rates are practically the same.

The report is largely devoted to a discussion of the showing made by the express companies in opposition to the proposed rates. After the submission of these rates to the express companies by the report of June 8, 1912, and supplements thereto, the express companies made an estimate of the reductions in revenue claimed to be caused by the Commission's rates. At a hearing held in Washington on October 9, 1912, the carriers estimated these reductions in revenue at as much as 30 per cent. It was claimed that these estimates were based upon the application of the Commission's proposed rates to the actual business of various selected days. At the request of the express carriers further time was given for the preparation of these estimates. Thereafter the express companies made further showings of estimated losses, these being based upon an application of the Commission's proposed rates to the business of October 23, 1912. These estimates of losses vary for the different carriers. According to one table filed by the Adams, American, Southern, United States, and Wells-Fargo Express companies, however, the proposed rates would have caused to these companies a reduction of revenue on all interstate traffic equal to

Digitized by Google

15.33 per cent of the gross revenue from all sources including revenue from the transportation of money and valuables.

The report finds, however, that the business of October 23, the day selected by the carriers for this showing, was abnormal in character, the receipts of the companies being a little more than 12 per cent greater on that day than the average daily revenue for the preceding fiscal year. Further examination showed that the average weight of parcels carried on that day was practically the same as the average weight of parcels for selected periods theretofore reported to the Commission. The average charge per package, however, realized by the carriers on that day was considerably in excess of the average charge per package received by the carriers on other selected days previously reported to the Commission.

It was also found that the estimated revenue per piece of express matter resulting from the application of the Commission's proposed rates to the business of October 23, 1912, was for six of the nine respondents in excess of the average receipts per package for the same respondents from their present rates for certain selected days in the past theretofore reported to the Commission. The conclusion is that the business of October 23 contained either an excess of long-distance business or an excess of merchandise business, which resulted in increasing the average returns to the carriers for that day, and which also enabled a showing of estimated losses to be made which would not have been possible had the day's business been normal. The Commission therefore adheres to the conclusion that the rates proposed by it are just and reasonable, and directs that they be established on or before October 15, 1913.

The basis of the classification prescribed is that all articles of merchandise of ordinary value are to be carried at first class or ordinary merchandise rates. All articles of food and drink (with a few exceptions) are second class and are to be carried at 75 per cent of the first class rate. Articles of extraordinary value must be so declared at time of shipment. The order provides for special rates based upon such extraordinary value.

The form of express receipt shown by the order is the result of conferences between the Commission's representatives and representatives of the express companies. It more carefully guards the rights of shippers than does the form of receipt now employed by the express companies. It provides that the liability of the carrier shall be limited to a maximum of $50 on each shipment weighing less than 100 pounds and a maximum of 50 cents per pound on shipments weighing more than 100 pounds, unless a greater value is declared at the time of shipment. All rates are based on carrier's risk to the limit of the stated value, all rates based upon owner's risk being eliminated.

Under the present rules where two or more packages are shipped by one consignor to one consignee the rates charged are on the basis of the aggregate weight of both packages estimated at 20 pounds each when weighing less than 20 pounds, making the minimum charge for two packages in one shipment that applicable upon a weight not less than 40 pounds. It is directed by the report that this rule be so amended that when the average weight of all packages in a combined shipment shall be ten pounds or more the charge shall be upon the aggregate weight. If the aggregate weight is less than 10 pounds for each package included in the shipment, the charge is to be made upon an average weight of 10 pounds per package.

The rates prescribed for newspapers and periodicals, as well as bread and similar articles, are substantially the same in amount as the present rates.

A permanent committee has been appointed to revise the routes of express carriers so as to eliminate the circuitous routes which are now a cause of considerable complaint on the part of shippers. This committee is composed of representatives of the express companies and of the Commission. The report says:

"The long delay in the issuance of the Commission's order as to the rates requires explanation. It has arisen from the extraordinary care exercised by the Commission to make its order entirely fair to the express carriers. To this end prolonged investigation of the actual business of the various respondents was made, approximately one year being consumed in examining the books and records of the respondents. The results of this painstaking investigation are to be found in the working papers of the Commission, and in the various tables and exhibits prepared therefrom, all of which were placed in the record. Thereafter printed inquiries were addressed to the respondents requiring voluminous and exhaustive statements from them supplementary to the information secured by the examination of their books and records. These responses were then digested in the office of the Commission, the extensive statement of facts contained in the appendices to the report of June 8, 1912, being in large part obtained therefrom. Also the existing tariffs of all the respondents were examined and subjected to minute and painstaking analysis and comparison one with the other as well as with the tariffs of rail carriers for transportation of property over the same routes.

"Throughout the time of this examination, moreover, informal complaints, some thousands in number, were received from shippers to the effect that specified rates and practices of the respondents were unjust and unreasonable. A volume of these informal complaints was incorporated in the record and brought to the attention of the respondents. Particular attention was given to the examination of each such complaint with a view to further familiarizing the Commission with the practical difficulties experienced by shippers under the present rates and practices of the express carriers."

In addition to all the above, prolonged informal conferences between the Commission and the executive heads of the respondents, including traffic officers and counsel, were held in the endeavor to arrive at a common understanding of the various problems involved. At these conferences proposed bases for rates were informally laid before the Commission by the respondents, and an effort was made to arrive at a common understanding in this regard also. These conferences developed, however, that no common ground could be found, owing to the impossibility of acceptance by the Commission of the percentage contracts between the express companies and the rail carriers as making a legal or moral necessity for higher rates than could be justified otherwise. The offers of the express companies

Digitized by Google

indicated the possibility of agreement upon a 100-pound scale substantially lower than that here prescribed. The chief opposition of the respondents, then and now, is to any substantial modification of the scale of rates for the transportation of packages less in weight than 100 pounds. While such packages must have rates based upon weight, yet as they move as separate shipments with individual pick-up and delivery service each must pay for such service as an individual shipment. The amount of such service varies but slightly with the weight of the package and not at all with the length of its rail journey. It is entirely performed by the express carrier, yet the demand is that shippers shall be compelled to pay upon such packages rates sufficiently high to yield to the express carrier, out of a division ranging from 35 per cent to 60 per cent, an amount sufficient to compensate it. Every addition to the rates paid by the shipper for such service as distinguished from the line haul is cut in two by the contracts and must be doubled if the express carrier is to be compensated.

"Likewise, in the case of rates for long distances, the service performed by the rail carrier, especially on shipments of large weight, is relatively much greater than that performed by the express company. As to these rates, the contention is that full compensation for the rail carrier must be found in half or less than half thereof. Any allowance in such rates for the benefit of the rail carrier is cut in two by the contracts.

"The Commission has repeatedly decided that these contracts can not be accepted as a basis for the making of rates. If confirmation of the correctness of this view were needed, it is found in the figures hereinafter discussed, which show that since 1909 the increased traffic of these respondents has been insufficient to meet the increases in the demands of the rail carriers.

"The bulk of the express business is small packages carried for comparatively short distances. Under the percentage agreements no fair allowance for pick-up and delivery service on such packages is possible, because every such allowance is at once divided with the rail carriers.

"The inevitable result of the constantly increasing proportion of express revenues paid to the rail carriers must be to constantly increase the cost of service to the shipper if the Commission is to yield to the demand that these contracts be accepted as binding upon it. If, as the answers of these respondents claim, their net operating revenues are now insufficient to provide adequate return upon the capital employed, then, if this Commission is to regard these contract payments as a legitimate charge upon the traffic, the logical result must be to increase and not to decrease express rates. As the contracts are mere expressions of the wills of the parties thereto, they could always be so formed as to justify any rate that the beneficiaries thereof might consider possible of collection. It was therefore necessary to end the informal conferences with the executive heads of the express companies without agreement upon any basis for the rates upon small packages for short distances as well as for the rates upon large packages for long distances."

As a result of all the foregoing efforts, the Commission returned to its ordinary procedure in rate cases and itself formulated and published the rates embodied in its report of June 8, 1912. It did, however, in this regard adopt the unprecedented method of exposing the rates prepared by it to the analysis and criticism of the respondents before the issuance of its final order. The order of June 8 in this regard was as follows:

"'That said respondents be, and they are hereby, notified and required to show cause before this Commission, on or before the 9th day of October, 1912, why the following rates set forth as proposed rates should not be put into effect between the points herein designated, as just, reasonable, and nondiscriminatory rates, and in the manner and form for the stating of said rates proposed in the accompanying report and appendix.'

"By this method it was hoped that every valid objection to the rates made by the Commission might be developed, and that all changes necessary to make them entirely just might be made in advance of their imposition."

While no conclusion is based upon the fact that a considerable amount of business is being carried free by the express companies, the fact is noted. It appears that something more than $2,000,000 worth of transportation is given yearly to the holders of franks without charge.

With regard to parcel post and its effect upon the express companies the report says:

"A considerable portion of respondents' argument is to the effect that the loss of business to the parcel post will so far reduce their earnings as to render all previous investigations valueless. This is equivalent to saying that inasmuch as shippers have been given the convenience and economy of the parcel post the express carriers must, on that account, be allowed to charge rates higher than would otherwise be reasonable. That is to say, the Commission is called upon to take from the shippers of the country all the benefit that they receive from the parcel post and give it to the respondents in the form of higher rates upon the remaining express business.

"Whenever it has been suggested in the argument, however, that fairer rates and juster methods would bring to the express companies a volume of business which is now moving by freight the reply has been that any increase of express business would be disadvantageous because it would retard the operation of passenger trains. According to this argument the situation is, therefore, that losses of business must be followed by increased rates upon the remaining business, but that any increase or replacement of business is to be prevented

"With regard to the small package business of the parcel post it should be noted, however, that it will still be carried upon the railroads of the country. So far as the rail carriers are concerned, it is of no consequence to them whether they furnish rail transportation for the express respondents herein or for the Postoffice Department. The express companies, moreover, will not experience a gross loss of their earnings upon these small parcels, but only of the net difference between their earnings heretofore and the cost to them of furnishing terminal service upon these parcels. The Commission's conclusion is that any losses of business for the future may easily be replaced by new business if the express carriers are so inclined, and that the establishment of the parcel post is not a justification for any higher scale of rates than the one here shown to be reasonable.

"The Commission's order is for two years only. That period will give abundant opportunity for a test of these rates under varying conditions

Digitized by Google

amounting to a normal average. In no other way can the absolutely proper rate basis for respondents be finally determined. Respondents are also at liberty at any time to bring forward new facts as a basis for a petition for modification of this or any other order."

Ruling on Shippers' Informal Complaints.

THE Commission has established a ruling to the effect that shippers in the future who file informal complaints will be compelled to prosecute their claims on the Commission's formal docket, and those who abandon such claims will not be allowed until after five years have elapsed, to revive the complaint.

Mississippi River Case Decided Against Railroads.

ASIDE from the express rate decision, the ruling handed down by the Commission covering what has been commonly known as the Mississippi River Rate Case, was the most important of the month. The Commission held to be excessive the present rates between the upper Mississippi River crossings in the State of Iowa and points east of the Indiana-Illinois State line. These rates were held not only to be excessive in themselves but also discriminatory when compared with rates to the lower crossings. The present first class rate of 97 cents from New York City to the Upper Crossings was ordered to be reduced to 90 cents by November 1st and the other classes and rates from other Eastern points reduced accordingly.

In what is known as the interior Iowa cities case the Commission condemned the rate adjustment of the New York Central and other railroads upon which through charges are based on class traffic between points in the interior of Iowa and points in the territory east of the Indiana-Illinois State line. The through rates in this case were held to be unreasonable because of the excessive and discriminatory proportional rates applied between the Mississippi River and the interior Iowa points. The roads were asked to submit revised freight tariffs drafted in accordance with the decision.

Rates to interior Iowa cities from Chicago also were held to be unreasonable in the case brought upon the complaint of the Cedar Rapids Commercial Club and others. In this instance the class rates between Chicago and points on the Missouri River are adjusted on an 80-cent scale and between Chicago and points on the Mississippi River in Iowa on scales of from 37.5 to 41.7 cents. The Commission held that the rates between the interior cities and Chicago are unreasonable and discriminatory in comparison with the rates to the river towns. The Rock Island and other roads were requested to submit to the Commission a revised basis of these rates grading the 80-cent Missouri River scale back across the State.

In the case of the Colorado Manufacturers' Association and others against the Atchison and other railroads the Commission held that the rates from Chicago and the Mississippi River to Colorado are not unreasonable, but that the rates eastbound between the same points are unreasonable and must not exceed the westbound rates. Furthermore, the Commission held that the class rates between Colorado common points and the Missouri River are excessive. Lower rates were prescribed to take effect September 15th.

Payment to Manufacturers' Railway of St. Louis Held Illegal.

THE Commission has issued a supplemental decision in the case of the Manufacturers' Railway Company of St. Louis, holding the present payments to the Manufacturers' Railway by the trunk lines serving St. Louis under their absorption tariffs are unlawful and should be cancelled. The Commission reversed its previous finding that the trunk lines serving St. Louis are subjecting its shippers to undue prejudice because they absorb the charges of the Terminal Railroad Association in order to make delivery on the rails of that association at the St. Louis rate, while refusing contemporaneously also to absorb the rate of the Manufacturers' Railway, an independent terminal carrier.

The Commission noted "there is a well defined distinction between absorptions, allowances and divisions of joint rates, which, once recognized in the establishment of the joint rate, will render immaterial the question whether, in this case, the stock of the Manufacturers' Railway and of the Anheuser-Busch Brewing Association, its principal industry, is in common or independent ownership, as the latter will then necessarily be treated in all respects upon the same basis as will the shippers located on or served by the Manufacturers' Railway, who have no interest in that railway or in the brewing association."

The Commission now asserts that through routes and joint rates should be prescribed between the trunk lines and the Manufacturers' Railway, under which the trunk lines will retain their full rate to St. Louis, the division of the joint rate accruing to the Manufacturers' Railway to be paid to it by its shippers, including the Anheuser-Busch Brewing Association, instead of by the trunk lines.

Ruling on Mexican Freight.

THE Commission has recognized the serious conditions which exist in Mexico on account of the revolution, by issuing the following special conference ruling with reference to freight consigned to that country:

"As to shipments from points in the United States to points in Mexico which are held at the border by reason of the carriers being unable to transport them to destination on account of revolutionary conditions in Mexico, the carriers will be permitted to file with the Commission a proper application for authority to establish on one day's notice tariffs naming the conditions and rates under which they will return or otherwise dispose of the property which has been billed to points in Mexico and which they have been unable to deliver because of the revolutionary conditions in Mexico."

This ruling was adopted at the conference held the latter part of July, and it is understood that the serious conditions in Mexico was brought to the attention of the Commission not only by the railroads themselves but also by administration officers of the Government. In this connection, also, the Commission rescinded its ruling relative to granting passes to officers

Digitized by Google

and employes of railroads in Mexico, and substituted the following:

"Free interstate transportation may lawfully be issued to officials of any railroad in an adjacent foreign country which has filed joint tariffs and concurrences in connection with interstate carriers in the United States, without reservation as to the jurisdiction of this Commission."

Report on Railroad Track Scales.

THE Commission has made public its report on its recent investigation of railway track scales. It is asserted that a majority of such scales now in use in the United States should be rebuilt in order to obtain reasonably accurate results. The Commission says that as a result of the investigation representatives of shippers have this matter under consideration with the railroads and it is expected that satisfactory rules will be formulated.

"If not," says the Commission, "the matter will be further proceeded with by the Commission and any particular rule can be made the foundation of complaint."

The commissioner says: "This investigation was undertaken in consequence of numerous complaints received from all sections that the weights under which freight charges were assessed were grossly inaccurate and that great difficulty was experienced in correcting these inaccuracies."

It is added that "the principal complaint was against carload weights and the weighing of carloads by track scales has been the principal investigated, although some attention has been incidentally given to platform scales."

The Commission says that as a result of the investigation some reforms have been made by certain carriers and that the Pennsylvania Railroad has given some attention to the correct sealing of cars.

The Commission says that in its opinion some Federal authority, perhaps the Commission, should be given authority to fix the point at which track scales shall be installed; to prescribe the standard to such scales and their installation; to test or supervise the testing of such scales; and to supervise the operation.

The report says in part:

"The results of this investigation have abundantly justified the proceeding. The first hearing made plain the deficiencies of the carriers in this respect and immediate steps were taken for the betterment of weighing conditions which have resulted in most marked improvement.

"Looking at conditions as they existed when the order instituting this investigation was made on January 15, 1912, this can be affirmed with some confidence:

"Three-fourths of all the track scales in use in the United States were of the defective design or improperly installed. Less than one-fourth were properly inspected. Not more than ten per cent were accurately tested and a majority were not in any proper sense tested at all. The methods of weighing were heedless and unsatisfactory in many cases. The stenciled car weights upon 80 per cent of all cars were erroneous. While checks weighing at certain points where better facilities were available and superior operating conditions prevailed, tended to reveal many of the original erroneous weights, these changes in the original weights were a source of constant irritation and inconvenience to shippers.

"The carriers insist that these errors were as often in favor of, as against the shipper and that on the whole they would offset one another. There is not and there can be no intelligent opinion upon this point, nor is this perhaps material.

"The freight rate is in most cases assessed by the hundred pounds. It amounts to the same thing whether the rate be high or the weight be excessive. Inaccuracies in weighing result in the imposition of unreasonable charges and in discriminations between shippers just as really as do differences in the freight rates itself.

"Nor does it meet the situation to say that the railroads have given to one shipper by assessing charges upon too low a weight, what it has taken from another by enforcing an excessive weight."

Railroad Revenues.

THE Commission has issued a preliminary analysis of the revenues and expenses of railroads for the fiscal year recently ended. The analysis shows that the roads had net operating revenues of $915,277,797. The revenue per mile was $13,984, against $12,807 the previous year and the expense per mile averaged $9,677, against $8,839 the year before. This indicates an average increase of $339 per mile in the net revenues of the roads. The analysis deals with railroads with $1,000,000 or over of yearly revenues.

Cause of Railway Accidents.

ACCORDING to the latest statement of the Commission on railway accidents and their causes, defective railway and defective equipment, jointly, were responsible for more than 70 per cent of all the derailments on steam railroads of the United States during the quarter ended March 31st, last. Of derailments due to defective roadway, more than 20 per cent were caused by broken rails.

During the quarter 158 persons were killed and 3,628 were injured in train accidents, these figures showing a decrease of 109 killed and 1,157 injured, as compared with those for the corresponding period of 1912.

In other than train accidents, including accidents to employes while at work, to passengers getting on or off cars, and to trespassers, 2,086 persons were killed and 17,194 injured, showing a decrease of 30 killed and an increase of 1,480 injured.

By industrial accidents, not involved in train operation, but occurring to railway employes on railway premises, 97 were killed and 26,812 injured, a decrease of one killed and an increase of 3,836 injured.

The total shows a decrease of 140 killed and an increase of 4,159 injured, as compared with the corresponding period in 1912.

Another Expense Item to be Reported.

THE Commission has issued instructions to the railroads that a new item of expense, due to the work of taking physical valuation of the roads, should be estimated in their

Digitized by Google

regular reports to the Commission. The order states that this account should include such expenses as the salaries of clerks specially employed for the work, traveling and other expenses, etc. The new rule went into effect July 1, 1913.

The Abolishment of Free Delivery at Baltimore and Washington Upheld.

THE Commission has refused to suspend the tariffs of the Pennsylvania and Baltimore and Ohio Railroads, abolishing free city delivery at the cities of Washington and Baltimore, which has been in operation for a number of years. The refusal of the Commission to suspend the tariffs is tantamount to the refusal of a court to grant an injunction and the tariffs went into effect on September 1st. The notice refusing the petition for suspension, reads as follows:

"Referring to joint petition of the Chamber of Commerce and Retail Merchants' Association of Washington, D. C., you are advised that the Commission declines to suspend the operation of the Baltimore and Ohio Railroad and Pennsylvania Railroad tariff schedules, which, effective September 1, 1913, withdrew free store-door collection and delivery service in Washington and Baltimore.

"This action on the part of the Commission is without prejudice to your right to file formal complaint."

A similar notice was sent to Baltimore.

ORGANIZATIONS.

Presidents Elliott and Hannaford Entertained at Dinner.—On August 11th, the Association of Commerce at St. Paul, Minn., entertained Mr. Howard Elliott, the retiring president of the Northern Pacific and Mr. J. M. Hannaford, the incoming president of the same road, at a dinner. Mr. Elliott in addressing the Association and its guests spoke of the possibilities of the new Union Depot at St. Paul and said in part:

"Three weeks ago, I had hoped to remain in St. Paul, and one piece of work I had hoped to help work out was the problem of a new Union Station. This problem is more difficult than it would appear. Money rates are much higher than formerly. To raise the twelve or fifteen million dollars necessary for this project and pay six per cent upon it is much more difficult than when the rate was four per cent. And it is especially difficult in the face of a two-cent passenger rate, instead of three cents, and the other adverse conditions brought about by unfavorable legislation.

"There seems to be an awakening, however, on the part of the whole country, to that fact that if all is to be done in this direction that the railroads want to do, there will have to be some cessation of this continuous assault upon the railroads by the legislative bodies. In order that the public may be well served, and their employes well paid, the railroads must be permitted to make a legitimate profit on the money invested."

Mr. Hannaford, in making comparison between the Northern Pacific as it was when he entered it forty years ago, as it was when Mr. Elliott became president, and as it is to-day, said:

"Mr. Elliott came to us in October, 1903, and has remained with us ten years, the longest time any president has ever served. And I am free to say that those ten years under Mr. Elliott have been the most pleasant I have ever spent with the Northern Pacific. Under the policy Mr. Elliott has pursued, the road has been very prosperous, and it has done much to further the growth of the great Northwest. If I can be a part in the continuance of that policy, I will be happy."

Southern Railway Agents' Association Elects Officers.—The fifteenth annual convention of the Southern Railway Agents' Association held recently at Atlanta, Ga., was brought to a close with the election of officers for the ensuing year, as follows: C. G. Walker, Louisville, president; C. E. Coffey, East S. Louis, vice-president; W. J. Townsend, Augusta, secretary; and J. M. Bryan, Columbia, S. C., treasurer. The Executive Committee was named as follows: J. M. Fagan, Savannah; W. D. Post, Atlanta, and O. L. McKay, Meridian, Miss.

Meeting of the International Railway Congress Association.—The permanent commission of the International Railway Congress Association, at its meeting in Brussels, last month, decided that the next session of the Congress should be held at Berlin, June 21 to July 3, 1915.

End of Chamber of Commerce Tour.—Confident that they have succeeded in arousing a spirit of co-operation among business men of the west, the directors of the Chamber of Commerce of the United States ended at St. Paul, their long trip.

Among the speakers at a luncheon given to the visitors were James J. Hill, John H. Fahey, of Boston, and Harry A. Wheeler, of Chicago, president of the chamber.

Mr. Hill said that "big things must be done in a big way," and that "the success of the Chamber of Commerce of the United States will be measured by the support given it by the business men of the country."

National Industrial Traffic League Opposes Bill.—The National Industrial Traffic League has instructed its legislative committee to use its influence in opposition to a bill pending in Congress which is designed to empower the Interstate Commission to enforce a uniform classification of freight rates throughout the country. In lieu of such a law the league favors the creation of a committee composed of railroad officials from the southern, eastern and western sections of the country which would devote its entire attention to classification matters and permit shippers to present evidence and arguments before it in relation to the classification problems at least once a month.

Legislative Board of Order of Railway Conductors Formed.—A legislative board of the Order of Railway Conductors, has been organized at Jackson, Miss., to pass upon the merits and demerits of office-seekers and to look after legislation affecting railway organizations. At the last national convention of the Order of Rail-

Digitized by Google

way Conductors, it was made mandatory on all divisions of the order to participate in politics, each state being required to organize boards like the one formed at Jackson.

Convention of Locomotive Engineers at Montreal.—Delegates of the International Brotherhood of Locomotive Engineers, in annual convention at Montreal, after being officially welcomed to the city, heard an address by J. P. B. Casgrain, of Montreal, who urged the Brotherhood to take more active interest in politics. He complained that only one engineer had gone to Ottawa when the two-pays-a-month bill was passed by parliament in 1911.

Northern Pacific Entertain Passenger Agents.—At the close of the convention of the American Association of Passenger Agents, September 9th, at St. Paul, Minn., the agents became the guests of the Northern Pacific Railway for a tour of Yellowstone National Park. A special train took the party over the Northern Pacific to Gardiner, Mont., whence it was transported by stage coach through the park, the stage journey lasting five and one-half days. The entire trip occupied eleven days.

Mining Show and Annual Convention of the American Mining Congress.—The American Mining Congress will hold its first national Mining Show in Philadelphia, at Horticultural Hall, October 17th to 24th. "The exposition will be the first general national clearing house between the men who make mining machinery and the men who use such machinery," said Mr. Richard L. Humphrey, the director of the exposition. "It is proposed to bring together at the exposition a variety of exhibits affording instructive object lessons of greatest value to the future of the mining industry. The American Mining Congress and the first mining exposition will afford an unusual opportunity for the interchange of views, and is by far the most comprehensive attempt that has been made in the history of the mining industry to demonstrate its needs and the efficient utilization of the mineral resources of the country."

Outing of Traffic Club of Chicago.—The annual midsummer outing of the Traffic Club of Chicago, was held on Thursday, July 31st, in the form of a picnic at Dellwood Park, near Joliet, Ill., and was attended by over 350, including members and their families and guests. A special train from Chicago to Joliet and return was furnished by the Back Island, and special trolley cars between Joliet and the park by the Chicago and Joliet Electric Railway. The program included various races and contests, a chicken dinner, dancing, and a baseball game between teams of the Chicago and St. Louis Traffic Clubs.

To Preside Over International Engineering Congress, 1915.—Col. George W. Goethals, chairman of the Isthmian Canal Commission and chief engineer of the Panama Canal, has accepted the Honorary Presidency of the International Engineering Congress and will preside in person over the general sessions to be held in San Francisco, September 20-25, 1915.

Meeting of International Refrigeration Congress.—President Wilson will receive the foreign delegates to the International Congress of Refrigeration. The Congress will meet in Chicago on September 17th to October 1st, and the foreigners will stop here on their way West from New York.

Secretary Houston, as honorary president of the Congress, will be one of the principal speakers at the sessions in Chicago. Dr. Harvey W. Wiley, former chief chemist of the Department of Agriculture, also will speak.

Industrial Traffic Managers Meet.—At the regular meeting of the Industrial Traffic Managers a representative of the Postal Department explained in detail the workings of the parcel post, methods of tracing, etc.

Convention of Railway Gardening Association.—With the selection of F. W. Vail, of Dunellen, N. J., as president and New York City as the next meeting place the members of the Railway Gardening Association of America concluded the business of their seventh annual convention at Nashville, Tenn., August 14th. Other officers elected were: J. A. Byrne, Maryland, vice-president; W. F. Hutchinson, Pennsylvania, secretary; and J. K. Wingert, Pennsylvania, treasurer.

Outing of Traffic Club of Pittsburgh. — The Traffic Club of Pittsburgh held a notably successful outing at Idlewild Park, August 11th.

There were two chief events—a ball game between the teams of the Pittsburgh and Baltimore Traffic clubs, and a chicken and waffle supper.

About fifteen of the principal traffic men of Baltimore came to Pittsburgh as guests of the local club, and the trip was made to Idlewild in a special train, with President E. C. Sattley in command. N. J. Elliott, president of the Baltimore Traffic Club, was among the visitors.

Meeting of Mining Engineers.—The meeting of the American Institute of Mining Engineers was convened at Butte, Mont., August 18th. The sessions were opened with an address of welcome by C. F. Kelley, vice-president of the Anaconda Copper Mining Company. Charles F. Rand, of New York, president of the institute, responded.

Convention of Traveling Engineers' Association.—The twenty-first annual convention of the Traveling Engineers' Association, was held in Chicago from August 12th to 15th. This organization now has a membership of 957, a gain of 75 members over last year. Among the reports submitted was one on uniform instructions to engineers on the handling of superheated locomotives, which also contained, besides a list of valuable instructions, a brief outline of the purpose of the superheater.

A report by N. J. Howley, of the Erie Railroad, clearly pointed out the various means by which the operating department can assist in reducing fuel costs, and W. C. Hayes, superintendent of locomotive operation of the Erie outlined those features of the Master Mechanics' June Convention, which were of special interest to the Traveling Engineers.

A report on the subject of the car or locomotive brake equipment on the line and at terminals was read and discussed, and papers read on the

Digitized by Google

advantages obtained with a brick arch in locomotive service and on what can be done to eliminate the black smoke evil.

The Convention was also addressed by D. R. McBain, superintendent of motive power of the Lake Shore and Michigan Southern Ry.; H. C. Bayless, mechanical engineer, of the Minneapolis, St. Paul and Sault Ste. Marie Railway and W. B. Storey, vice-president of the Atchison, Topeka and Santa Fe Ry.

September Meeting of Central Railway Club.—The next regular meeting of the Central Railway Club will be held at Buffalo, September 12th. The chief feature of the docket will be an important paper on "Freight Car Privileges," by J. C. Fritts, of Scranton, Pa., master car builder of the Delaware, Lackawanna and Western Railroad.

LEGAL.

Government Seeks to Attack Suit Against Philadelphia and Reading.—The Federal Government has renewed its attack upon the so-called anthracite trust by filing a suit in the United States District Court at Philadelphia, against the Philadelphia and Reading and its affiliated companies, under the Sherman anti-trust law and the commodities clause.

This represents an effort on the part of the Wilson administration to take up this prosecution where it was left at the end of the Taft administration. There is, however, one feature which distinguishes this suit from the ones brought under the Taft administration and which is a new departure in suits under the Sherman anti-trust law. Attorney-General McReynolds in his prayer to the court to break the Reading's control over the Central Railroad of New Jersey and other corporations, which he contends are engaged in a conspiracy against the Sherman anti-trust law, asks that the Reading company be required to dispose of the capital stock of these corporations "to persons not its stockholders or agents, nor otherwise under its control or influence."

This prayer seems that Attorney-General McReynolds intends to have settled in advance in this case the question that caused so much controversy in the Union Pacific-Southern Pacific dissolution case.

The suit filed is a continuance of the action involved in the recent Supreme Court decision in the Reading case.

Commission's Order Reversed.—Judge Gray in the United States Circuit Court of Appeals at Philadelphia, has reversed the decision of the District Court, which awarded Naylor & Co. a verdict aggregating $9,000 in a suit against the Lehigh Valley Railroad, the Buffalo, Rochester & Pittsburgh Railway, the New York Central & Hudson River Railroad, the Philadelphia & Reading Railway Company, the Central Railroad of New Jersey and the Delaware, Lackawanna & Western Railroad, brought to recover damages for alleged illegal discrimination in freight rates.

Naylor & Co. complained to the Interstate Commerce Commission that it had been discriminated against in rates on pyrites cinder, by rail from Buffalo, N. Y., to points in Pennsylvania and New Jersey. The Commission upheld the complaint and awarded Naylor & Co. damages. Upon this award the verdicts were returned by a jury in the District Court. Judge Gray, in reversing the jury's finding, held that there was not sufficient evidence adduced before the Commission to warrant the making of the awards.

Oklahoma Roads to be Sued for Refunds.—Attorney-General West, of Oklahoma, is preparing actions against the principal railways of this State to collect the refunds due on passenger tickets sold within the State during the past three and one-half years. For conducting these actions in court the Legislature has appropriated $25,000 and the bill has been signed by Governor Cruce. The State Corporation Commission estimates the total amount due to be $5,721,646. When the Oklahoma railroads secured the injunction from Federal Judge Hook, three and one-half years ago, preventing the State from enforcing the two-cent passenger fare, it was with the provision that a coupon should be issued to the purchaser of each ticket for the additional one cent per mile charged until such time as the two-cent fare cases were decided in the highest court.

If the State is successful in collecting the full amount, fully three-fifths of the total amount will go to the State owing to the failure of ticket purchasers to save their coupons. It is estimated that anywhere from one-third to two-fifths of the coupons were thrown away. It is generally understood that the railways will oppose the payment of any coupons excepting those presented by ticket purchasers.

Suit to Annul Express Contract with Boston & Maine.—The annulment of a contract between the Boston & Maine Railroad and the American Express Company on the ground that it is unjust and inequitable to the railroad and fraudulent to the stockholders is sought in a bill in equity filed in the Superior Court at Concord, N. H., by Mrs. Clementine B. Wentworth, of Concord, a stockholder of the road.

The bill alleges that the contract has resulted in a loss of $4,000,000 to the railroad, and that so long as it remains in force the road will continue to lose $700,000 annually.

Katy Calls Halt in Texas Improvements.—President C. E. Schaff, of the Missouri, Kansas and Texas Railway, who has returned from Texas, was asked what effect the recent action of the attorney-general of that State in instituting suit against the Katy for penalties exceeding $105,000,000 for alleged violation of the anti-trust and general office statutes of Texas, would have on plans for developing the Missouri, Kansas and Texas Railway of Texas and its allied lines. He replied that all work of improvement and extension would necessarily have to be suspended, as the officers and directors could not afford to take the responsibility of expending additional money for improving and extending railroad property in Texas in the face of the hostile attitude of the State administration, manifested by this litigation.

Railway Commission of Iowa Meets Defeat on Special Rate Order.—The State Railroad Commission, of Iowa, has been defeated in its attempt to compel the railroads to make a rate of one and one-half cents for the benefit of the

Digitized by Google

State Fair. The Federal Circuit Court of Appeals has decided that the State Legislature exceeded its constitutional authority in enacting legislation establishng this rate. The court held that while the State had power to fix maximum rates, it cannot suspend such rate and make a still lower rate for the exclusive benefit of a class for a limited period.

Northern Central Lease Still in Litigation.—The Northern Central lease litigation promises to be as famous in the annals of corporation law as that of Jarndyce vs. Jarndyce is in fiction. For three years or more the matter has been pending in the courts, and there is little prospect of an end of the dilatory proceedings. The lease has been fully approved by the principal parties, the Northern Central and the Pennsylvania Railroad, but stockholders of the Northern Central Company, representing about 3,000 shares or less, have brought four suits in the courts with the idea of obstructing and defeating the lease.

While those opposed to the lease have accomplished nothing but delay, it is apparent that the case cannot be held open forever. Northern stockholders, to the extent of about 97 per cent, heartily favor the lease.

Railroads of Maryland Attack State Commission's Car Loading Order.—Railroads operating in Maryland have appealed to the Circuit Court of Baltimore from the order passed by the Public Service Commission on July 13th last extending from 48 to 60 hours the time allowed for loading and unloading freight cars on country sidings in this State. A preliminary injunction restraining the enforcement of the order was granted by Judge Harlan.

Suit Against Missouri Roads.— The assistant attorney-general of Missouri has announced that his department would institute a suit soon against the railroads of Missouri, seeking to require them to refund the money collected in excess of the provisions of the Two-Cent Law and the Maximum Freight Rates Law during the time the law was held up in the Federal courts.

The railroads declined to make refunds when proof was made of excess payment, and the department is now preparing to bring the suit.

Alabama Rate Fight.—The Western Railway of Alabama has obtained a temporary restraining order against the putting into effect of the 2½-cent passenger rate of Alabama, pending the determination of the case by the Federal Court.

STATE RAILWAY COMMISSIONS.

California.— The State Railroad Commission has ordered reductions in the express rates of Wells, Fargo & Company amounting to a cut of $750,000 for present annual revenues. Every rate of the company in this State is abolished by the order, which is effective October 1st, and over three million new rates devised by the Commission on a ten miles zone basis are ordered effective at that time.

As a result of recent fatal accidents at grade crossings, the Commission has made the following announcement: "What a few years ago were deemed unsurmountable obstacles to an under grade or over grade crossing are now treated as only engineering difficulties, which skill and capital can generally overcome. It is, therefore, the settled policy of this Commission when one railroad desires to cross another, or where it is desired that the highway cross a railroad or vice versa, to require such crossing to be made by subway or overhead crossing whenever and wherever it is practicable and feasible so to do."

Illinois.—What is expected to be one of the most vigorously contested cases relative to switching charges in Chicago ever heard by the Railroad & Warehouse Commission will be presented to that body within the next few weeks. The Chicago Board of Trade is the complainant and the defendants include the Atchison, Topeka & Santa Fe, Chicago & Alton, Chicago & Eastern Illinois, Illinois Central and Wabash road. The latter companies are accused of refusing to absorb switching charges on Illinois grain in the Chicago switching district, and, as a result, it is alleged that there has been discrimination against the Chicago Board of Trade and the grain shippers and producers throughout the State.

Kansas.—The Public Utilities Commission has granted railroads in the State authority to transport seed wheat free of charge between all points in Kansas. This was done in response to the petition of a committee of citizens from the southwestern part of the State; a district that has been seriously affected by the dry weather.

Louisiana.—In granting the petition of the Sibley, Lake Bistineau & Southern Railway Company, the Commission has discussed at length its attitude with regard to granting rate increases and the reasons which it feels are of a compelling character in arriving at a favorable decision.

The question before the Commission, the decision says is what are reasonable rates for the service performed. In considering the question, the Commission contemplates the continuance of the railroad, not its dissolution. As long as the railroad is there, the public has a right to its use, upon reasonable terms, and it is not the province of this Commission to assume that it will not be operated in good faith, for years to come. This Commission has publicly announced through its former rulings, and its proceedings before the Interstate Commerce Commission, and the Commerce Court, that this railroad will be regarded as a common carrier, and required to perform its functions as such to the full extent of its power over railroad corporations. In exercising its powers, the Commission has at all times recognized its duty to the public. It must protect their interest, and see that reasonable rates are charged, extortion prevented and discriminations eliminated. But, in performing its duties, the Commission has well settled rules of action that must be followed, and a jurisprudence that sets at rest many questions of doubt as to what it may or may not do.

The Supreme Court of Louisiana has, in four important decisions, two affecting rates and two affecting the service of common carriers, held that the Commission cannot require a service by a public carrier to be performed at a loss. When, after a full investigation, the Commission finds that the cost of performing a particular service is greater than the revenue derived therefrom, or

Digitized by Google

that the financial operations of a railroad are such that its business must be conducted at a loss, then, in fairness to all concerned, and as a matter of simple justice, it must permit such advances to be made as will aid in building up the revenues to the point where the railroad can, at least, meet its operating expenses.

This must be done with as little injury to shippers as possible. The extra cost of the service must be distributed so as to make the burden as light as possible, and as equal as possible.

Advances in rates have not been countenanced by the Commission, except in extreme cases. The Commission considers all the railroads in Louisiana necessary. Rates are ordinarily higher during development periods than when population becomes dense and traffic increases, and, when a case is presented where by an advance in freight rates only can losses be prevented, moderate advances will be allowed, subject, as are all rates, to be reduced whenever the revenues of the company justify a reduction.

The Railroad Commission has taken up for consideration the following rule for adoption:

Rule.

All railroads operating in the State of Louisiana shall give all passenger trains preference over freight trains and shall handle said passenger trains and coaches promptly on their lines, and at all junctions, stations, terminal points and river transfers.

Massachusetts.—On September 22d the Public Service Commission will give a public hearing on the question of burning oil instead of coal in the locomotives of the New York, New Haven & Hartford Railroad in the Cape Cod district. Under the new railroad law the Commission can order this change, if it desires.

This move comes from the State Forestry Department. State Forester Rane has petitioned the Public Service Commission to order that the locomotives on the New Haven lines in Barnstable County be equipped with oil burners so that oil may be used while the trains operate in that county, which includes the Cape district. The State forester explains that there always is danger of forest fires on the Cape, and that there have been an unusually large number of fires this summer owing to the dryness of vegetation, and it is found that most of the fires are set by sparks from locomotives. He says the railroad has done everything it can with its present equipment to prevent fires, has adopted spark arresters and has cleaned its right of way along the tracks.

Minnesota.—The first application ever made in Minnesota by shippers for an increase in freight rates was denied August 12th, by the State Railroad and Warehouse Commission. The application was made by Minneapolis and St. Paul wholesalers, who desired an order allowing the railroads to increase their carload rates on cereal products of grain, or reduce the less than carload rates on such cereals.

Missouri.—Martin L. Clary, of St. Louis, vice-president and general solicitor of the Missouri Pacific Railroad has applied to the State Public Service Commission August 1st, for authority to issue $28,584,500 of refunding bonds.

The Commission approved the issue. The bonds run for fifty years and draw interest at six per cent per annum.

The State Utility Commission has authorized the Chicago & Alton Railroad Company to issue $861,000 of betterment bonds, based upon a general mortgage of July 1, 1912.

The State Public Service Commission will soon be called upon to rule upon the question of switching charges. A number of complaints have reached the Commission that the roads are now exacting switching charges, which were absorbed before the maximum freight law became effective.

The Public Service Commission has received a complaint from the Kansas City Board of Trade that the trunk lines entering that city were collecting reconsignment charges on freight reconsigned at that place. The railroads claim that as the freight yards are in Kansas City, Kan., they are entitled to an additional charge in interstate business.

New Jersey.—The following notice has been sent to the stockholders of the West Jersey & Seashore Railroad:

"The Board of Public Utilities Commissioners of the State of New Jersey has withheld its approval of the lease to the Pennsylvania Railroad Company, of the railroad property and franchises of the West Jersey & Seashore Railroad Company and the latter company, having been advised by its counsel that the lease is proper and legal, both in form and substance and ought to have been approved by the said board, and that its action should be judiciously reviewed, has determined to institute such proceedings as shall be appropriate for that purpose.

"Although the lease has been duly authorized by the action of both companies, it has not yet been executed and delivered, and cannot become effective without the approval of the Public Utility Commission. If and when such approval has been obtained and the lease has been executed and delivered, it shall become effective from and as of July 1, 1913."

New York.—Because of Governor Sulzer's veto of the bill appropriating $250,000 to the Public Service Commission of the second district for the elimination of grade crossings, Commissioner Devoe P. Hodson has announced that no further hearings will be given on grade crossing abatement proceedings until the Commission is supplied with funds for this work.

Ohio.—Authority to issue $1,000,000 of five per cent equipment trust certificates has been granted by the Public Service Commission to the Hocking Valley Railroad Company. The certificates are to be sold for not less than $942,920. The road is to purchase 1,000 new 50-ton steel cars, new engines and other equipment.

The Public Service Commission has modified its recent order authorizing the Pittsburgh, Cincinnati, Chicago & St. Louis Railroad Company to issue $7,000,000 four per cent bonds to be sold at not less than 92, by permitting an increase in the interest rate to 4½ per cent. The company stated it could not dispose of the bonds at the old rate of interest.

Pennsylvania.— Pennsylvania's Public Service Commission, created by the act of July 26, 1913,

Digitized by Google

to supersede the State Railroad Commission, and to have authority over the service, rates and operation of more than a score of classes of public utilities, has been appointed by Governor John K. Tener, as follows:

Nathaniel Ewing, Chairman, Fayette County, chairman Railroad Commission from its organization in 1908, and former United States Court Judge, ten-year term.

S. Larue Tone, Allegheny County, general manager and chief engineer Pittsburgh Railways, nine-year term.

Samuel W. Pennypacker, former Governor and former Judge, member Railroad Commission, eight-year term.

Emory R. Johnson, Philadelphia, professor of transportation and commerce expert, University of Pennsylvania, seven-year term.

Milton J. Brecht, Lancaster, member Railroad Commission, six-year term.

Charles Frederick Wright, Susquehanna, banker and former State Treasurer, five-year term.

Frank M. Wallace, Erie, banker, four-year term.

The Public Service Commission has decided that no demurrage should be charged on any cars which, by reason of the frozen condition of the cargo, were incapable of being unloaded within the free period after constructive delivery and which were unloaded within that period after the condition of the coal admitted of that being done.

The opinion is the result of a complaint filed against the Pennsylvania Railroad Company by the Terminal Coal Company of Philadelphia.

Texas.—The Commission has under consideration the following proposed transit rules and regulations, the adoption of which is urged by the Texas Grain Dealers' Association: The connecting carrier rule on grain to be changed so that stopping in transit shall apply the same from any point or origin as it is on milling in transit. The back-haul and out-of-line haul to be the same rate and distance estimate, both grain products and grain, and the minimum distance adjustment to be the same on both. The six months' stoppage to be changed to ten months, with minimum of two months, where miller buys the grain that has already stopped in transit. The right to forward on transit, regardless of point or railroad line of origin, to be the same as under the milling-in-transit rule, or let the outbound line sign the outbound bill of lading on inbound expense bills via any other line. Stoppage in transit charge on oats and corn to be abolished. Regulations to be embraced in one joint circular. Readjustment of grain rates so as to reduce the excessive rates over two or more lines for short hauls and to abolish the three-line arbitrary on corn and oats.

ELECTIONS AND APPOINTMENTS.

Executive.

James M. Buick, president, Sligo & Eastern Ry. Headquarters, St. Louis, Mo.

H. M. Biscoe, vice-president, Boston and Albany Railroad.

Hon. W. Murray Crane, director, New York, New Haven & Hartford Railroad.

W. P. Clough, chairman of the Board, Northern Pacific Railway.

William C. Fordyce, president, Colorado, Kansas & Oklahoma. Headquarters, St. Louis, Mo.

J. N. Githens, assistant to vice-president, Missouri Pacific Railway Company. Headquarters, St. Louis, Mo.

Edward F. Goltra, vice-president, Colorado, Kansas & Oklahoma. Headquarters, St. Louis, Mo.

J. H. Hustis, vice-president, New York, New Haven & Hartford Railroad.

J. E. Hall, vice-president and general counsel, Hawkinsville & Florida Southern. Headquarters, Macon, Ga.

J. M. Hannaford, president and director, Northern Pacific Ry.

John H. Hunter, president, Brinson Railway. Headquarters, Savannah, Ga.

George W. Hunter, receiver, Louisiana & North West Railroad.

James Imbrie, chairman, Brinson Railway.

J. M. Johnson, vice-president in charge of traffic, Denver & Rio Grande R. R., and Western Pacific Ry. Headquarters, St. Louis, Mo.

C. W. Jones, president and general manager, Chicago, Rock Island & Gulf Ry. Headquarters, El Reno, Okla.

H. U. Mudge, chairman of the Board of Directors, Chicago, Rock Island & Gulf Ry.

Senator S. M. Porter, second vice-president, Pawhuska and Northeastern Ry.

George T. Slade, first vice-president, Northern Pacific Ry.

R. P. Stevens, president, Mahoning & Shenango Railway & Light Company. Headquarters, Youngstown, Ohio.

J. B. Tolson, president, Pawhuska and Northeastern Ry.

W. C. Tucker, first vice-president, Pawhuska and Northeastern Ry.

Theodore N. Vail, member, executive committee, New York, New Haven and Hartford Railroad.

Joseph Woods, president, Dayton & Union R. R.

Mrs. Cora B. Williams, president, Georgia, Alabama & Florida Railroad.

Frank S. Yantis, vice-president, general manager and treasurer, Colorado, Kansas & Oklahoma. Headquarters, Scott City, Kansas.

OBITUARY.

Anthony N. Brady, chairman of the Board of Directors of the Brooklyn Rapid Transit Company, died in London, England, on July 22, at the age of 71. The directors of the Brooklyn Rapid Transit Company adopted a resolution relating to his death, which is in part as follows: "For seventeen years he has been actively concerned in the direction of the company's business. During all of that period he has shown unceasing interest in its growth and development, manifesting that interest not only in the devotion of service and talents to its affairs, but in his large investments in its securities. Never for an instant has his faith in its success or his loyalty to its welfare wavered."

Vernon H. Brown, former American manager of the Cunard Line, died in New York, on August 5th. As the chief representative of the Cunard Steamship Company in New York and the United States for close upon thirty years, Mr. Brown, who was in his eighty-first year, was one of the best known men in the city's commercial life and most intimately connected with its shipping business.

Appointed American agent of the Cunard in 1880 when he was in the prime of life, he had already a strongly established reputation for his practical knowledge of the seafaring industry. He was born in Boston, November 17, 1832, was apprenticed in boyhood to the clipper shipowning firm of Sampson & Taffen, then one of the largest maritime concerns in the United States, and on reaching his majority, with his father established the shipping firm of Vernon Brown & Co., of Boston.

Coming to New York he established the firm of Vernon H. Brown & Co., which continued in the shipping business until a few years ago.

Mr. Brown enjoyed an equally high reputation in kindred commercial and social circles. He was senior director of the Hanover National Bank, being also a director of the Seamen's Savings Fund and of the Atlantic Mutual Insurance Company. He was also one of the organizers and chairman of the finance committee of the Northern Insurance Company of New York, and was one of the United States trustees of the Royal Exchange Assurance Corporation of London, Eng., besides being a trustee in the Hanover Safe Deposit Co., the Panama Railroad Company and the Sterling Salt Company. He was also a member of the Union, Tennis & Racquet, New York Yacht and Richmond County clubs.

Arthur S. Hanson, general passenger agent of the Boston and Albany for many years, died on the evening of July 29th. Mr. Hanson was one of the veterans in the railroad business in New England and had a wide acquaintance throughout this community.

In railroad circles, Mr. Hanson was regarded as an expert in passenger traffic matters, and his advice and recommendations in all matters of this sort had been regarded as of the highest authority. Practically all his railroad experience has been with the Boston & Albany Railroad and as the head of its passenger department he had extensive dealings with all classes of people along the line of this road. Mr. Hanson had also a large circle of more personal friends.

He was born in Salem on December 31, 1851, of an old Salem family, and attended the public schools in that city. He afterwards went to St. Mark's School at Southboro and then spent three years in Boston in mercantile business. In 1872 he went to Chicago, where he was employed by the Illinois Central Railroad, and six years later, on December 1, 1878, he entered the employ of the Boston & Albany Railroad in the passenger department, with which he had been continuously associated from that date. He was made assistant general passenger agent on February 1, 1882, and general passenger agent December 1, 1884.

Alexander F. McMillan, chief clerk of the passenger traffic department of the New York Cen-

Digitized by Google

tral Lines in Chicago, died August 9th, having been stricken with apoplexy on a Michigan Central train while on his way to Marshall, Mich.

Charles J. Robinson, former assistant paymaster of the Southern Pacific Company, died at his home in San Mateo, Cal., July 21st, aged 67 years.

John V. Smith, at one time president of the Alabama Railroad Commission and a member of the last State Legislature, is dead.

Edward A. Taft, manager of the express department of the New York, New Haven & Hartford, died on July 29th at his home in Boston. Mr. Taft was born in 1845, and served as captain's clerk on the gunboat "Cambridge" and the sloop of war "Tuscarora" in the Civil War. He began as clerk with the Merchant's Union Express Company in 1866, and was later made auditor of the New England Express Company, and in 1886 was made a member of the Board of Managers of the Erie Express, which later was merged with Wells, Fargo & Company. He later became a director and president of the Morris European & American Express Company, and a director and chairman of the board of the Manhattan Delivery Company.

Thomas R. Teillott, former superintendent of the Pittsburgh, New Castle & Lake Erie R. R., now a part of the Baltimore & Ohio R. R., died recently in Schenectady, N. Y.

LABOR.

Burlington Trainmen's Demands Referred to Arbitration Board.—Advices from Chicago the latter part of August, indicate that a strike affecting the trainmen of the Chicago, Burlington and Quincy Railroad, had been averted by Judge W. L. Chambers, of the National Board of Mediation and Conciliation. The questions involved will now be settled by submitting them to a board of arbitration, two of which will be chosen from each side, and these four will have fifteen days in which to choose the remaining two arbitrators, making the six necessary to hear the case. In the event of the failure of the four to select the two additional arbitrators, they will be appointed by Judge Chambers, acting as mediator. There were originally ninety-seven points in the revision of rules covering working periods. All but fifteen of these, however, have been agreed upon, but it was the settlement of these fifteen that threatened to involve the men in the strike. The men demanded an increase in wages ranging from 12 per cent to 20 per cent, depending upon the class of work. Up to the time of the appointment of the board of arbitration, the railroad rejected the demands on the ground that earnings did not warrant such advances.

Compromise on the Southern Pacific.—G. W. W. Hanger, another member of the National Board of Mediation and Conciliation, has been in San Francisco for the purpose of bringing about an adjustment of the difficulties existing between the Southern Pacific and its locomotive and tram crews. Mr. Hanger was able to effect a compromise that has satisfied all parties and averted the threatened strike. The main principle for which the employes contended, is conceded by the company. The men protested against a segregation of the steam line systems from the electric lines, extensively located in San Francisco and elsewhere. Under the terms of the agreement, the segregation plans will be abandoned.

An arbitration board has been appointed, to settle the question as to what constitutes electric street car service on the lines of the Southern Pacific Company. At the suggestion of E. E. Calvin, vice-president of the Southern Pacific, Commissioner Hanger on behalf of the people, appointed Max Thelan, of the California Railroad Commission, as a member of this board. Representing the employes will be M. E. Montgomery, assistant chief engineer of the Brotherhood of Locomotive Engineers, while W. R. Scott, general manager of the Southern Pacific, will attend on behalf of the railroads.

The railroad company contends that certain of its electric cars in Alameda County, which are operated under a street car franchise and stop at every crossing, should be run on a different basis from through suburban service stopping only at regular stations.

This triangular board is a striking illustration of the change in attitude toward strikes in the last few years. Its formation recognizes that the people are entitled to have something to say in transportation matters, and that the railroad company and the men both realize it. Coming from the railroad, the suggestion that the people's representative be included indicates closer co-operation between the two in the future.

Baltimore and Ohio's Machinists Strike Averted.—An agreement between machinists and officials of the Baltimore and Ohio has been signed as a result of the good offices in mediation of the Department of Labor. An adjustment of several points of differences was brought about and an agreement signed averting the threatened strike. John A. Moffit, of the Immigration Service in New York, acted as mediator for Secretary Wilson.

The agreement runs for one year, beginning September 1st. It provides for a nine-hour day, an increase in wages, from 35 to 36 cents an hour, better sanitary and safety conditions for the machine shop and locomotive employes, regulation of apprentices, and a minimum wage scale. The agreement is expected to end the troubles between the road and its machinists, which have continued since the strike of 1910. It is the first agreement signed since 1908.

Northern Pacific Machinists Receive Wage Increase.—Machinists and helpers on all lines of the Northern Pacific and Great Northern railroads have effected a compromise with road officials, and will not strike. Some time ago the workers took a strike vote, asking as an alternative that they be given an eight-hour day, a cent an hour increase in pay and modifications in rules regulating the methods of work. Duluth railroad men have been notified by heads of the machinists' organization in the Twin Cities that their demands, with the exception of the one covering an eight-hour day, have been granted. As a result of the new ruling, 43 cents an hour will be the minimum on Great Northern lines east of Minot, N. D., and 45 cents the minimum

Digitized by Google

west of that point. Mandan, N. D., is the dividing line of the Northern Pacific.

Advice to Ignore Orders.—A clash between the Brotherhood of Railway Trainmen and general managers of all roads may result from a letter sent out by W. G. Lee, head of the employes' order. Mr. Lee, in substance, advises all trainmen to disregard orders of railway officers when such orders violate the schedules and agreements entered into by the two interests. Officers of roads who have received the circular say it means an interference with discipline which, if carried out, must relieve the officials of responsibility to the public.

For years railway officers have contended before wreck investigators and in other ways that the rules of the different railroad brotherhoods and their manner of interpretation often run counter to the orders of the officers and in this way there was insubordination, lack of discipline and danger to the public. The letter quotes the resolutions passed at the convention of the men and charges that railway officers misinterpret or violate articles in schedules made with the men.

Longshoremen Strike Terminated.—The strike of longshoremen on the Hoboken docks of the Hamburg-American Line has come to an end, and all of the men have returned to work, following the issuance of an ultimatum by the company that it would not discriminate in the employment of its men.

The company stated that it did not desire to discriminate, its policy being to treat the men fairly at all times, and to give each one an opportunity of employment. It refused to submit to any of the demands of the longshoremen, and asserted that in three weeks they would reinstate the brass-check system, but reserved the right to withdraw the checks from any individual or individuals whom they consider objectionable.

TRAFFIC.

Developments During August.—Railroads during the month of August handled considerably more freight than they did for the corresponding period in 1912. Towards the end of the month there appeared to be a slackening in certain lines, but not to any important extent. Notwithstanding the heavy movement, the car situation remained satisfactory, although there is fear expressed in some quarters that a considerable shortage will exist during the winter months, particularly should weather conditions become unusually severe. The one big unfavorable development for the month was the serious deterioration in the corn crop. The damage has been very general in Kansas and surrounding States, and it is reported that the loss could be scarcely exaggerated. It is estimated to be 400,000,000 bushels and upwards. Other crops in the main, however, are doing well, and while the railroads will lose from the decreased corn tonnage, increases along other lines may offset the loss. In spite of the passage of the tariff bill, the outlook for business is generally good, and liberal attendance of buyers is reported at various trade centers, with good purchases.

Foreign trade continues heavy, its highest record being reported both for July and for the fiscal year ending July 31st. While the imports for the seventh month fell slightly below those for a like month of 1912, the exports were so much larger by like comparison, as to make the grand total the largest ever recorded. On the Great Lakes, July showed a large increase of lake traffic, the tonnage passing through the Sault Ste. Marie for the month being 12,278,000 tons, against 10,781,000 for the same month of last year. All important items show a gain with grain in the lead.

In the East, shipments of anthracite coal from Pennsylvania in July, were nearly 800,000 tons less than those in July, 1912, and amounted to 5,487, 852 tons as against 6,285,153 tons last year. The entire shipments for the first seven months of the year, however, were over 40,000,000 tons, and it is probable that this year's production will exceed the high record of 1911, which, for the twelve months, was 69,954,299 tons.

Summer passenger traffic has been reported from all sections of the country as being unusually heavy, and likely to eclipse all previous records. It is also reported that indications point to an exceptionally heavy volume of colonists passage business during the fall months, and plans have already been made to provide for this expected increase in travel. Special fares will apply to points in California, Oregon, Washington, Utah, Colorado, Nevada, Montana, Idaho and British Columbia.

Latest reports as to trans-Atlantic passenger movements, show a new record. While the total of first-class passage eastbound, from January 1st to August 15th, was only seventy behind the total for the corresponding period of 1911, the second-class, eastbound total, was a new record, likewise the first and second-class westbound movement. The immigrant record for the year is far greater than ever before recorded.

Erie Installs Car Floats in Chicago.—The first line of car floats to be operated at Chicago, has been inaugurated, the Erie Railroad having established a service to down-town points. This service, which contemplates sending full cars of merchandise into the heart of the wholesale district, is expected to give the Erie a considerable advantage both in point of time and in point of service. The plan of the company is to divert full car shipments from the main line of the railroad in the yards at the south side of the city. For this purpose a spur line has been built to a float bridge where the cars will be placed on barges and towed on the river to their destination. Each barge will be capable of carrying eight freight cars.

New Parcel Post Rates.—On August 15th, further extensions of the parcel post system were inaugurated. These included an increase of the maximum weight to twenty pounds, and a reduction in rates on first zone deliveries. A further extension of the parcel post system is forecasted in a statement issued by the Postoffice Department. This statement says in part:

"The Postmaster-General and his committee are continuing to work from day to day for the purpose of analyzing further phases of the service, and keeping in touch with the operation of the changes already announced, with a view of further extending the usefulness of this service just as soon as the necessary investigations and experience indicate that this is advisable."

VOL. LVII. OCTOBER, 1913 No. 10

Important Developments in the Transportation Field

ARBITRATING THE EASTERN TRAINMEN'S WAGE CONTROVERSY

The arbitration of the Eastern trainmen's demands for greater pay and certain changes in working conditions began on September 12th, in New York at the Hotel Manhattan and continued through that month and the first half of October. Sessions began at 9.45 in the morning and continued until 12.30, were resumed at 1 P. M. and continued until 3.15. With the exception of Saturday and Sunday, meetings were held on every day. The Honorable Seth Low, by common consent, was made chairman of the Board of Arbitration and H. S. Milstead was elected secretary. Other members of the Board as recorded in last month's issue, were A. H. Smith, vice-president of the New York Central, W. W. Atterbury, vice-president of the Pennsylvania Railroad, Daniel L. Cease, editor of the *Railway Trainmen*, and Richard E. Sheppard, vice-president of the Order of Railway Conductors. The two former represented the railways and the two latter the employes. John H. Finley, president of the College of the City of New York, and Chairman Low, president of the National Civic Federation, represented the public on the Board.

During the course of the proceedings, the trainmen first presented their case in a general manner and were followed by the railroads. The trainmen's witnesses were then produced, were examined and cross-examined. Following the testimony by these witnesses, direct evidence was offered by the trainmen and by the railroads and a final summing up preceded the submitting of written briefs of each side to the other. Chairman Low in a public statement previous to the inauguration of the hearings, said:

"These proceedings are of great moment, as they will test for the first time the new law on arbitration passed by Congress, July 15, 1913. It will be shown if the new law is to work well in solving the railroad problems of the day."
